marck, after profound study, began in 1878 to advocate protection. In 1879 the Reichstag returned to it by a vote of 217 to 117. In two years the exports of manufactures increased 33 per cent.; in eight years the number of artisans in iron and steel increased 30 per cent., their aggregate wages increased 27 per cent., and the average wages in all industries increased 12 per cent. The payment of a bounty on the exportation of sugar caused production to increase from less than 200,000 tons in 1871 to more than 1,000,000 tons in 1891. There was activity in all employments. Machinery improved and skill increased. Wages, though from 98 to 226 per cent. higher than in 1848, were still so much lower than in England that German goods found an increasing market there, to the depression of many British industries and to the ruin of some, and they were even able to overcome many of the duties of the United States and undersell the products of some of the best established industries in this country. From 1875 to 1886 the exports of manufactures of silk increased 884 per cent.; woolens, 296; cottons, 302; glass, 264; paper, 322; spirits, 258; beer, 446; and machinery, 260 per cent. Industries became diversified as never before in any country, and from 1878 to 1896 schools for technical and manual training were established in 328 places. All these marvelous figures utterly disprove the theory of free trade that protection dulls and dwarfs the individual and cramps and curtails the aggregation.

Russia, the wonderland of two continents, affords a most striking example of the influence of protection to convert barbarism into civilization and transform deserts into cities and gardens. Russia entered upon its career as a modern power with the reign of Peter the Great, which began in 1689. That enlightened monarch worked *incognito* in the ship yards of Holland, that he might teach his people how to build ships. When he visited

Protection in Russia.

England, though tendered kingly honors, he took private lodgings and studied the laws and industries. Through "dropping pearls and vermin," and leaving evidence in his lodgings that "a barbarism had been there," he took away about all that was to be learned, at that time, of national development. This knowledge was applied at home under the disadvantages of popular ignorance, but in a thousand ways Russia was transformed. Agriculture, manufactures, and commerce became established. In treaties and decrees the protective principle was carefully observed. Near the close of the seventeenth century, or contemporaneously with the United States, Russia adopted a tariff of protection, and in many cases of prohibition. Again, as in the United States, this policy was relaxed in 1816-19, but returned to in 1822 and maintained until 1849. In the revisions of 1851 and 1854 prohibitions were generally abolished and the duties made discriminating, as suggested by economic changes. The same policy was adhered to in the revisions of 1867 and 1876; the last increasing the protection. A new revision, on the

same lines, was begun in 1887 and completed in 1891. In these later and scientific tariffs, Napoleon's idea of subordinating revenue to protection prevailed. The general results of a century of protection were progress in every domestic industry, a favorable balance of trade, and a steady gain in employment and wages. In 1894 Russia produced nearly two billion bushels of grain, and more than one and a quarter billion pounds of cotton. In 1890 the output of the mines and factories was valued at \$828,000,000. Of the European countries, Russia is second to only England in cotton manufacturing; having 6,000,000 spindles in 1892. Woolen, silk, leather, lumber, flour, and tobacco are all important and growing industries. There are 65,000 factories of all kinds, employing 1,000,000 people. From 1884 to 1896 the sugar industry increased 100 per cent., iron 68, steel 59, coal 129, and petroleum, 1475 per cent. Wages have advanced, but are still low; being from \$80 to \$150 a year for men in the cotton mills, and but a trifle more than half that for women. Most of the mills are run from 9 to 12 hours a day.

Other Europe.—The progress of other European countries under protection compares favorably with that of the great countries named. Apparently protection is their settled policy. All their self-governing colonies in every part of the world have adopted it also, and in all of them progress has been relatively greater than before. Schemes for an imperial customs union between the United Kingdom and the Colonies of Great Britain have for several years been under discussion; the proposed basis being protection against the world and preferential duties or free trade among themselves. The manufacturing Colonies shrink from it on account of England's supremacy, and England shrinks from it because of not being ready to abandon free trade.

II. PROTECTION IN THE UNITED STATES.

The agitation for protection began in the Colonial period, partly because of England's oppressive laws to prevent manufacturing in the Colonies, and partly because of the depression of industry from the use of foreign goods. In 1767 the inhabitants of Boston voted in town meeting, and afterward signed a pledge not to buy the "foreign superfluities" mentioned in a long list. The Articles of Confederation, under which the country was governed from 1781 until the ratification of the Constitution in 1787, permitted each State to regulate its own commerce, and this made a general tariff impossible. The States were deluged with foreign goods. Distressed working men and merchants in the principal cities united in great petitions for protection. To meet this want was one of the chief reasons (Daniel Webster said it was "the leading cause") for forming the "more perfect Union" spoken of in the preamble to the Constitution. The second act of the First Congress which assembled under the new Constitution was a tariff, the object of which, as declared in the preamble, was "for the support of government, for the discharge of the debts of the United States,

and for the encouragement and protection of manufactures." This passed the House by a vote of more than five to one, and the Senate by a unanimous vote, and was approved by George Washington, July 4, 1789. From that time to 1896 fifty general tariff laws were enacted, all of them in some degree protective. There was no departure from the protective policy until 1816, and the new duties of that year were intended to be ample, but they

Early History.

proved insufficient against the destructive commercial war which England determined to wage. In a speech in Parliament, Lord Brougham declared that "it is worth while to incur a loss upon the first exportation, in order, by the glut, to stifle in the cradle those infant manufactures in the United States which the war has forced into existence." While in 1813 imports were only \$13,000,000, in 1818 they had risen to \$121,750,000. An adverse balance of trade of \$229,000,000 had been created, and industry was everywhere depressed. In 1824 a more protective tariff was passed, and it was strengthened in 1828. Under both tariffs the country prospered. But meanwhile the tariff had become a sectional question. The cotton-planters of the South, whose principal market was in England, were led to adopt the free-trade ideas of Sir Robert Peel, and under the lead of Mr. McDuffie of South Carolina, they advanced the strange theory that, by selling cotton to be manufactured in England, they were manufacturers themselves, and as much entitled to government favor by exemption from duties on the imports with which they were paid as the cotton manufacturers of New England were by the imposition of duties upon competing goods. Resentful of Northern hostility to slavery, they favored England instead of New England; reasoned that protection is paternalism; decried the tariff as "a local question," and threatened to secede from the Union. Wishing to avert this calamity, Henry Clay, the greatest of the protective statesmen except Daniel Webster, proposed a compromise tariff, which became a law in 1833, which took the form of a sliding scale of biennial reductions to uniform duties of 20 per cent., to be reached in 1842. Of course, such disregard of discrimination, which varying costs of production require in a protective tariff, as well as the lower duties, proved disastrous to both revenue and business, and this, complicated with a banking question, produced a great panic in 1837. In the tariff of 1842, the country returned to protection, but in 1846 the South again prevailed, and the "Walker tariff" of that year made heavy reductions in the duties that protected manufactures. The disastrous effects were referred to by Presidents Fillmore in 1852, and Buchanan in 1857, but owing to causes other than the tariff, the country enjoyed some measure of prosperity. When those causes

War Tariff.

ceased to operate a panic ensued in 1857, and in 1861 the "Morrill tariff," which returned to protection, was enacted a short time before the outbreak of the Civil War. During the war many

duties were increased, the prime object being revenue, because the war itself proved a great stimulus to industries. When peace was restored free traders raised a clamor for the abolition of the war tariffs. Changes were made in 1867, 1870, and 1872, most of which were extensive reductions. Importations, which had already become large as a result of extravagance, incident to an inflated currency, then increased, the country had an adverse balance of trade, and in 1873 there was another panic. In 1875 a more protective tariff was enacted and prosperity returned. In 1883 what was supposed to be a scientific readjustment of duties, recommended by a commission of experts, was made, but economic changes which they did not anticipate caused it to practically fail, like the tariff of 1816. Again business suffered, but the McKinley tariff, of more discriminating duties, and with a reciprocity clause and improved administrative features, was enacted in 1890, and during its three years' operation both production and commerce prospered as never before. More people were employed, and at higher wages, the public debt was reduced \$252,000,000, new industries sprang into existence, there was a favorable balance of trade, the public credit reached its highest figure. But the extensive free-trade propaganda denounced the duties as excessive and misled enough voters with the false statement that "prices had advanced all along the line," to reverse the policy at the next elections. The Democratic party promised to introduce free trade, but its candidate promised that nothing should be done to hurt the industries. Both promises failed. The Wilson bill of 1894 did not even pretend to frame schedules on free-trade principles; it was simply a reduced McKinley tariff, but so much reduced that Southern senators from coal and iron producing States refused to accept it, and raised certain rates. President Cleveland denounced this as an act of "perfidy and dishonor," and allowed the bill to become a law without his approval. Some of its duties proved fairly protective; others invited increasing imports, and when the market became flooded with foreign goods, domestic industry collapsed. A deficiency in revenue, coupled with an intimation by a Secretary of the Treasury, with an unsound financial record, that public obligations might be paid in depreciated silver, caused a panic in the early summer of 1893, and though that was soon over, there has been no general prosperity since. The public debt has increased by nearly \$300,000,000, the public credit has fallen to a humiliating figure, there is an adverse balance of trade, unemployment has increased in nearly all industries, wages have fallen, trade has declined, general discontent prevails, and there is every evidence that the elections this year will restore the protective policy with instructive emphasis. During 106 years the United States had about 75 years of effective protection. In every protective period it prospered, and as a result it has become the first nation in agriculture, mining, and manufactures, and its industrial population is the best conditioned of any in the world.

III. THE PRINCIPLES OF MODERN TARIFFS.

These are easily understood. The difference between a free-trade tariff and a protective tariff is not so much one of low or high duties, as it is the choice of articles to which duties shall be applied. England's free-trade tariff raises approximately as much revenue as America's protective tariff. But free trade applies duties to articles which must be imported, because they are wanted and are not produced in the country; protection admits such articles free, so as to cheapen their cost, and applies duties to articles which do not need to be imported, because they are or can be produced in the country. England derives a large revenue from tea and coffee, not a pound of which is raised at home; the United States has admitted them free of duty since 1872. England admits cottons and woolens free, although producing them; the United States subjects them to duty, so that more of them may be produced here. If England's need of revenue requires a duty to be placed upon an imported article like what is produced in the country, an excise is put upon the domestic product to countervail the duty, so that the duty will not be protective. In the United States, if duties fail after due trial to develop a domestic supply in quantities adequate to reduce the price to a fair level, they are removed, so as not to increase the cost of living. It is claimed by protectionists that the duty is never added to the price, except when the people are dependent upon foreign supply. When they are dependent, the duties on goods sent here to compete are paid by the foreigners in a form of a lower price. This claim is not only admitted by exporters to protective countries, but is proved by prices, most of which are as low as those abroad, all of which are lower after than before protection, and many of which are actually lower than the duties themselves. In the last case the duty might be dispensed with, but it does no harm to consumers, and protects producers from bankrupt stocks or from the destructive prices that Lord Brougham advised.

There has been much misleading talk about "high tariff" and "low tariff." A tariff may be very high and yet not in the least protective, or very low and yet sufficiently protective. All this depends upon the objects to which duties are applied and the conditions of their production and distribution. And since the duty cannot be added to the price when there is strong domestic competition, no consumer need care how high it is. But if it falls below the line of protection, domestic competition is crushed, and then the importer can add the duty to his price.

Under both free trade and protection duties are either specific or *ad valorem*, and sometimes both. A specific duty is so many cents per pound or yard, or other unit of quantity. An *ad valorem* duty is such a percentage of value. The former requires only counting or weighing at the custom-house, but the latter requires appraisal. It is difficult to ascertain the value of foreign goods, and they are often invoiced far below their true value, so as to

cheat the customs. This deprives the Treasury of part of its expected revenue and deprives domestic producers of a part of their promised protection. The tariffs of all foreign countries are now almost wholly specific. In America protectionists favor specific duties, but free traders generally favor *ad valorem*s. *The effect of tariffs upon wages* has long been a subject of dispute. Perhaps the most accurate statement is that they neither raise nor lower wages except as they increase or diminish employment. If the goods we consume are made abroad, we do not make them ourselves, therefore labor suffers. Wages in Europe average from one-third to two-thirds those in the United States; in India, China, and Japan, from one-tenth to one-fifth the rates paid here. These comparisons are based on the relative productivity of labor and machinery. And as the cost of ocean transportation is now but a small percentage on the cost of the goods, the only way to secure employment and good wages in this country is to have duties that will at least equal the difference in the labor cost of production between those countries and this. Thus the tariff question is largely a labor question.

Effect upon Wages.

ALBERT CLARKE.

PROTESTANT EPISCOPAL CHURCH AND SOCIAL REFORM.

—For a statement of one view of social reform held in the Protestant Episcopal Church, see ANGLICAN POSITION. For a statement of the activities of the Protestant Episcopal Church in social reform, see CHURCH ASSOCIATION FOR THE ADVANCEMENT OF THE INTERESTS OF LABOR; CHURCH SOCIAL UNION; INSTITUTIONAL CHURCHES. Many believe that the Protestant Episcopal Church leads among the religious societies of the United States in its activities in social reform. The existence of the above-mentioned

societies, the activities and utterances of such men as Bishop Huntington of Central New York, Bishop Potter of New York, Bishop Sessums of Louisiana, with such clergymen as the Rev. W. S. Rainsford, D. D.; Rev. R. Heber Newton, D. D.; Rev. R. H. Holland, S. T. D.; Rev. James Huntington, O. S.; Rev. J. D. Peters, D. D.; Rev. W. D. P. Bliss, Rev. Philo Sprague, with such laymen and women as Professor Ely, Miss Vida D. Scudder, and many others, go far to substantiate this view. Referring to the above articles for details, we give here a significant extract from the pastoral letter of the Bishops of the Church in 1889:

"In a country such as ours, distinguished among the nations by institutions which presuppose the liberty, intelligence, and civic virtue of the citizen, it is of the utmost importance that men should feel and recognize their political responsibility. And while the Church of God—the kingdom not of this world—does not undertake to wage the warfare of the partizan, it is nevertheless charged with the duty of establishing and maintaining principles which shall find expression in the political as well as in the social and family life. The Incarnation would be emptied of a large part of its significance if it were supposed to leave untouched and uninfluenced the life of men under the ordered polity of the commonwealth. To 'render unto Cæsar the things that are Cæsar's' is surely more than the due payment of the tribute-money which supports the public action of the State. It is, no less, the righteous and godly exercise of all the functions of the citizen. On account of the dangers which beset all government, the far-seeing founders of the republic rested their hopes for its welfare and success upon the civic fidelity of the people—not upon the excellence of our governmental methods. Those methods make possible among us gross and shameful perversions of political right and authority. It has come to pass, in the heat and eagerness of party struggle, that vicious and corrupt conduct is largely condoned, and the standards of political morality are sensibly and dangerously lowered. We are confronting a great peril—and one which must excite the fears of Christian men—lest character fashioned in the working of free institutions be irretrievably damaged, and the poison, entering here, spread itself throughout the entire life of the nation. Purity and integrity in the administration of public affairs are strenuously demanded by the religion of Christ, as well as by all patriotic aspiration. Official place, in morals and in politics, is not the prize won by a vulgar selfishness, nor the refuge of patronized incompetence, nor yet the barter price promised or paid for political influence, but the place in which a righteous man may serve his fellow-men and advance the reputable interests of his country. The emoluments of

Morals.

office are derived from a fund contributed to the State by the loyal obedience and patient toil of the industrious masses; to say the very least, it should be distributed so as to secure the most efficient and economical conduct of public affairs. The honors of office are legitimate rewards bestowed by popular confidence upon upright citizenship. It must be an evil day for our country when both emoluments and honors are made the prey of a partizan activity which often discards all honesty in its methods and renounces all shame in its corrupt and corrupting success. The religion of Christ is 'for the healing of the nations' sick with sin and wrong; and the Church of Christ, while holding itself aloof from the strife of faction and party, is yet called upon, in the persons of its members, to guard jealously the great heritage which God's providence has bestowed, and to maintain earnestly the beneficent ideals of political life and action. To answer that call with ready mind and will is the becoming office of faithful men who would promote the righteousness which 'exalteth a nation,' and invite still further blessings from Him who 'hath brought us forth into a wealthy place' among the peoples of the earth.

"We pass on to a kindred topic. It is inevitable that the Church of God shall be profoundly concerned at the disturbed relations of what are commonly called the 'industrial classes'—the wage-workers and

the employers of human labor. The spirit of our holy religion forbids indifference, on our part, to any actual trials, oppressions, or sufferings of men, and its due practical operation has tended always to do away with jealousies, suspicions, and antagonisms between the children of the One Father of us all. We may confidently claim for the Church of Him who by His presence consecrated the carpenter shop of Nazareth that, however, at any time or place it may have been tempted to shelter itself under the patronage or protection of earthly power and wealth, nevertheless its deep, constant purpose has been to soften asperities of feeling, to promote mutual good will, to curb injustice, as between man and man. And if there be, as unhappily there often is, a forgetfulness by many of the blessed changes wrought in human conditions by Christ's religion, we may not ignore the significant truth that the unchallenged claim of men of our day to considerate justice and all righteous recognition by their human brothers rests finally and completely upon the dignity and sacredness of the humanity taken into the Godhead by the Word made Flesh, and by Him redeemed unto the liberty of the children of God.

"It is painfully evident that the existing industrial system is subjected not only to vehement criticism, but to perilous strain; and one of the most discouraging elements of the situation seems to be the hopeless or despairing tone of those who deal with the overshadowing questions which throng so persistently upon the mind and heart of our generation. It seems scarcely to be expected, by many, that a solution of the problems can be reached by applying to them any devices of human sagacity or any reconciling principles of economic science.

"It is often assumed without question, alike by reckless passion and thoughtful earnestness, that there is no soothing for the uneasy world; that opposing interests and aims are here met in mortal strife. We do not venture to intimate that we have any swift and potent cure for the evils which we must and do deplore. But we are confident that it is a fallacy in social economics, as well as in Christian thinking, to look upon the labor of men, and women, and children, as a mere commercial commodity to be bought and sold, as an inanimate and irresponsible thing. It is the employer who seeks and finds the inner soul of the operative, who respects his manhood, and perhaps translates for him into fact the inarticulate longings of his better nature; it is the master whose watchful sympathy finds room and play in the cottages of his wearied workmen, and in all the life which has its centers there—it is he who has found the open secret of a wisdom that is 'peaceable' because it is 'from above,' and is 'pure,' 'gentle,' and 'easy to be entreated.' Any social philosophy which eliminates from its consideration the value and significance of human feeling, or human susceptibility to the influence of kindness, justice, and loving manliness, has surely left itself fatally maimed and incomplete. The heart and soul of a man cannot be bought or hired for money in any market, and to act as if they were not needed, in the doing of the world's vast work, is as unchristian as it is unwise. We may not therefore omit to urge, upon all those to whom our words may come, the profound need of a righteous and full appreciation of the moral and spiritual factors which enter into industrial questions. To bear in mind the hardships and heavy cares of our brother men; to remember our common kinship in the great family of God; to ponder their necessities; to stand ready and glad to plead their cause; to brighten their lot and comfort their distresses—this is the exalted office of Christian men—it is the hopeful method of peace and good will. And let it never be forgotten that there is here a reciprocal obligation laid upon labor—a duty defined by every principle of righteousness and truth. That duty—a duty fully and fitly recognized by large numbers of Christian working men—plainly is to treat the employer, in his most difficult position, with all considerate and thoughtful regard. His legitimate interests may not be ignored, and it should be the steadfast will and purpose of his working associates to protect those interests and defend them against all unjust aggressions. He is frequently placed in situations of great embarrassment, and the kindly patience and sympathy of his workmen may bring relief. He is always entitled to that, and there is grave injustice when it is withheld. Combinations which cripple or hinder his rightful freedom of action, unreasonable demands concerning

Wage Question.

the hours and compensation and division of labor—these are not in the way of substantial right, and any temporary or passing triumph for them is but the delusive promise of a method, bad in morals, which really invites and compels disaster. The stars in their courses through God's sky of truth fight against ungodliness and wrong, and they who would claim equity must do equity. In considering these relations between employers and employed, we desire to express our profound interest in the provisions that may be and should be made for penetrating the life of the great masses of men with positive Christian influence. If the world's exacting labor is to be done in any accord with the principles of the Kingdom of God, there must of necessity be, on the part of employers, a distinct and unqualified recognition of the spiritual needs and claims of the workmen whose toil they control or direct.

"In the law of God there is a day which he calls his own, and by the declaration of the Lord Jesus Christ it was 'made for man.' It is doubly protected then by the sovereignty of God and by the everlasting sanctity of a human right; the Holy Day—thus guarded and shielded against invasion—is the day for worship and for rest. To rob it of its character at the demand of greed; to make labor so weary under its daily burden that it is tempted and almost forced to change its day of high and holy refreshment into a day of reckless indulgence or soulless apathy, is grievous sin. We are enabled to thank God for the good examples of some of our brethren, who have been forward to minister graciously and helpfully to large bodies of operatives in their employ. They have provided for needed rest, for helpful and elevating recreation, for due demands of human frame and human spirit. Let the examples be multiplied, and let the Church of God interpose its protest against oppressive wrong."

PROUDHON, PIERRE JOSEPH, was born the 15th of January, 1809, in Besançon, France. His father worked in a brewery; his mother was a peasant servant. The boy herded cows and did the humblest work. He early, however, displayed a love of study, and, borrowing books from the town library, he read, and went to the day-school when his work allowed. At 16 he entered the college of his native place, tho he still could not buy the necessary books, and had to borrow them from his mates in order to copy the lessons. There is a story of the young Proudhon returning home laden with prizes, but to find that there was no dinner for him. At the age of 19 he found work in a printing house, and, by correcting proof, he acquired knowledge on many lines, though particularly in theology; learning Hebrew too, as well as Greek and Latin. He was thus enabled to contribute some articles to an *Encyclopedie Catholique*. In 1836 he established, with a friend, a small printing-office in Besançon, but his partner committing suicide, he had to wind up the business in 1838. In 1837, however, he had written an *Essay on General Grammar*, and he now obtained the Suard pension of 1500 frs., granted by the Academy of Besançon. This enabled him to go for a while to Paris, and to compete, unsuccessfully, for a prize essay on the subject of *The Celebration of Sunday*, in which he first broached liberal social ideas.

In 1840 he published his first work, *Qu'est-ce que la Propriété?* giving his famous answer to the question, "La Propriété, c'est le Vol" (Property is Theft). It attracted little notice, and the sole results to its author were the withdrawal of his pension by the Academy, on the score of his noxious opinions, and the threat of a prosecution. In 1842, for a repeti-

tion of offense in his *Avertissement aux Propriétaires*, he was prosecuted before the Cour d'Assises of Besançon, but succeeded in obtaining an acquittal. From 1843 to 1847 he was employed at Lyons, in the superintendence of a scheme of water-transport on the rivers Saône and Rhône; publishing during this time at Paris the two works entitled *De la Création de l'Ordre dans l'Humanité*, and *Système des Contradictions Économiques*, his most important works, and written under the influence of Hegel, Adam Smith, and the Bible. In 1847 he left this employment and finally settled in Paris, where he was now becoming celebrated as a leader of innovation. He regretted the sudden outbreak of the revolution of February (1848), because it found the social reformers unprepared. But he threw himself with ardor into the conflict of opinion, and soon gained a national notoriety. He was the editor of the *Représentant du Peuple* and other journals, in which the most advanced theories were advocated in the strongest language; elected member of assembly for the Seine department by 77,094 votes, he brought forward a proposal to exact an impost of one-third on interest and rent, which was rejected. He had various political struggles with the Mountain and other political factions, whom he accused of favoring socialism only in pretense. He fought a duel with Félix Pyat and denounced Louis Bonaparte, who was already preparing his *coup d'état*. He succeeded only in being prosecuted himself and condemned to a fine of 10,000 frs. and three years' imprisonment. He fled to Belgium. This broke up an attempt he had made to found a bank which should operate by granting gratuitous credit. Of the 5,000,000 frs. which he required, only 17,000 were offered, and the bank was closed by the authorities, instigated by the hostility of the moneyed class. Proudhon only remained in Belgium a few days. Returning to Paris in disguise, he was discovered, arrested, and imprisoned three years. During this time he married a young working woman. He wrote during these years his *Confessions d'un Révolutionnaire* (1849), *Actes de la Révolution* (1849), *Gratuité du Crédit* (1850), and *La Révolution Sociale Démontrée par le Coup d'État* (1852); the last of which is remarkable for the clearness with which he states the alternative of *l'Anarchie ou le Césarisme*, as expressed in Louis Napoleon, then President. In June, 1852, he was set at liberty, and lived, writing, in comparative quiet, till the publication of his work, *De la Justice dans la Révolution et dans l'Église* (1858), in which he attacked the Church and other existing institutions with unusual fury. This time he fled to Brussels to escape imprisonment. On his return to France his health broke down, tho he continued to write. He died at Passy, January 19, 1865.

Thomas Kirkup says of Proudhon (article *Proudhon*, *Encyclopædia Britannica*, 9th ed.):

"Personally Proudhon was one of the most remarkable figures of modern France. His life was marked by the severest simplicity and even Puritanism; he was affectionate in his domestic relations, a most loyal friend, and strictly upright in conduct. He was strongly opposed to the prevailing French socialism of his time because of its utopianism and

immorality; and, though he uttered all manner of wild paradox and vehement invective against the dominant ideas and institutions, he was remarkably free from feelings of personal hate. In all that he said and did he was the son of the people, who had not been broken to the usual social and academic discipline; hence his roughness, his one-sidedness, and his exaggerations; but he is always vigorous, and often brilliant and original.

"It would, of course, be impossible to reduce the ideas of such an irregular thinker to systematic form. In later years Proudhon himself confessed that 'the great part of his publications formed only a work of dissection and ventilation, so to speak, by means of which he slowly makes his way toward a superior conception of political and economic laws.' Yet the groundwork of his teaching is clear and firm; no one could insist with greater emphasis on the demonstrative character of economic principles as understood by himself. He strongly believed in the absolute truth of a few moral ideas, with which it was the aim of his teaching to mold and suffuse political economy. Of these fundamental ideas, justice, liberty, and equality were the chief. What he desiderated, for instance, in an ideal society was the most perfect equality of remuneration. It was his principle that service pays service; that a day's labor balances a day's labor—in other words, that the duration of labor is the just measure of value. He did not shrink from any of the consequences of this theory, for he would give the same remuneration to the worst mason as to a Phidias; but he looks forward also to a period in human development when the present inequality in the talent and capacity of men would be reduced to an inappreciable minimum. From the great principle of service as the equivalent of service is derived his axiom that property is the right of *aubaine*. The *aubain* was a stranger not naturalized; and the right of *aubaine* was the right in virtue of which the sovereign claimed the goods of such a stranger who had died in his territory. Property is a right of the same nature, with a like power of appropriation in the form of rent, interest, etc. It reaps without labor, consumes without producing, and enjoys without exertion. Proudhon's aim, therefore, was to realize a science of society resting on principles of justice, liberty, and equality thus understood; 'a science absolute, rigorous, based on the nature of man and of his faculties, and on their mutual relations; a science which we have not to invent, but to discover.' But he saw clearly that such ideas, with their necessary accompaniments, could only be realized through a long and laborious process of social transformation. As we have said he strongly detested the prurient immorality of the schools of Saint-Simon and Fourier. He attacked them not less bitterly for thinking that society could be changed off-hand by a ready-made and complete scheme of reform. It was 'the most accursed lie,' he said, 'that could be offered to mankind.' In social change he distinguishes between the transition and the perfection or achievement. With regard to the transition he advocated the progressive abolition of the right of *aubaine*, by reducing interest, rent, etc. For the goal he professed only to give the general principles; he had no ready-made scheme, no utopia. The positive organization of the new society in its details was a labor that would require 50 Montesquieus. The organization he desired was one on collective principles; a free association, which would take account of the division of labor and which would maintain the personality both of the man and the citizen. With his strong and fervid feeling for human dignity and liberty, Proudhon could not have tolerated any theory of social change that did not give full scope for the free development of man. Connected with this was his famous paradox of *anarchy*, as the goal of the free development of society, by which he meant that through the ethical progress of men government should become unnecessary. 'Government of man by man in every form,' he says, 'is oppression. The highest perfection of society is found in the union of order and *anarchy*.'

Proudhon is considered the father of the school of the philosophical anarchists (see ANARCHISM), tho he held their views only in the germ and not in their developed form, and he has found, as he predicted, his chief following in the United States.

The principal works of Proudhon have already been mentioned. A complete edition,

including his posthumous writings, was published at Paris, 1875. See, also, *P. J. Proudhon: sa Vie et sa Correspondance*, by Sainte-Beuve (Paris, 1875), an admirable work, not completed.

Mr. B. R. Tucker, now of New York, published a translation of Proudhon's *What is Property?* in 1876, and is slowly publishing a translation of all his main works. (See also ANARCHISM.)

PUBLIC DOMAIN (UNITED STATES).

—The total amount of lands acquired by the United States Government by treaty, conquest, cession by States, and purchase, from 1781 to 1867, is 2,889,175.91 square miles, or 1,849,072,587 acres. Of this amount 404,995.91 square miles, or 259,171,787 acres, were ceded to the Government by the States between the years 1781 and 1803. The remainder of the public domain was acquired from foreign governments at the times, and for the considerations, given in the subjoined table:

From whom bought.	Date of purchase	Number of acres.	Amount of consideration.
France.....	1803	756,961,280	\$27,267,621.98
Spain.....	1810	37,931,520	6,489,768.00
Mexico.....	1848	334,443,520	15,000,000.00
Texas.....	1850	61,892,480	16,000,000.00
Mexico.....	1853	29,142,400	10,000,000.00
Russia.....	1867	369,529,600	7,200,000.00
Totals.....		1,589,900,800	\$81,957,389.98

In estimating the total purchase of land by the Government, the Georgia cession of 1802, comprising 56,689,920 acres, and costing \$6,200,000 should be added to the above table. Including this item, our public domain has cost the National Government \$88,157,389.98, which is about 4 7-10 cents per acre.

"A Congressional ordinance, enacted on May 20, 1785, gave the Board of Treasury, or what is now the Treasury Department, the power to dispose of all public lands remaining after the land bounties granted to members of the Continental army had been satisfied. A price to the public of not less than \$1 per acre was prescribed by the ordinance. In addition to the sales made by the Board of Treasury, Congress, by special enactment, effected sales of lands for particular objects. The act of May 10, 1800, established four district offices to dispose of lands, with an officer for each, called a register. An act dated April 25, 1812, established the General Land Office as a bureau in the Treasury Department. In 1836 the General Land Office was placed under the control of the President, and the duties of the office were increased. In 1849 it was placed under the control of the Secretary of the Interior, where it has since remained."

The lands open to sale and settlement by the public are classed as agricultural, mineral, coal, desert, timber, saline, stone, and town-site lands. In addition to the conveyances of land to private individuals, lands have been set apart for occupancy by the Indian tribes, and vast tracts have been granted to States and corporations for purposes set forth in subsequent paragraphs of this article.

Up to June 30, 1892, the total cost of the public domain was \$378,002,688.14; land to the amount of 784,647,308.77 acres has been disposed of, and the receipts therefor were \$319,123,159.34. Thus, on June 30, 1892, the public

domain had cost \$58,879,528.80 more than had been realized from it.

The lands disposed of were distributed as follows :

	<i>Acres.</i>	
Lands conveyed to individuals under the various laws requiring settlement and improvement.....	482,672,984.27	
<i>Grants to States.</i>		
Education purposes.....	81,294,658.82	
Saline lands.....	560,764.93	
Swamp lands.....	59,520,313.49	
Wagon roads.....	1,790,889.54	
Canals.....	4,133,158.06	
Internal improvements.....	7,858,592.70	
<i>Grants to Corporations.</i>		
Railroad lands, certified and patented (part of the lands embraced in this total was granted to States, and by them granted to railroad corporations).....	56,483,894.37	
<i>Miscellaneous Grants.</i>		
Indian allotments and special grants; largely the former.....	90,332,142.59	
Total grants.....	301,974,324.50	301,974,324.50
Total disposals.....	784,647,308.77	

From the 1,064,425,278.23 acres remaining in the public domain on July 1, 1892, these deductions should be made: Selections under railroad grants awaiting examination, 28,846,961.60 acres; wagon-road selections pending, 313,406.37 acres; State selections for educational purposes pending, 1,093,168.52 acres; and railroad selections approved by the General Land Office, but awaiting the approval of the Secretary of the Interior, 1,117,591.88 acres; total, 31,371,128.37 acres; leaving 1,033,054,149.86 acres available to settlers. Some of these pending claims may be rejected by the General Land Offices, and if they are the lands called for will be restored to the public domain. Of the land yet open to settlers, it is estimated that there are 10,000,000 acres in arable lands; 70,000,000 acres in coal and mineral lands, and that a large portion of the remaining area is made up of desert lands that will have no value until a greater density of population, years hence, renders the occupancy of them necessary.

Since June 30, 1880, the Government has disposed of 209,279,805.02 acres. If the disposals continue at the same rate, all the lands possessing any real or prospective value, including portions of Alaska, will be private property within 50 years.

In the table giving disposals of land up to June 30, 1892, 482,672,984.27 acres are given as having been conveyed to persons under the laws requiring settlement and improvement. But the reader should hesitate before assuming that all this amount of land was conveyed to *bona fide* settlers. An inquiry into the net results of the laws named will dispel any such pleasing supposition.

The Preemption Act of 1841, which remained in force until March 3, 1891, required settlement, inhabitation, and improvement of the land desired for not less than six months, and then the payment of the minimum price, generally \$1.25 per acre, for it. If the land was subject to "private cash entry," the settler was entitled to 12 months credit; if it was "unoffered"

land, he was entitled to 33 months credit. No more than 160, nor less than 40 acres, were subject to entry under this law. The law required that the preemptor be a citizen of the United States, or have declared an intention to become such; the head of a family, a widow, or a single man over 21; and not the proprietor of 320 acres anywhere in the United States. The law was evaded by making false affidavits as to the quality of the land, and as to inhabitation and improvement. The objects sought by evasion of the law were (1) to obtain title to large quantities of land; (2) to obtain valuable coal or iron lands at less than the Government price; (3) to obtain valuable timber lands; (4) to control the ranges in grazing districts by obtaining title to valleys, or to shores of streams and water-courses, and (5) to control the land under color of claim of record, and hold the same for sale or speculation. The report of the Public Land Commission, appointed by the Forty-sixth Congress, contains (on p. 540) this assertion:

"It is stated by land officers that more than one-half of all the entries under the Preemption Act are fraudulent."

The report of the Commission of the General Land Office for 1885 states that the fraudulent entries under this law range, in some States, from 75 to 90 per cent. Vast quantities of land have, under the preemption system, passed into the hands of speculators, capitalists, and "bonanza" farmers; contiguous tracts having been obtained by collusive entries. Mythical names have been signed to the entry papers, and in some cases the names of an entire family, including infants, have been utilized. Inhabitants of near-by towns, and even temporary sojourners, are known to have selected lands, and after erecting unsubstantial houses, plowing a few furrows, and paying occasional visits to the claims, have demanded and secured their patents. Very often the preemptor did not take any steps to secure his final papers, but held the claim until he found some one to pay him a good price for relinquishment of it. The act of March 3, 1891, repealed this law, but all claims initiated before the passage of the act were dealt with as provided by the old law.

The original Homestead Act (7. 2.) has been amended several times. It gives, for a nominal fee, to the head of a family, a widow, or a single man over the age of 21 years, a citizen of the United States, or one who has declared an intention to become such, the right to locate upon 160 acres of unoccupied public land, to live upon, and cultivate the same for five years, and upon proof of compliance with the law, to receive a patent therefor, free of cost or charge for the land. Full citizenship is requisite to obtain final title. The act of March 3, 1891, prohibits an owner of 160 acres in any part of the United States from acquiring any right under the Homestead Law, and requires proof of residence and cultivation for 14 months after entry before a homestead can be "commuted" or purchased at the regular rate of \$1.25 or \$2.50 per acre. Any settler who, at the end of three years' residence on his homestead, shall have had under cultivation for two years one acre of timber, in a thrifty condition, for every 160 acres of the tract, may, upon proving the fact, receive a patent for the homestead. Only non-mineral lands are subject to entry under the preemption and homestead laws, and prices have ranged from 12½ cents to \$2.50 per acre. Fraudulent entries have prevailed under this law for purposes, and by means, similar to those under the Preemption Law. Persons have alleged settlement prior to the date of entry, and at the time, or soon after, have given 'final proof,' and in this way have secured title earlier than in ordinary homestead entries, and in some instances, before the discovery of the fraud. In many cases investigated, it has been shown conclusively that no improvement was ever made, the premises showing no evidence of residence or cultivation. William A. J. Sparks, the commissioner of the General Land Office for the years 1886-87, estimated, in his report for 1885, that 40 per cent. of the entries under the Homestead Law are fraudulent, and he ascribed most of the frauds to laxity of official regulations.

The Timber-Culture Law was enacted in 1873, amended in 1874, and again in 1878. Under it any male or female adult, being the head of a family, a citizen of the United States, or having declared an intention to become such, may enter not less than 40 nor more than 160 acres of non-mineral or unreserved land. One-fourth part of the tract must be devoted to

The Pre-emption Act.

The Homestead Act.

timber-growing for eight years; after eight years, on proof of the facts, a patent for the land will be issued. Residence on the land is not required. The act of March 3, 1891, repealed this law so far as future entries are concerned; and it allows the commutation of a timber-culture claim after four years' compliance with the law, at \$1.25 per acre, to any claimant who is a bona-fide resident of the State or Territory in which the land is located. The Public Land Commission of the Forty-sixth Congress states: "Thus far the act has been used mostly by speculators intent on acquiring large tracts of public lands."

The Timber-Culture Law.

March 3, 1877, Congress enacted the "Desert-Land Act," which applies to California, Oregon, Nevada, Washington, Idaho, Montana, Wyoming, the Dakotas, and the Territories of Utah, Arizona, and New Mexico. The act of March 3, 1891, limits the amount of land obtainable by one person under the Desert-Land Law to 320 acres; requires that at the time of filing the application a plan of the proposed irrigation must be filed, and it calls for proof of an expenditure in irrigation improvements of \$3 per acre for the whole tract within the three years. Uses of the law have chiefly been to secure possession of lands by the mere formalities of entry, and largely of lands that are well watered or cultivable without irrigation. There is abundant evidence that stock-raising companies have freely availed themselves of the opportunity afforded them by this law to secure good grazing grounds for three years, at the total cost of 25 cents per acre. Possession of lands that are irreclaimable, and are valuable only for timber, has been obtained by persons under this law. The limitation of quantity has been evaded by collusive entries and subsequent assignments to the person or persons instigating the fraud.

An act authorizing the sale of timber land unfit for cultivation in California, Oregon, Nevada, and Washington, at \$2.50 per acre, was passed by Congress on June 3, 1878. The benefits of this law are open only to citizens or those who have declared their intention to become citizens, and the quantity of land is limited to 160 acres for any one person or association of persons. Proof of the non-mineral and non-agricultural character of the land desired must be shown. This act also provides for the sale of lands that are valuable chiefly for stone, in the same quantity and on the same terms as timber lands. It also provides that all bona-fide residents of Colorado, Nevada, Wyoming, the Dakotas, Idaho, Montana, and the Territories of New Mexico and Arizona, and all mineral districts of the United States, shall be permitted to fell and remove the timber on the lands that are subject to mineral entry only. This law has operated to place vast and valuable forests in the possession of wealthy corporations or individual operators, and, sometimes, foreign syndicates. The report of the commissioner of the General Land Office for 1887 tells of a Scottish syndicate that fraudulently obtained possession of 64,000 acres (valued at \$6,400,000) of the most valuable timber belt in California. The wholesale destruction of forests allowed by this act has served, in some sections of the country, to induce sudden and disastrous floods in streams that have their rise along the watersheds denuded of their timber, and in other sections the destruction of the forests has decreased the rainfall to such an extent as to render extensive tracts of land almost worthless for agricultural purposes. The act of June 3, 1878, on its face, condemns itself, and the reader will marvel at the public indifference that permitted it to become a law. Why, as a plain business proposition, the Government should sell valuable timber lands that are worth at least \$25 to \$100 per acre, for \$2.50 per acre, no man living will ever be able to explain.

The Desert-Land Act.

Lands containing coal are subject to private entry and sale, the price being \$10 per acre where the land is situated more than 15 miles from any completed railroad, and \$20 per acre where the land is within 15 miles of such road. An individual may purchase 160 acres; an association of not less than four persons, 320 acres. The individual purchaser and each of the persons comprising an association must be 21 years of age and a citizen of the United States, or have declared his intention to become a citizen. Owner-

ship of other land does not disqualify one from purchasing coal lands. Any association of not less than four qualified persons, who have expended not less than \$5000 in working and improving any coal-mine or mines, may enter 640 acres, including such mining improvements. This law has been defeated by fraudulent entries under the homestead and pre-emption laws of coal lands as agricultural lands, and the uniform failure of the land laws to provide for a proper inspection of claims by government agents. In Washington, Wyoming, Colorado, and doubtless other States, corporations have secured possession of immense coal-fields by falsely representing them to be agricultural lands, and by having them entered as such in the names of mythical personages. The existing law relative to public lands that are valuable principally for minerals provides for sales of "lands bearing gold, silver, iron, cinnabar, lead, tin, copper, or other valuable deposits" to citizens of the United States, or those who have declared their intention to become such, at \$2.50 to \$5 per acre or fraction of an acre. The maximum of a quartz lode or vein claim is 1500 by 600 feet, and the minimum 1500 by 50 feet, or 20.66 acres maximum and 1.72 acres minimum. A placer claim made by an individual must not exceed 20 acres, and must be paid for at the rate of \$2.50 for each acre or fraction of an acre. Between July 9, 1870, and May 10, 1872, a placer claim to the amount of 160 acres could be taken by any one individual. Owners of mining claims who run tunnels are entitled to the possessory right of all "blind lodes" discovered and intersected by such tunnels. The prices asked for these lands barely cover the expense of making out titles or patents. But the purchaser may reap millions of dollars from the land. The 20 acres of lode mineral land embraced in the Consolidated Virginia and California mines have yielded nearly \$100,000,000. It will be observed that this law does not limit the number of lode claims one person may obtain title to, nor does it require an affidavit that a claim is in good faith and for himself. As may be expected speculators, by using "dummy" names in profusion, acquire large tracts of mineral land, which they in many cases dispose of at a good profit to foreign capitalists. A law for which no good reasons have been assigned is the act of March 3, 1883, by which all the public lands in Alabama were exempted from the operations of the mineral-land laws and thrown open to purchase at public sale, in unlimited quantities, at \$1.25 per acre. These lands now embrace over 800,000 acres, and they contain valuable minerals, such as iron and coal, and much valuable timber. Both home and foreign capitalists have taken advantage of this act, and have secured large tracts of the best land in Alabama at a ridiculously low price.

Another law that seems to have been enacted for the benefit, and possibly by the instigation of speculators and capitalists, is the act of June 22, 1876, by which all the public lands in the States of Alabama, Arkansas, Florida, Louisiana, and Mississippi were thrown open to public sale, in unlimited quantities, at \$1.25 per acre. All the advertised lands that are not taken at the time of the public sale may be obtained thereafter at private sale at \$1.25 per acre. The results of former public offerings of these lands are such that any person, citizen or alien, can at this moment buy 1,000,000 or more acres of timber, mineral, and agricultural lands in the States named. On June 30, 1892, the vacant public lands in these States amounted to 30,856,783 acres.

The Timber-Land Law.

Of the total disposals of land to June 30, 1892, 482-672,984.27 acres have been given as being disposed of under the laws requiring settlement and improvement. It is probable that less than one-half of this amount of land was conveyed to bona-fide settlers. This estimate is justified, not only by the abuses described, but by the general failure of the land laws to provide for the limitation of the amount of land acquirable by any one person. Under the settlement and improvement laws, as they stood prior to March 3, 1891, any person above the age of 21 years, whether an actual or an intended citizen of the United States, could legally acquire 1120 acres of land, as shown in the appended table:

Under the pre-emption act..... 160
Under the homestead act..... 160
Under the timber-culture act..... 160
Under the desert-land act..... 640

ship of other land does not disqualify one from purchasing coal lands. Any association of not less than four qualified persons, who have expended not less than \$5000 in working and improving any coal-mine or mines, may enter 640 acres, including such mining improvements. This law has been defeated by fraudulent entries under the homestead and pre-emption laws of coal lands as agricultural lands, and the uniform failure of the land laws to provide for a proper inspection of claims by government agents. In Washington, Wyoming, Colorado, and doubtless other States, corporations have secured possession of immense coal-fields by falsely representing them to be agricultural lands, and by having them entered as such in the names of mythical personages. The existing law relative to public lands that are valuable principally for minerals provides for sales of "lands bearing gold, silver, iron, cinnabar, lead, tin, copper, or other valuable deposits" to citizens of the United States, or those who have declared their intention to become such, at \$2.50 to \$5 per acre or fraction of an acre. The maximum of a quartz lode or vein claim is 1500 by 600 feet, and the minimum 1500 by 50 feet, or 20.66 acres maximum and 1.72 acres minimum. A placer claim made by an individual must not exceed 20 acres, and must be paid for at the rate of \$2.50 for each acre or fraction of an acre. Between July 9, 1870, and May 10, 1872, a placer claim to the amount of 160 acres could be taken by any one individual. Owners of mining claims who run tunnels are entitled to the possessory right of all "blind lodes" discovered and intersected by such tunnels. The prices asked for these lands barely cover the expense of making out titles or patents. But the purchaser may reap millions of dollars from the land. The 20 acres of lode mineral land embraced in the Consolidated Virginia and California mines have yielded nearly \$100,000,000. It will be observed that this law does not limit the number of lode claims one person may obtain title to, nor does it require an affidavit that a claim is in good faith and for himself. As may be expected speculators, by using "dummy" names in profusion, acquire large tracts of mineral land, which they in many cases dispose of at a good profit to foreign capitalists. A law for which no good reasons have been assigned is the act of March 3, 1883, by which all the public lands in Alabama were exempted from the operations of the mineral-land laws and thrown open to purchase at public sale, in unlimited quantities, at \$1.25 per acre. These lands now embrace over 800,000 acres, and they contain valuable minerals, such as iron and coal, and much valuable timber. Both home and foreign capitalists have taken advantage of this act, and have secured large tracts of the best land in Alabama at a ridiculously low price.

Another law that seems to have been enacted for the benefit, and possibly by the instigation of speculators and capitalists, is the act of June 22, 1876, by which all the public lands in the States of Alabama, Arkansas, Florida, Louisiana, and Mississippi were thrown open to public sale, in unlimited quantities, at \$1.25 per acre. All the advertised lands that are not taken at the time of the public sale may be obtained thereafter at private sale at \$1.25 per acre. The results of former public offerings of these lands are such that any person, citizen or alien, can at this moment buy 1,000,000 or more acres of timber, mineral, and agricultural lands in the States named. On June 30, 1892, the vacant public lands in these States amounted to 30,856,783 acres.

Of the total disposals of land to June 30, 1892, 482-672,984.27 acres have been given as being disposed of under the laws requiring settlement and improvement. It is probable that less than one-half of this amount of land was conveyed to bona-fide settlers. This estimate is justified, not only by the abuses described, but by the general failure of the land laws to provide for the limitation of the amount of land acquirable by any one person. Under the settlement and improvement laws, as they stood prior to March 3, 1891, any person above the age of 21 years, whether an actual or an intended citizen of the United States, could legally acquire 1120 acres of land, as shown in the appended table:

Under the pre-emption act..... 160
Under the homestead act..... 160
Under the timber-culture act..... 160
Under the desert-land act..... 640

The Mineral-Land Law.

No Limitation of Ownership.

In addition to the 1120 acres the individual citizen, or intended citizen, could purchase 1,000,000 or more acres in the Southern States, 160 acres of timber land, 160 acres of coal land, and at least 40 acres of mineral lands.

Under the laws as they stand now, a citizen of the United States can legally acquire land as follows:

	<i>Acres.</i>
Under the homestead act.....	160
Under the desert-land law.....	320
Total.....	480

One who has declared his intention to become a citizen can legally acquire 320 acres under the desert-land law; and either citizen or intended citizen can still purchase over 1,000,000 acres, as is shown in a paragraph above.

An adult foreigner, immediately upon landing in the United States, and declaring an intention to become a citizen of our country, can file a claim for public lands. The report of the Public Land Commission of the Forty-sixth Congress says:

"It is not a rash estimate to say that almost one-third of our public lands now go to persons who are not citizens of the United States, and, under many laws, need not be to perfect title."

When the report was written (in 1883), 620,000,000 acres of our public lands had been disposed of.

The custom of granting lands to the States for educational purposes and such internal improvements as canals, wagon-roads, and railroads, was inaugurated by Congress in 1802. It has proved to be a fertile field for the schemes of speculators and land-grabbers. Having become impatient of the comparatively light

The Land Grants.

restrictions and prices imposed by the various settlement and improvement laws, corporations and speculators have operated through the State governments to secure grants or gifts of land, ostensibly for State purposes.

Most of the claims for land presented by the State governments have been acceded to by Congress, and there is reason for believing that much of the land so obtained by the States has been sold at nominal prices, and, presumably, to the persons instigating the claims. All the forms of granting land to the States are open to suspicion; but only in regard to the grants of swamp lands, grants for educational purposes, and for railroads, do the Government reports furnish positive assertions and indubitable facts.

The avowed object of granting all the swamp lands within the borders of the State to the State government, is to secure their reclamation or drainage for the purposes of agriculture and commerce. How genuine many of the State claims for lands of this character are may be surmised from the fact that, altho the total area of the swamp lands in the States amounted in 1848, according to the Commissioner of the General Land Office, to only 20,785,337.75 acres, the claims for swamp lands aggregated, on June 30, 1852, 80,271,541.13 acres. Up to June 30, 1852, Congress had approved these claims to the extent of 59,520,313.49 acres, and the General Land Office had issued patents for 57,793,549.93 acres. On March 2, 1855, and March 3, 1857, Congress provided indemnity, in cash to the States, for swamp and overflowed lands disposed of by the United States between the date of the first grant (March 2, 1849), and March 3, 1857, and despite the fact that the sales and selections of such lands by the United States are estimated to amount to only 840,000 acres, the States, up to June 30, 1852,

The Swamp Grants.

have received in land indemnity 857,108.40 acres of good agricultural lands, and, in addition, a cash indemnity of \$1,599,365.26. The State governments have fostered fraud in connection with these grants, by appointing agents to select swamp lands and secure the indemnity, promising the agents 10, 15, and in some cases as high as 50 per cent. of such indemnity as might be recovered from Congress. To give an example of the frauds perpetrated, it may be stated that while the area of the State of Florida is 37,931,520 acres, the swamp claims of that State amounted, in 1871, to 20,259,380 acres, the selections embracing whole townships. The unscrupulous persons who have robbed the United States Government by means of these grants reached the height of their audacity a year or two ago, when they made an effort to induce Congress to allow indemnity for the lands sold by the Government between 1857 and the present date.

Prior to September 29, 1830, when Congress passed a bill forfeiting all unearned railroad grants, it was estimated that, if the roads were completed as required by the granting acts, they would receive patents for 155,504,994.59 acres.

But up to June 30, 1852, according to the General Land Office reports, the roads had earned and received patents for only 56,483,804.37 acres. Of this amount about 37,685,731.88 acres were granted to the States and were by them distributed to corporations; the remainder, 18,798,072.49 acres, being granted directly to corporations. Prior to 1861 all grants for railroad purposes were made to the States.

The Railroad Grants.

The first right of way for a railroad was granted to Florida in 1835. The grant conceded 30 feet of land on each side of the railroad line, and the use of the timber within 300 feet on either side, and 10 acres of timber at the terminus. The width of the "right of way" steadily increased in subsequent grants until, in 1850, the State of Illinois was granted alternate or even-numbered sections of land for six sections, or six miles, in width on each side of the proposed railroad and its branches. The act authorizing the last-named grant provided that the railroad company might select "indemnity lands" within 15 miles of its line for such lands within the original grant as might be occupied by settlers at the time of the definite location of the route. The act also provided for the forfeiture of the lands granted in the case of failure to construct the road within a specified time. The indemnity provision was initiated by this act. The forfeiture provision was established in 1836.

It is estimated that the average amount of land granted for every mile constructed of the land-grant railroads is 15 sections or 9600 acres, the Government reserving the even-numbered, and in some cases, the odd-numbered sections within the limits of the grants for private cash entry at not less than \$2.50 per acre. A conservative estimate places the value of the lands conveyed to the roads at \$4 per acre, or \$38,400 worth of land for every mile of road constructed. The actual practical value, to the roads, of these land subsidies, may be seen by referring to the reports regarding the cost of the Pacific railroads. The subsidized railroads have also been allowed to use the timber on the public lands to aid in the construction of the roads.

The reports of railroad construction show that 18,071 miles have been constructed under the land-grant system, and that over 100,000 miles have been built without the aid of Congressional subsidies. Many of the latter have been constructed through undeveloped country, while many of the former were not built until the settlements outside the railroad limits had grown sufficiently to make construction profitable without the public subsidies; the extensions of time granted the roads having made the delay in construction possible.

As a rule, none of the roads could legally claim lands until the line of a road was definitely located, all the land along a proposed line remaining subject to settlement and entry until the time of definite location. But the General Land Office has, according to ex-Commissioner Sparks and others, from time to time illegally withdrawn from settlement and entry lands within the granted limits, and even within the indemnity limits, and have generally denied the legal rights of settlers on the illegally withdrawn lands. Failing to have their rights recognized by the General Land Office, the settlers have been obliged to purchase from the railroad companies waivers or relinquishments of the lands occupied. But where a settler's entry on withdrawn lands has been permitted by the General Land Office, and a subsequent decision has declared the railroad claim to be superior in point of time, the companies have, under the act of June 22, 1874, reaped a double profit. They sell a relinquishment to the settler, and then select lien land for the land relinquished; the lien land generally being selected from the most valuable localities in the reserved Government sections. This act of June 22, 1874, was restricted to lands within granted limits, but it has also been applied to lands taken by settlers within indemnity limits, thus giving the company extra indemnity or three profits. These illegal withdrawals have given the companies the power to appropriate valuable timber and coal, to dominate town sites and monopolize water privileges.

The railroad companies have avoided the payment of State and county taxes on their lands by failing to take out patents until they had secured purchasers for the lands. They have held that for all purposes save taxation, the lands are railroad lands; when taxes are

called for the lands are represented to be Government property, and they are legally such until patents are issued.

In a table in the first portion of this article, 784,647,308.77 acres were given as the total amount of public land disposed of to June 30, 1892. Of this amount, it may be estimated

**Consequences
of the
Waste.**

safely that not less than 350,000,000 acres were conveyed, by means of the evasions of the land laws and the abuses of the land-grant system, into the hands of speculators and corporations. These 350,000,000 acres—enough to give every man, woman, and child of our present population five acres, or sufficient land to support life with comfort—were held, as a rule, until land values had greatly increased and then either sold to settlers or transferred to persons who made a business of renting them to settlers. The prices asked for the lands were, in many cases, beyond the immediate means of intending settlers, and, as a consequence, tenant-farming and the system of borrowing purchase money on mortgages began. All the baneful consequences of the profligate disposition of our public lands will never be revealed. (See MORTGAGES.)

WILLIAM H. KETLER.

PULLMAN is the name of the town in Illinois, owned, built up, and ruled by the Pullman Palace Car Company for its employees.

In 1880 the company bought 500 acres of land, and upon 300 acres of it built its plant, and also a hotel, arcade, churches, athletic grounds, and brick tenements suitable for the use of its employees. The town is well laid out, and has a complete sewerage and water system. It is beautified by well-kept open spaces and stretches, flower-beds, and lakes. The whole is at all times kept in neat order by the company. The main object was the establishment of a great manufacturing business upon a substantial and money-making basis. Efficient workmen were regarded as essential to its success, and it was believed that they could be secured, held in contentment, and improved as much for their own sakes as for the benefit of the company by the accommodations and surroundings that were provided.

The principal church and its parsonage are very attractive structures, but often are not occupied, because the rental required to be paid is higher than any church society is willing to pay to obtain the gospel privileges to be thereby secured. In the arcade is a tasteful library of books, carefully selected and cared for by the company. Three dollars per year is charged for its use, and only some 250 persons a year, out of from 4000 to 5000 employees and residents, have, as stated by the librarian in charge, availed themselves of its opportunities. Says the report of the commissioners appointed by the President in 1894 to investigate the Pullman strike (*q. v.*):

"It is possible that the air of business strictly maintained there, as elsewhere, and their exclusion from any part in its management, prevent more universal and grateful acceptance of its advantages by employees. Men, as a rule, even when employees, prefer independence to paternalism in such matters.

"The company provides and pays a physician and surgeon by the year to furnish to injured employees necessary treatment and drugs. It is, however, also a part of his employment to secure from the injured party a written statement as to the causes of injury, and it is his custom to urge the acceptance of any offered settlement. If suit follows, the doctor is usually a witness for the company. We have no evidence that the doctor has ever abused his confidential relation toward the injured employees; but the system is admirably conceived from a business standpoint to secure speedy settlement of claims for damages upon terms offered by the company, and to protect the company from litigation and its results.

"Prior to June, 1893, all went well and as designed; the corporation was very prosperous, paid ample and satisfactory wages, as a rule, and charged rents which caused no complaint. During this period those defects in the system which have recently come to the surface and intensified differences, such, for instance, as the refusal to permit the employees to buy land in Pullman and build homes there, caused no disturbance. . .

"If we exclude the esthetic and sanitary features at Pullman, the rents there are from 20 to 25 per cent. higher than rents in Chicago or surrounding towns for similar accommodations. The esthetic features are admired by visitors, but have little money value to employees, especially when they lack bread. The company aims to secure 6 per cent. upon the cost of its tenements, which cost includes a proportionate share for paving, sewerage, water, parks, etc. It claims now to receive less than 4 per cent. It has some brick-makers' cottages upon which, at \$8 per month, it must obtain at least 40 per cent. return upon their value. These are, however, exceptional. The company makes all repairs, and heretofore has not compelled tenants to pay for them. Under the printed leases, however, which tenants must sign, they agree to pay for *all repairs* which are either necessary (ordinary wear and damages by the elements *not* excepted) or which the company *chooses* to make.

"The company's claim that the workmen need not hire its tenements, and can live elsewhere if they choose, is not entirely tenable. The fear of losing work keeps them in Pullman as long as there are tenements unoccupied, because the company is supposed, as a matter of business, to give a preference to its tenants when work is slack. The employees, believing that a tenant at Pullman has this advantage, naturally feel some compulsion to rent at Pullman, and thus to stand well with the management. Exceptional and necessary expert workmen do not share this feeling to the same extent and so can own homes elsewhere.

"Prior to the so-called 'truck' law in Illinois, rent was deducted from the wages. Since then a check is given for the amount of the rent and another for the balance due for wages. There is nothing to prevent the payee of the check from cashing it outside of the bank, but as the bank is rent collector, it presses for the rent, and is aided in collecting it by knowledge on the part of the tenant that by arrears he may lose his job. At the time of the strike about \$70,000 of unpaid rents had accumulated. It is fair to say that this accumulation of unpaid rent was due to leniency on the part of the company toward those who could not pay the rent and support their families."

The statements thus far are from the report of the Commission. For the authorities for its statements, see the report. Mr. Pullman said in his own statement before the Commission:

"The object in building Pullman was the establishment of a great manufacturing business on the most substantial basis possible, recognizing as we did, and do now, that the working people are the most important element which enters into the successful operation of any manufacturing enterprise.

"We decided to build, in close proximity to the shops, homes for working men, of such character and surroundings as would prove so attractive as to cause the best class of mechanics to seek that place for employment in preference to others. We also desired to establish the place on such a basis as would exclude all baneful influences, believing that such a policy would result in the greatest measure of success, both from a commercial point of view, and also, what was equally important, or perhaps of greater importance, in a tendency toward continued elevation and improvement of the condition not only of the working people themselves, but of their children growing up about them.

"It was not the intention to sell workmen homes in Pullman, but to so limit the area of the town that they could buy homes, at convenient distances from the works, if they chose to do so. If any lots had been sold in Pullman, it would have permitted the introduction of the very baneful elements which it was the chief purpose to exclude from the immediate neighborhood of the shops and from the homes to be erected about them.

"The plan was to provide homes in the first place for all people who should desire to work in the shops, at reasonable rentals, with the expectation that as they became able, and should desire to do so, they would purchase lots and erect homes for themselves within convenient distances, or avail themselves of the opportunity to rent homes from other people who should build in that vicinity. As a matter of fact, at the time of the strike, 563 of the shop employees owned their homes, and 467 of that number are now employed in the shops, 560 others at the time of the strike lived outside, and in addition, an estimated number of from 200 to 300 others employed at Pullman were owners of their homes. The company neither planned nor could it exercise any municipal powers in Pullman."

Mr. Stead in his *If Christ Came to Chicago*, writes of Pullman :

"Pullman is a great achievement, of which not only Chicago but America does well to be proud.

"It was not a philanthropic, but a business experiment, and none the worse on that account. The great principle of *quid pro quo* was carried out with undeviating regularity. If every resident of Pullman had gas laid to his house, he was compelled to pay for it at the rate of \$2.25 a thousand feet, although the cost of its manufacture to the Pullman Company was only 33 cents a thousand feet. Ample water supply was given, with good pressure, but of this necessary of life the Pullman Company was able to extract a handsome profit. The city of Chicago supplied the corporation with water at four cents a thousand gallons, which was retailed to the Pullmanites at 10 cents per thousand, making a profit large enough to enable the corporation to have all the water it wanted for its works for nothing. Thus did the business instinct of Mr. Pullman enable his right hand to wash his left, and thereby created at the very threshold of Chicago are object lessons as to the commercial profits of municipal socialism. But between municipal socialism, representing the cooperative effort of a whole community voluntarily combining for the purpose of making the most of all monopolies of service, and the autocratic exploiting of a whole population of a city, such as is to be found in Pullman, there is a wide gulf fixed.

"As a resident in the model town wrote me, Pullman was all very well as an employer, but to live and breathe and have one's being in Pullman, is a little bit too much. The residents in the city, he continued, 'paid rent to the Pullman Company, they bought gas of the Pullman Company, they walked on streets owned in fee simple by the Pullman Company, they paid water-tax to the Pullman Company. Indeed, even when they bought gingham for their wives or sugar for their tables at the arcade or the market-house, it seemed dealing with the Pullman Company. They sent their children to Pullman's school, attended Pullman's church, looked at but dared not enter Pullman's hotel with its private bar, for that was the limit. Pullman did not sell them their grog. They had to go to the settlement at the railroad crossing south of them, to Kensington, called, because of its long row of saloons, 'bumtown,' and given over to disorder. There the moral and spiritual disorder of Pullman was emptied, even as the physical sewage flowed out on the Pullman farm, a few miles further south, for the Pullman Company also owned the sewerage system, and turned the waste into a fluid, forced through pipes and conducted underground to enrich the soil of a large farm. The lives of the working men were bounded on all sides by the Pullman Company; Pullman was the horizon in every direction.'

"All this provoked reaction, and a feeling of resentment sprang up in the model city against the too paternal despotism of the city-builder, and so it came to pass that the citizens by a vote annexed themselves to Chicago, of which it is now part and parcel. This was a sore blow and a great discouragement to Mr. Pullman. But no annexation can destroy his control over the town. It is still the property of the corporation of which he is the chief and controlling mind."

PULLMAN STRIKE, THE.—This strike, sometimes also called the Chicago strike because, tho it began in Pullman, it extended very widely and centered mainly in Chicago, is declared by Mr. Carroll D. Wright (*Industrial Evolution of the United States*, p. 313) to be "probably the most expensive and far-reaching labor controversy which can properly be classed among the historic controversies of this generation."

Our account of the strike is based upon the findings of the report of the Commission appointed by the President July 26, 1894, to investigate the strike.

It began May 11, 1894, and grew out of a demand of certain employees of the Pullman Company for a restoration of the wages paid during the previous year. During 1893 the wages of the employees had been considerably reduced. How much is a matter of dispute. According to the statement before the Commission of Mr. T. H. Wickes, the second vice-president of the company :

Cause of
Strike.

"The average reduction of wages between April, 1893, and April, 1894, for journeymen mechanics was 22½ per cent., and the average reduction for all other shop employes, excluding all the superintendents, foremen, and shop office force, was 11½ per cent. The average reduction for all shop employes, excluding all the superintendents, foremen, and shop-office force, was 19 per cent."

According to the finding of the Commission the cut in wages averaged 25 per cent. on an average pay for the year ending July 1, 1893, of \$613.86 for 4497 employees. At the Company's figures the reduction was a very serious one. Says the report: "Some witnesses swear that at times for the work done in two weeks the employees received in checks from four cents to one dollar over and above their rent. The company has not produced its checks in rebuttal."

The cause for the cut down assigned by the company was the depressed state of business. Said Mr. Wickes before the Commission :

"From August 1, 1893, to May 1, 1894, our net loss on accepted bids was \$52,069.03, and the net estimated loss on unaccepted bids was \$18,303.56. We had tried to get work for our employes by bidding for work the estimated shop cost of which was \$2,775,481.81, and we only got contracts for work the estimated shop cost of which is \$1,421,205.75. We had been underbid on work the estimated shop cost of which was \$1,354,276.06, notwithstanding that our bids on \$1,057,355.97 of that amount not only excluded all profit, but showed a loss, based as they were on the reduced scale of wages."

Says the Commission's report :

"Some reduction of wages in all departments was of course proper under the circumstances, but a uniform reduction as between departments so differently situated in reference to revenue as the car-building and repair departments was not relatively just and fair toward the repair-shop employes. . . .

"During all of this reduction and its attendant suffering none of the salaries of the officers, managers, or superintendents were reduced. Reductions in these would not have been so severely felt, would have shown good faith, would have relieved the harshness of the situation, and would have evinced genuine sympathy with labor in the disasters of the times. . . . While reducing wages the company made no reduction in rents. Its position is that the two matters are distinct, and that none of the reasons urged as justifying wage reduction by it as an employer can be considered by the company as a landlord.

"The company claims that it is simply legitimate

business to use its position and resources to hire in the labor market as cheaply as possible, and at the same time to keep rents up regardless of what wages are paid to its tenants or what similar tenements rent for elsewhere; to avail itself to the full extent of business depression and competition in reducing wages and to disregard these same conditions as to rents. No valid reason is assigned for this position except simply that the company had the power and the legal right to do it."

The company, as a whole, was prosperous. The Commission's report says the corporation was

"organized in 1867, with a capital of \$1,000,000. It has grown until its present paid-up capital is \$36,000,000. Its prosperity has enabled the company for over twenty years to pay 2 per cent. quarterly dividends, and, in addition, to lay up a surplus of nearly \$25,000,000 of undivided profits. From 1867 to 1871 dividends ranging from 0½ to 12 per cent. per annum were paid. For the year ending July 31, 1893, the dividends were \$2,520,000, and the wages \$7,223,719.51. For the year ending July 31, 1894, the dividends were \$2,880,000, and the wages \$4,471,701.39."

The reply of the company is that it did allow rents to accumulate in arrears, and that as to the business depression and loss it did bear

"its full share by eliminating from its estimates the use of capital and machinery, and in many cases going even below that and taking work at considerable loss, notably the 55 Long Island cars, which was the first large order of passenger cars let since the great depression, and which was sought for by practically all the leading car-builders in the country" (Statement of Mr. Pullman, Chicago *Herald*, June 26, 1894).

Of the development of the strike the Commission's report says:

"The reductions at Pullman after September, 1893, were the result of conferences among the managers; the employees for the first time knew of them when they took effect. No explanations or conferences took place until May 7 and 9 in regard thereto between the employees and the officers of the company. For the reasons stated the employees at Pullman were during the winter in a state of chronic discontent. Upon May 7 and 9 a committee of forty-six from all the departments waited upon the management and urged the restoration of wages to the basis of June, 1893. The company refused this, and offered no concession as to wages whatever, maintaining and explaining that business conditions did not justify any change. The company based its entire contention as to every department upon the facts in reference to car-building to which we have alluded, and offered to show its books and figures as to the cost and selling prices of cars. This offer, on account of the strike intervening, was not acted upon. . . . The purpose of the management was obviously to rest the whole matter upon cost, etc., in its most seriously crippled department, excluding from consideration the facts as to wages in the repair department to which we have alluded.

"The demand of the employees for the wages of June, 1893, was clearly unjustifiable. The business of May, 1894, could not pay the wages of June, 1893. Reduction was carried to excess, but the company was hardly more at fault therein than were the employees in insisting upon the wages of June, 1893. There was little discussion as to rents; the company maintaining that its rents had nothing to do with its wages, and that its revenue from its tenements was no greater than it ought to receive. . . .

"The company had a legal right to take this position, but as between man and man the demand for some rent reduction was fair and reasonable under all the circumstances. Some slight concession in this regard would probably have averted the strike, provided the promise not to discharge men who served upon the committee had been more strictly regarded.

"The next day, May 10, three of the committee were laid off by foremen for alleged lack of work, not an unusual proceeding. Those who made the promise had nothing to do with this action, and deny knowledge of it at the time. The foremen who did it are suspected by the employees of concluding that some laying off of committeemen just at that crisis would have a good effect, and would accord with the policy and general views of the company. The foremen, however, deny this. This incident was inopportune and unfortunate, to say the least, and ought to have

been more carefully guarded against by the company. An explanation of this occurrence was not asked for by the employees, as it ought to have been, before striking.

"On the evening of May 10, the local unions met and voted to strike at once. The strike occurred on May 11, and from that time until the soldiers went to Pullman, about July 4, three hundred strikers were placed about the company's property, professedly to guard it from destruction or interference. This guarding of property in strikes is, as a rule, a mere pretense. Too often the real object of guards is to prevent newcomers from taking strikers' places by persuasion, often to be followed, if ineffectual, by intimidation and violence. The Pullman Company claims this was the real object of these guards. The strikers at Pullman are entitled to be believed to the contrary in this matter, because of their conduct and forbearance after May 11. It is in evidence, and uncontradicted, that no violence or destruction of property by strikers or sympathizers took place at Pullman, and that until July 3 no extraordinary protection was had from the police or military against even anticipated disorder.

"Such dignified, manly, and conservative conduct in the midst of excitement and threatened starvation is worthy of the highest type of American citizenship, and, with like prudence in all other directions, will result in due time in the lawful and orderly redress of labor wrongs. To deny this is to forswear patriotism and to declare this Government and its people a failure.

"As soon as the strike was declared the company laid off its 600 employees who did not join the strike, and kept its shops closed until August 2. During this period the Civic Federation of Chicago, composed of eminent citizens in all kinds of business and from all grades of respectable society, called upon the company twice to urge conciliation and arbitration. The company reiterated the statement of its position and maintained that there was nothing to arbitrate; that the questions at issue were matters of fact and not proper subjects of arbitration. The Civic Federation suggested that competition should be regarded in rents as well as in wages. The company denied this. Wages and rents were to it separate matters; the principles applicable to one had no relation to the other. Later it gave the same answer to a committee of its employees. Upon June 15 and 22 it declined to receive any communication from committees of the American Railway Union; one proposition of that body being that the company select two arbitrators, the court two, and these four a fifth, to determine whether there was anything to arbitrate. The company also refused to consider any arbitration at the solicitation of the common council of Chicago, and repeated its stereotyped answer that there was nothing to arbitrate when appealed to by Mayor Pingree of Detroit, himself a large manufacturer, whom Mayor Hopkins accompanied to Pullman. At that interview Mayor Pingree claimed to have telegrams from the mayors of over fifty of the largest cities, urging that there should be arbitration."

This leads us, however, to consider the relation of the strikers at Pullman to the American Railway Union and the general railway strike that resulted.

THE AMERICAN RAILWAY UNION (*q. v.*).

This is an association of railroad employees, organized at Chicago on the 20th of June, 1893, for the purpose of including all railway employees born of white parents in one great brotherhood. Under the leadership of Mr. Eugene V. Debs it had grown very strong, particularly by winning a strike on the Great Northern. In March, 1894, the Pullman employees voted to join the American Railway Union. The Commission report says this was not wise, but adds:

"It is undoubtedly true that the officers and directors of the American Railway Union did not want a strike at Pullman, and that they advised against it, but the exaggerated idea of the power of the union, which induced the workmen at Pullman to join the order, led to their striking against this advice. Having struck, the union could do nothing less, upon the theory at its base, than support them."

There was, however, to say the least, some excuse for the A. R. U. to secure the Pullman men. The railways around Chicago were banded together. Wages were being systematically reduced. If all railroad employers were to band together, it seemed necessary for all railway employees to band together. To the Pullman employees, to join the A. R. U. seemed their one chance of victory. Alone they were helpless and hopeless. Wages were being steadily reduced, below the level of existence. Those who criticise the general strike must remember that it was a battle for life, and the one hope of success. A mere local strike was absolutely without hope, and therefore more foolish than a general strike. The General Managers' Association, representing 24 roads centering or terminating in Chicago, was organized in 1886, long before the American Railway Union.

Beginning its "active life" in 1886, its main business was to determine a common policy toward the public as to freight rates, etc., but it dealt incidentally with wages.

Strengthened thus by mutual aid, various roads made reductions of wages here and there.

Of this association the Commission says :

"The association is an illustration of the extent and shrewdly devised plans of corporations to overreach their limitations and to usurp indirectly powers and rights not contemplated in their charters and not obtainable from the people or their legislators. An extension of this association, as above suggested, and the proposed legalization of 'pooling' would result in an aggregation of power and capital dangerous to the people and their liberties as well as to employees and their rights. The question would then certainly arise as to which shall control, the Government or the railroads, and the end would inevitably be Government ownership. Unless ready for that result and all that it implies, the Government must restrain corporations within the law, and prevent them from forming unlawful and dangerous combinations. At least, so long as railroads are thus permitted to combine to fix wages and for their joint protection, it would be rank injustice to deny the right of all labor upon railroads to unite for similar purposes.

"It should be noted that until the railroads set the example a general union of railroad employees was never attempted. The unions had not gone beyond enlisting the men upon different systems in separate trade organizations. These neutralize and check each other to some extent and have no such scope or capacity for good or evil as is possible under the universal combination idea inaugurated by the railroads and followed by the American Railway Union. The refusal of the General Managers' Association to recognize and deal with such a combination of labor as the American Railway Union seems arrogant and absurd when we consider its standing before the law, its assumptions, and its past and obviously contemplated future action."

Thus, to say the least, there was some excuse for the railroad employees of the country banding together. It was not a question of Pullman alone. The strike affected the interests of every railroad man in the country. Without the general resistance they made, wages everywhere, under the depressed condition of business, would have been lowered much more than they were.

"Until June, 1894, the association dealt incidentally and infrequently with wages. There were few railroad controversies as to wages during its active life, dating from January 20, 1892. Hence its possibilities as a strike fighter and wage arbiter lay rather dormant. The following are instances of its action as to wage questions. Its roads fixed a 'Chicago

scale' for switchmen, covering all lines at Chicago. In March, 1893, the switchmen demanded more pay from each road. The association concluded that they were paid enough—if anything, too much. The roads so informed the men. The Switchmen's Mutual Aid Association of North America wrote to Mr. St. John, as chairman, acquiescing. He, as chairman of the General Managers' Association, concluded his reply as follows:

"The association approves the course taken by your body and desires to deal fairly with all employees, and believes that our switchmen are receiving due consideration."

"This seems to show that employees upon association roads are treated as under subjection to the General Managers' Association. Mr. St. John, the president of the association, testifies as follows:

"The result of this declaration on the part of the various companies directly to their own committees was a threat on the part of some that a strike would occur, and in times of trouble of that kind, or anticipated trouble, it would be the most natural thing in the world for the association, or any line member of it, to arrange to protect the interests of the company he represented. He could not do otherwise. Arrangements were made by which agencies were established and men employed to come to Chicago in case of necessity."

"This association likewise prepared for its use elaborate schedules of the wages paid upon the entire lines of its 24 members. The proposed object of these schedules was to let each road know what other roads paid. Finding that the men upon some lines urged increase to correspond with wages paid elsewhere, a committee of the association prepared and presented a uniform schedule for all membership roads. It was deemed wise not to act upon the report. It was distributed to members in November, 1893. This distribution alone enabled the report to be used with efficiency as an 'equalizer.' As the result, during 1893—it being then well understood that as to wages, etc., it was an *incident* of the General Managers' Association to 'assist' each road in case of trouble over such matters, one form of assistance being for the association to secure men enough through its agencies to take the places of all strikers—reductions were here and there made on the different roads, the tendency and effort apparently being to equalize the pay on all lines."

"It is admitted that the action of the association has great weight with outside lines, and thus tends to establish one uniform scale throughout the country."

The Pullman Car Company, however, refused to recognize the A. R. U. Of the result the Commission's report says :

"Between June 9 and June 26 a regular convention of the American Railway Union was held with open doors at Chicago, representing 465 local unions and about 150,000 members, as claimed. The Pullman matter was publicly discussed at these meetings before and after its committees above mentioned reported their interviews with the Pullman Company. On June 21 the delegates, under instructions from their local unions, unanimously voted that the members of the union should stop handling Pullman cars on June 26 unless the Pullman Company would consent to arbitration. On June 26 the boycott and strike began. The strike on the part of the railroad employees was a sympathetic one. No grievances against the railroads had been presented by their employees, nor did the American Railway Union declare any such grievances to be any cause whatever of the strike. To simply boycott Pullman cars would have been an incongruous step for the remedy of complaints of railroad employees. Throughout the strike the strike was simply over handling Pullman cars, the men being ready to do their duty otherwise. . . .

"After June 26 the officers and agents of the union managed and urged on the strike at every available point upon the railroads centering at Chicago, until it reached proportions far in excess of their original anticipations, and led to disorders beyond even their control. Urgent solicitations and appeals to strike and to stand firm continued in the many public meetings held each day in and about Chicago, and appear in the telegrams sent about the country. . . .

"According to the testimony, the railroads lost, in

**General
Managers'
Association.**

**The General
Strike.**

property destroyed, hire of United States deputy marshals, and other incidental expenses, at least \$685,308. The loss of earnings of these roads is estimated at \$4,672,916. Some 3100 employees at Pullman lost in wages, as estimated, at least \$350,000. About 100,000 employees upon the 24 railroads centering at Chicago, all of which were more or less involved in the strike, lost in wages, as estimated, at least \$1,899,143. Many of these employees are still adrift and losing wages.

"Beyond these amounts very great losses, widely distributed, were incidentally suffered throughout the country. The suspension of transportation at Chicago paralyzed a vast distributive center, and imposed many hardships and much loss upon the great number of people whose manufacturing and business operations, employment, travel, and necessary supplies depend upon and demand regular transportation service to, from, and through Chicago.

"During the strike the fatalities, arrests, indictments, and dismissal of charges for strike offenses in Chicago and vicinity were as follows:

Number shot and fatally wounded.....	12
Number arrested by the police.....	515
Number arrested under United States statutes, and against whom indictments were found'....	71
Number arrested, against whom indictments were not found.....	119

"The arrests made by the police were for murder, arson, burglary, assault, intimidation, riot, inciting to riot, and lesser crimes."

Bradstreet's estimates the losses to the country at large to be about \$80,000,000. The city police, the county sheriffs, the State militia, United States deputy marshals, and regulars from the United States Army were all brought into the controversy. The United States troops were sent to Chicago to protect Federal property and to prevent destruction in the carrying of the mails, to prevent interference with interstate commerce, and to enforce the decrees and mandates of the Federal courts. They took no part in any attempt to suppress the strike, nor could they, as such matters belong to the city and State authorities. The police of the city were used to suppress riots and protect the property of citizens, and the State militia was called in for the same service. The total of these forces employed during the continuance of the strike was 14,186. It was claimed by some that the calling out of the Federal troops was unnecessary and an invasion of State rights; they being called out simply to please the corporations and intimidate the strikers. Says the Commission's report:

"Some railroads charged the police with inefficiency and with failing to discharge their duties through sympathy with strikers. These charges have not been proved. The Mayor directed suspension and discharge for any such cause, and some suspensions occurred on charges; but investigation disclosed no evidence to sustain them. The disorders at Blue Island were outside the city of Chicago. Appropriate orders for the police to cooperate with the troops were issued. That policemen sympathized with strikers rather than with the corporations cannot be doubted, nor would it be surprising to find the same sentiment rife among the military. These forces are largely recruited from the laboring classes. Indeed, the danger is growing that in strike wars between corporations and employees military duty will ultimately have to be done by others than volunteers from labor ranks.

"The military and police confined themselves to their duty of arresting criminals, dispersing mobs, and guarding property. United States deputy marshals, to the number of 3600, were selected by and appointed at request of the General Managers' Association, and of its railroads. They were armed and paid by the railroads, and acted in the double capacity of railroad employees and United States officers. While operating the railroads they assumed and exercised unrestricted United States authority when so

ordered by their employers, or whenever they regarded it as necessary. They were not under the direct control of any Government official while exercising authority. This is placing officers of the Government under control of a combination of railroads. It is a bad precedent, that might well lead to serious consequences."

Another element that entered into the matter was the issue of injunctions (*q. v.*). Says the report:

"On July 7 the principal officers of the American Railway Union were indicted, arrested, and held under \$10,000 bail. Upon July 13 they were attached for contempt of the United States Court in disobeying an injunction issued on July 2, and served on the 3d and 4th, enjoining them, among other things, from compelling, or inducing by threats, intimidation, persuasion, force, or violence, railroad employees to refuse or fail to perform their duties. It is seriously questioned, and with much force, whether courts have jurisdiction to enjoin citizens from 'persuading' each other in industrial or other matters of common interest. However, it is generally recognized among good citizens that a mandate of a court is to be obeyed until it is modified and corrected by the court that issued it."

As a result, Debs and his comrades were convicted of contempt of court, and, without jury trial, imprisoned (see DEBS); the friends of the railroads believing that it "served the strikers right"; others believing it a dastardly and dangerous attack on the right of every man to trial before jury.

Says the report :

"There is no evidence before the Commission that the officers of the American Railway Union at any time participated in or advised intimidation, violence, or destruction of property. They knew, and fully appreciated that, as soon as mobs ruled, the organized forces of society would crush the mobs, and all responsible for them in the remotest degree, and that this meant defeat. The attacks upon corporations and monopolies by the leaders in their speeches are similar to those to be found in the magazines and industrial works of the day.

"Much stress has been laid upon the following dispatch, which Mr. Debs denies sending. It went, however, from the headquarters of the union, and that body is responsible for whatever it means:

"CHICAGO, July 2, 1894.

"TO COURTHHEAD, *South Butte, Mont.*
 "The G. M. are weakening. If strike not settled in 48 hours, complete paralysis will follow. Potatoes and ice out of sight. Save your money and buy a gun."
 "E. V. DEBS."

"The union insists that a young clerk named Benedict sent this dispatch to a friend; that the expression 'buy a gun' was one used between them, and had no reference to the strike. Nothing like this is found elsewhere among the dispatches before the Commission."

The Commission, however, finds that some of the strikers were guilty of violence. The report says :

"The strikers' experience and training were to be seen in the spiking and misplacing of switches; removing rails; crippling of interlocking systems; the detaching, side-tracking, and derailing of cars and engines; placing of coupling-pins in engine machinery; blocking tracks with cars, and attempts to detach and run in mail cars. The Commission is of opinion that offenses of this character, as well as considerable threatening and intimidation of those taking strikers' places, were committed, or instigated, by strikers.

"The mobs that took possession of railroad yards, tracks, and crossings after July 3, and that stoned, tipped over, burned, and destroyed cars, and stole their contents, were, by general concurrence in the testimony, composed generally of hoodlums, women,

a low class of foreigners, and recruits from the criminal classes. Few strikers were recognized or arrested in these mobs, which were without leadership, and seemed simply bent upon plunder and destruction. They gathered wherever opportunity offered for their dastardly work, and, as a rule, broke and melted away when force faced them. In the view that this railroad strike was wrong; that such mobs are well known to be incidental to strikes, and are thereby given an excuse and incentive to gather and to commit crime, the responsibility rests largely with the American Railway Union; otherwise that association, its leaders, and a very large majority of the railroad men on strike are not shown to have had any connection therewith. . . .

"July 13, and for some days previous, the strikers had been virtually beaten. The action of the courts deprived the American Railway Union of leadership; enabled the General Managers' Association to disintegrate its forces, and to make inroads into its ranks. The mobs had worn out their fury, or had succumbed to the combined forces of the police, the United States troops and marshals, and the State militia. The railroads were gradually repairing damages, and resuming traffic with the aid of new men, and with some of those strikers who had not been offensively active, or whose action was laid to intimidation or fear. At this juncture the refusal of the General Managers' Association to treat with the American Railway Union was certainly not conciliatory; it was not unnatural, however, because the association charged the American Railway Union with having inaugurated an unjustifiable strike; laid at its door the responsibility for all the disorder and destruction that had occurred, and, as the victor in the fight, desired that the lesson taught to labor by its defeat should be well learned.

"The policy of both the Pullman Company and the Railway Managers' Association, in reference to applications to arbitrate, closed the door to all attempts at conciliation and settlement of differences. The Commission is impressed with the belief, by the evidence, and by the attendant circumstances, as disclosed, that a different policy would have prevented the loss of life and great loss of property and wages occasioned by the strike." The End.

July 26, 1894, the President appointed a commission consisting of Carroll D. Wright, John D. Keenan of New York, and Nicholas E. Worthington of Illinois, who heard evidence and testimony as to the causes, facts, and lessons of the strike. The report so favored the strikers that it was described in *Harper's Weekly*, November 24, 1894, as "Revolutionary Statesmanship." As a result a bill for arbitration in railway strikes was laid before Congress, for an account of which see STRIKES.

References: *Report on the Chicago Strike of June and July, 1894*, by the United States Strike Commission, 1895; *The Pullman Company's Statement* (1894). Both of these, and an analysis by Professor W. J. Ashley of Harvard, with a complete bibliography of the strike, were collected and published by the Church Social Union in 1895.

(See also STRIKES; RAILROADS; INJUNCTIONS; LABOR LEGISLATION, etc.)

QUELCH, HENRY, was born at Hungerford, Berkshire, in 1858. He became a blacksmith, but in 1872 came to London, and soon interested himself in social reform. In 1881 he joined the Social Democratic Federation (almost from its start), and in 1884 commenced writing for its organ, *Justice*, since 1892 giving it all his time, and becoming its responsible editor. In 1889 he was elected secretary of the Southside Labor Protection League. He has been sent to three trades-union congresses and international socialist congresses, at Roubaix (1887), Brussels (1891), and Zurich 1893. He has been several times arrested for socialist utterances, but has been acquitted.

QUESNAY, FRANÇOIS, was born at Mérey, France, in 1694. Studying medicine at Paris, he became first physician to Louis XV., but was even more famous as an economic thinker, and one of the principal founders of the school of the physiocrats (*q. v.*) and coiner of the term *political economy*. He died at Versailles in 1774. Dr. Ingram says of Quesnay in his *History of Political Economy*:

"The publications in which Quesnay expounded his system were the following: Two articles, on *Ferriers* and on *Grains*, in the *Encyclopédie* of Diderot and D'Alembert (1756, 1757); a discourse on the law of

nature in the *Physiocratie* of Dupont de Nemours (1768); *Maximes Générales de Gouvernement Economique d'un Royaume Agricole* (1758), and the simultaneously published *Tableau Economique avec son Explication, ou Extrait des Economies Royales de Sully* (with the celebrated motto, 'pauvres paysans, pauvre royaume; pauvre royaume, pauvre roi'); *Dialogue sur le Commerce et les Travaux des Artisans*; and other minor pieces. The *Tableau Economique*, tho on account of its dryness and abstract form it met with little general favor, may be considered the principal manifesto of the school. It was regarded by the followers of Quesnay as entitled to a place among the foremost products of human wisdom, and is named by the elder Mirabeau, in a passage quoted by Adam Smith, as one of the three great inventions which have contributed most to the stability of political societies, the other two being those of writing and of money. Its object was to exhibit by means of certain formulas the way in which the products of agriculture, which is the only source of wealth, would in a state of perfect liberty be distributed among the several classes of the community (namely, the productive classes of the proprietors and cultivators of land, and the unproductive class composed of manufacturers and merchants), and to represent by other formulas the modes of distribution which take place under systems of governmental restraint and regulation, with the evil results arising to the whole society from different degrees of such violations of the natural order. It follows from Quesnay's theoretic views that the one thing deserving the solicitude of the practical economist and the statesman is the increase of the net product; and he infers also what Smith afterward affirmed on not quite the same ground, that the interest of the land-owner is 'strictly and inseparably connected with the general interest of the society.'

R

RAILWAYS.—We consider this subject under the following heads: (I) The United States; (II) Foreign Countries; (III) Railway Problems; (IV) Proposed Reforms.

I. THE UNITED STATES.

A. HISTORY.

On July 4, 1828, Charles Carroll, last surviving signer of the Declaration of Independence, laid the first rail of the Baltimore and Ohio Railroad; the first railroad of this country to assume a comprehensive scale. Mr. Carroll said he considered the event "second only to that of signing the Declaration of Independence, if even second to that." The first tram road in America was the Quincy road (1827) for hauling stone for the Bunker Hill monument. The first locomotive in America was imported from England in 1829, for use on the Carbondale and Honesdale Railroad, built by the Delaware and Hudson Canal Company. On the Baltimore and Ohio Railroad, chartered in 1827 and opened 1830, steam was not definitely chosen for the motive power till 1831, horse-power, and even sails, having been tried first. The West Point foundry works built the first American locomotive in 1830, for use on the South Carolina Railroad then being constructed. By 1835 the Baltimore and Ohio had a length of 115 miles. Pennsylvania had nearly 200 miles of road, mainly coal roads; South Carolina, 137 miles open for traffic; Massachusetts, New York, and New Jersey,

nearly 100 each. The panic of 1837 temporarily checked railroad **Beginnings.** building, but the whole line of the Boston and Albany was complete by 1842, the first road operated as a THROUGH route. New York and Philadelphia were connected by rail in 1840; New York and Boston in 1849; New York and Lake Erie, by the Erie road, in 1851; New York and Albany the same year; New York and Chicago in 1853. The first line to reach the Mississippi was the Chicago and Rock Island in 1854.

The rapid growth of the roads in the United States will be best appreciated by giving the figures. In 1828 there were three miles of railroad in the country; in 1830, 41 miles; in 1840, 2800 miles; in 1850, 9000 miles; in 1860, 9800 miles; in 1870, 50,000 miles; in 1880, 82,000 miles; in 1890, 163,420 miles; and June 30, 1894, there were 178,708 miles.

The first roads were very moderately successful. They were rude, cumbersome affairs, with flat rails, often of wood, needing constant repairs. Flat rails were not wholly removed from the New York Central road till 1850.

Legislatures were suspicious of them. The Illinois Central received the first land grant in 1851, though, after that, land grants were given freely. (See PUBLIC DOMAIN.) The first charters were very cautious, and there were

no general bills for condemning property to give railroads the right of way, but in 1850 the New York Legislature granted railroad corporations the right to run their lines wherever they saw fit, subject only to certain conditions in the cities. This was a complete surrender on the part of the State of every attempt to supervise, regulate, and control the operations of railroad corporations, but it seemed productive of such immediate benefits that State after State followed the example.

No evil results of this lack of State supervision were apparent until 1857, when a financial crisis brought bankruptcy to many of the roads. To prevent the insolvent roads being closed to satisfy the bondholders or first mortgagees, the lawyers for the second mortgagees and the stockholders devised a plan of "reorganization." Under this policy of reorganization the first mortgage holders were given bonds representing a first lien on the roads and bonds representing accrued interest. The junior mortgagees were recognized by preferred stock, and the former stockholders, after paying something to defray the expenses of the readjustment, were given common stock to represent their former interest in the roads. This accumulated debt was called "increased capital," but in latter-day parlance has developed stock watering. (See WATERED STOCK.)

The crisis of 1857 put an effective stop to railroad and land grants, and this was followed by the war. The war, however, gave land grants a wider scope. A railroad to California was a political necessity. (See PACIFIC RAILROADS.) The first effective bill for the Union Pacific was passed in 1864, and the last rail laid in 1860. It led to railroad favoritism, upon the part of Government, in colossal proportions.

From 1835 to June 30, 1892, railroad corporations received from Congress, directly and through the States, grants of land aggregating 56,483,804 acres, or an average of 9600 acres for every mile of road constructed under the terms of the granting acts. In addition to these gifts of land the roads received subsidies of money from Congress, the States, counties, townships, cities, and villages. The five Pacific railroads (the Northern Pacific, the Union Pacific, the Atlantic and Pacific, the Southern Pacific, and the Texas Pacific) alone received subsidies of United States bonds amounting to \$64,623,512, and the interest paid on the same by the United States Government amounted, up to June 30, 1891, to \$90,241,379.22. (See art. PUBLIC DOMAIN.)

According to *Poor's Manual* for 1884, the average cost per mile of the railroads in the United States did not exceed \$30,000. The early railroads were purely local, chartered and built by local communities. The New York Central was consolidated from eleven different railroads in 1853. Vanderbilt, till

Land
Grants.

then one of the foremost steamboat owners in the world, did not go into railroads to any extent till 1864. In 1867 he secured control of the New York Central and consolidated it with the Hudson River in 1869, and virtually at the same time obtained a Chicago connection. Mr. Scott entered the service of the Pennsylvania R. R. in 1850. He became vice-president of it in 1860, and president in 1874. As a result of his management the Pennsylvania R. R. owns to-day thousands of miles of the most valuable railway property in the United States. Next to these great systems were developed the Grand Trunk in the north, the Erie in the middle, and the Baltimore & Ohio in the south, they being hindered respectively by disadvantage of situation, by speculation, and by the war.

The next development of combination was the development of sleeping-car companies, express companies, and freight transportation companies, which ran through cars over many roads. The last rapidly developed into the cooperative fast-freight line which has since prevailed all but universally, and is nothing more than a system of looking after cars and keeping accounts between companies. The first railroad pools were probably developed in a small way in New England. The first to have important public history

was the Chicago-Omaha pool, in 1870, between three roads. The first great inter-railway association was the Southern Railway and Steamship Association, first begun under the lead of Albert Fink, in 1873. In 1875 it established a clearing-house to settle through traffic accounts.

The first great railway war began in 1869, when rates from Chicago to New York fell to 25 cents per hundred pounds. At first the New York Central could not compete on long-distance freight with the Erie Canal and Hudson River. In 1871 the canal was helpless. The war of 1869 lasted only a little while; 1874-76 saw bitter railway wars. The fight ended in 1877, not because anything was settled but because all parties were exhausted. The first trunk-line pool on West-bound traffic was formed in 1877, and on East-bound in 1879. Meanwhile a joint executive committee had been formed, with Albert Fink as its head. It arranged as to differentials between cities, as to percentages of traffic between different trunk lines, as to general arrangements, rates, etc., etc. This peace lasted till 1881, when a fierce war raged for eight months, followed by a short peace; war and peace alternating at short intervals down to the present.

As we have seen, railroad legislation was all in favor of railroads. The only fear was that roads would not be built fast enough. Railroads were variously taxed, and liabilities only slightly enforced. The first popular feeling of any force against railroads was the Granger movement (1870-77). Nowhere had railroad subsidies been more recklessly voted than in the Upper Mississippi valley. Between 1865 and 1871, \$500,000,000 had been invested in Western railways. The price of wheat began to fall. With transportation charges at former

figures, the farmers could not pay their debts; with charges reduced, the roads could not pay theirs. Roads under competition cut down rates to nearly nothing between competing points, and, where there was no competition, charged what they would. The feeling among the farmers ran high. They talked it over in the Grange

Granger Movement.

(*q. v.*). The first tangible results were reached in Illinois. The Constitutional convention of 1870 made an important declaration concerning State control of rates, on the basis of which a law was passed in 1871, establishing a system of maxima. Judge Laurence pronounced the bill unconstitutional. At the next election he was defeated. The law of 1873 avoided the issues raised by Judge Laurence. Similar laws were immediately passed by Iowa and Minnesota, and a much more stringent law, the so-called Potter law, which the railroads favored because so stringent, hoping thus to kill it. The roads appealed to the courts, but were defeated. Finally in 1877 the Supreme Court of the United States sustained the constitutionality of the Granger laws. But the laws defeated themselves. Railroad construction came to a standstill. In Wisconsin some existing roads could not be kept up. The men who passed the Potter law in 1874 hurriedly repealed it after two years' trial. Since then, however, the hostility to railroads has grown more general.

The Hepburn committee was appointed in New York "to investigate alleged abuses in railroad management," the hearings before which form the most important evidence in the railway question. In 1877 the strikes called universal attention to the subject. Railway commissions were everywhere established, that of Massachusetts—perhaps the most successful—as early as 1869. The commission of Iowa, perhaps the next most successful, dates from 1878. California gave its commission almost unlimited power. As a result the railroads found it necessary to get control of the commission.

In 1885 the United States Senate appointed a committee to investigate railroad abuses. As a result of that report, Congress enacted a law which went into effect in April, 1887, and the

Railway Commissions.

has been a public institution ever since. During the debates on that bill, the railroad lobby was energetic and active. The intent of the framer of the bill was that the law should give control of the railroads to the Commission to be appointed; but the combined railroad interests of the country went to work to change the bill, and it received the signature of the President in such a form as to be almost worthless. The Commission has been at work for six years; and with the exception of the arrest and punishment, by fine, of minor offenses, no punishment has been meted out. Unjust discrimination still continues, reckless combinations are entered into; passes are issued to legislators, judges, county officials, governors, and clergymen; and where it is deemed nec-

essary to silence the voice of opposition, blocks of railroad stocks are bestowed in liberal quantities. In nearly every State where railroad commissions have been established, they have proved to be failures. Where a determined stand has been taken against encroachments of railroads by a commission, the courts have set aside the verdict of the commissioners.

The Commission itself recognizes the failure of its efforts. It has repeatedly asked Congress for increased power, "but," as it says in its report for December 1, 1795 (pp. 10-12), "for one reason and another the measures heretofore recommended have failed of adoption. . . . The special weakness of the law, as it now stands, is the want of finality and binding force to the decisions of the Commission. . . . The Commission is not a court and has no means of its own for enforcing its order. . . . If a carrier can simply ignore the findings of the Commission and wait for a new trial in the courts. . . . the delay alone substantially defeats the remedy. . . . Until such a result is practically made impossible, the work of the Commission, in its most valuable aspects, must be more or less a disappointment." (See INTER-STATE COMMERCE COMMISSION.)

This brings us down to the present time. For more recent railroad developments, such as railroad combinations, receiverships, etc., see the third portion of the article, Railroad Problems.

B. STATISTICS FOR THE UNITED STATES.

"The report of the statistician to the Commission for the year ending June 30, 1894, contained in Appendix E, was submitted to the Commission on June 1, 1895.

"*Mileage.*

"This report shows that the total of railway mileage in the United States on June 30, 1894, was 178,708.55 miles, an increase during the year of 2247.48 miles. The increase during the previous year was 4897.55 miles. The percentage of increase in 1894 was less than for any preceding year for which reports had been made to the Commission.

"The total number of railway corporations on June 30, 1894, was 1924, an increase during the year of 34. Of this number 745 were independent operating companies, and 945 maintained separate operating accounts. The number of companies maintaining financial accounts only was 895, of which 338 were operated under lease for a fixed money rental, and 188 for a contingent money rental; 243 were controlled through the ownership of stock by the operating company; the remaining 36 returned no information as to the form of control. The number of roads not in operation was 76, of which 60 were independent roads; 10 were subsidiary roads, parts of systems, and 6 were private roads. In addition to the roads already referred to, there were 98 private roads, operated in connection with logging, milling, and mining industries. The movement of consolidation, during the year, on the basis of mileage involved, has been greater than for the year previous; 15 roads, representing 1734.64 miles, have been merged; 22 roads, representing 2351.99 miles, have been reorganized; and 14 roads, representing 1590.34 miles, have been consolidated.

"A classification of railroads on the basis of operated mileage shows that 90 roads operate 72.90 per cent. of the entire mileage of the country, and 44 roads operate 56.30 per cent.

"On June 30, 1894, the total number of locomotives was 35,492, an increase during the year of 704. Of these, 9893 were passenger locomotives; 20,000 were freight locomotives; 5086 were switching locomotives, and 513 were unclassified. The total number of cars reported was 1,278,078. Of these, 33,018 were in passenger service; 1,205,169 were in freight service; and 30,891 were caboose, derrick, gravel, officers', pay, and other cars in the companies' service. These figures do not include cars owned by the shippers or private individuals. The increase in the number of cars during the year was 4132, as against an increase of 58,854 during the previous year. This

Equipment.

falling off in the ratio of increase is due to the fact that the railways have, during the year, destroyed a

large number of old, worn-out cars. The number of passengers carried per passenger locomotive was 54,654, and the passenger miles per passenger locomotive were 1,444,400.

"The law requires that all equipment shall be supplied with train-brakes and automatic couplers by January, 1898, and all cars with grab irons by July 1, 1895, but 74.80 per cent. of the total equipment is still without train-brakes, and 72.77 per cent. without automatic couplers.

"The total number of railway employees on June 30, 1894, was 779,608, a decrease, as compared with the number on June 30, 1893, of 93,994, or 10.76 per cent. This is a smaller number employed than in any year since 1890. This decrease is, of course, due to the heavy falling off in traffic, and the endeavor of the railways to economize. On the basis of four persons being dependent on each wage-earner, it shows that over one-third of a million of people have been deprived of their regular means of support. The class of employees showing the greatest decrease are trackmen, the decrease for this class being 29,443, or 16.34 per cent.; the next largest decrease is 19,890, or 18.91 per cent., for laborers and unclassified employees.

"For 1894 the average daily compensation was, for general officers, \$9.71; other officers, \$5.75; general office clerks, \$2.34; station agents, \$1.75; other station men, \$1.63; engineers, \$3.61; firemen, \$2.03; conductors, \$3.04; other trainmen, \$1.89; machinists, \$2.21; carpenters, \$2.02; other shopmen, \$1.69; section foremen, \$1.71; other trackmen, \$1.18; switchmen, flagmen, and watchmen, \$1.75; telegraph operators and dispatchers, \$1.93, and employees of floating equipment, \$1.97.

"*Capitalization.*

"The total amount of reported railway capital on June 30, 1894, was \$10,796,473,813, or \$62.951 per mile of line. This is an increase in the amount outstanding during the year of \$290,238,403. The amount of capital stock was \$4,834,075,659, of which \$4,103,584,166 was common stock, and \$730,491,493 was preferred stock. The funded debt was \$5,356,583,019, classified as follows: Bonds, \$4,593,931,754; miscellaneous obligations, \$456,277,380; income bonds, \$242,403,681, and equipment trust obligations, \$63,979,204. The amount of current liabilities was \$605,815,135. The amount of railway securities held by the railways as an investment was \$1,544,958,670, a decrease during the year of \$18,963,563.

"The amount of stock paying no dividend was \$3,066,150,094, or 63.43 per cent. of the total amount. Of the stock paying dividends, 4.31 per cent. of the total stock paid from 4 to 5 per cent.; 10.12 per cent. paid from 5 to 6 per cent.; 5.12 per cent. paid from 6 to 7 per cent.; and 5.42 per cent. paid from 7 to 8 per cent. The total amount of dividends was \$95,515,226, or an average rate on the dividend-paying stock of 5.40 per cent. The amount of bonds paying no interest was \$650,573,789, or 14.17 per cent. The amount of miscellaneous obligations paying no interest was \$53,426,264, or 11.71 per cent., and the amount of income bonds paying no interest was \$210,757,554, or 86.94 per cent.

"*Public Service.*

"The number of passengers carried was 540,688,199, a decrease under the previous year of 52,872,413; but passenger mileage, which is the most significant figure, shows an increase of 60,344,809, the total being 14,289,445,893. This increase in passenger mileage was almost wholly occasioned by the World's Fair travel. The average number of passengers in a train was 44, and the average distance traveled by each passenger was 26.43 miles. The passenger mileage per mile of line, which indicates the density of passenger traffic, was 81,333, a slight decrease as compared with the previous report. There was a large decrease in freight traffic. The number of tons carried being 638,186,553, as against 745,119,482 in 1893, a decrease of 106,932,929 tons. The ton mileage was 80,335,104,702, a decrease of 13,253,007,131 from the previous year, and the ton-miles per mile of line decreased from 551,232, in 1893, to 457,252 in 1894, a decrease in density of traffic of 93,980 ton-miles. The average number of tons in a train was 170.80, a decrease of 4.17 tons, showing a decrease of economy in the use of freight equipment. The average haul of one ton was 125.88 miles.

"*Earnings and Expenses.*

"The gross earnings of the railways for the year ending June 30, 1894, were \$1,073,361,797; a decrease, as compared with the previous year, of \$147,390,077, or 12.07 per cent. Passenger revenue decreased \$16,142,258, or 5.35 per cent., and the revenue from freight

traffic decreased \$129,562,948, or 15.63 per cent. The amount of operating expenses was \$731,414,322, a decrease of \$66,506,977, or 11.66 per cent. The largest per cent. of decrease was in the operating expenses assigned to maintenance of way and structure, and to maintenance of equipment, which show, respectively, a decrease of 15.12 and 17.52 per cent. The net earnings were \$341,947,475, a decrease of \$59,883,100 as compared with the previous year. The income derived from sources outside of operations was \$142,816,805. The amount of fixed charges and other deductions from income was \$429,008,310, leaving a net income of \$55,755,979 available for dividends, a decrease, as compared with the previous year, of nearly 50 per cent. The amount of dividends paid was \$95,515,226, a decrease of only \$5,414,659 from the amount paid the previous year. The fact that nearly the normal amount of dividends was paid, notwithstanding the great decrease in income available for them, and that the payment of the amount stated entailed a deficit from the operations of the year of \$45,851,294, is suggestive. The revenue derived from the carrying of passengers was \$285,349,558, or 26.58 per cent. of gross earnings, and the revenue derived from freight traffic was \$699,490,913, or 65.16 per cent. of gross earnings.

A report of the statistician to the Commission on the earnings and expenses of the railways of the United States for the year ending June 30, 1895, was submitted on November 18. It includes the returns from 650 roads, whose reports were filed on or before November 9, 1895, and covers the operations of 164,529.38 miles of line, or 92 per cent. of the total mileage in the United States. The gross earnings were \$1,003,022,853, of which \$293,465,792 were from passenger service, \$683,022,988 from freight service, and \$26,217,595 were other earnings from operation, covering earnings from telegraph, car mileage balances, switching charges, etc. The operating expenses were \$677,667,635, leaving net earnings of \$325,355,218.

"Accidents.

"During the year, 1823 railway employees were killed, and 23,422 were injured, as compared with 2727 killed, and 31,729 injured in 1893. This marked decrease in casualty is in part due to the decrease in the number of men employed, and the decrease in the volume of business handled. The increased use of automatic appliances on railway equipment also may have rendered railway employment less dangerous, and it may be that the grade of efficiency of employees has been raised.

"The number of passengers killed was 324, an increase of 25, and the number injured was 3034, a decrease of 105. Of the total number of fatal casualties, 257 were due to coupling and uncoupling cars; 439 to falling from trains and engines; 50 to overhead obstructions; 145 to collisions; 108 to derailments, and the balance to various other causes, not easily classified. To show the ratio of casualty, it may be stated that 1 employee was killed out of every 428 in service, and 1 injured out of every 33 employed. The trainmen perform the most dangerous service; 1 out of 156 having been killed, and 1 out of every 12 having been injured.

"The ratio of casualty to passengers is in striking contrast to that of railway employees, 1 passenger having been killed out of each 1,668,791 carried, or for each 44,103,228 miles traveled, and 1 injured out of each 178,210 carried, or for each 4,709,771 miles traveled."

II. FOREIGN COUNTRIES.

A. GREAT BRITAIN.

The distinguishing characteristics of the English railroad are its stability and its management by great companies and vested interests. Watts made the use of steam-engines practicable in 1769. Richard Trevithick patented the first steam-carriage in 1802. The first chartered line of rails was laid in 1801—a short horse railroad from Wandsworth to Croyden, in the suburbs of London. Trevithick made the first engine that drew cars on the Merthyr Tydvil Railway in 1804. Locomotive power was first made actually efficient by George Stephenson in 1814. The first locomotive that drew passengers, George Stephenson's "Rocket," was used on the Stockton and

Darlington Railway, which was completed in 1829.

The great period of English railway building began in 1845. Parliament since then has constantly been busied with railroad legislation. Various commissions have been appointed, but without great success. The English roads have sometimes openly defied them, and have even been sustained in the courts in their defiance. Says Mr. Adams: "As a result of forty years of experiment and agitation, Great Britain has on this head come back very nearly to its point of commencement. It has settled down on the doctrine of *laissez-faire*." Says Professor Hadley: "This is not quite right. It might better be said that it has settled down on the policy of specific laws for specific troubles." Competitive rates exist in England, but are not common. In 1886 the rate from Glasgow to London on the beef of American cattle slaughtered on the wharf was 45s. per ton. On Scotch meat it was 77s. Foreign hops were charged 17s. 6d. per ton from Boulogne to London. English hops from intermediate points were charged 35s. Mr. Robert P. Porter, superintendent of the last United States census, in a syndicate letter, which appeared in a number of papers December 9, 1894, gives an interview with James Hole, secretary of the Association of Chambers of Commerce of the United Kingdom, representative of vast financial interests.

"'You may safely state,' said Mr. Hole, 'that to-day some score of persons, linked together by a common interest, control nearly one thousand millions sterling of capital and 20,000 miles of the most important communication of the country.'

"'When we want to compete on the Continent we find ourselves driven out of our old markets by lower foreign rates. Girders from Belgium were sent through Grimsby for a lower rate per ton, though there is loading and unloading twice over, than from Sheffield to Grimsby, with one loading and unloading. The Northumberland farmer says, 'It will cost me more to send cattle to Liverpool than to send them from Chicago or New York.' It costs more to send grain from the Eastern counties to Birmingham than it does from Odessa, and it costs more to send cheese from Cheshire to London than to take it from New York right past the Cheshire stations to London.'

But bad as are the conditions in England, Mr. Hole declare that they are much worse in Ireland, as he shows by the following particulars:

"'In the recent inquiry [1889-90] one witness after another gave evidence of the shortcomings of the Irish railways. Throughout Ireland there was the strongest complaint of the inadequacy of station accommodation, especially for cattle, which lay about in the road, waiting for wagons. The high coal and mineral rates of the local lines check all enterprise and are prohibitive to the industry of the country. It was cheaper to send cattle by road than by rail; cheaper to take coal from Scotland to a seaport than to get it 10 miles inland; cheaper to carry goods to England and have them reshipped to Ireland at through English rates than to pay the local rates. Goods are often shipped from the eastern seaboard for Sligo and Ballina via Glasgow. The rates from Belfast and Drogheda are as high as between Belfast and English towns. The high charges have injured the woolen, the flax, and the milling interests, yet the new schedule proposed to give power to raise them from 40 to 70 per cent. A parcel travels 500 miles in England for half the price it costs for 30 miles in Ireland. Average passenger fares in England are 8½d.; Scotland, 10½d.; but in Ireland, 15, 3½d. Such are some of the items in the indictment of the Irish railways.

"'Yet the total 2500 miles of Irish railway have to

look after them 303 directors, 97 secretaries, engineers, and managers, and about 60 auditors and solicitors..”

The causes that have led to these unbearable conditions are summed up by Mr. Porter in the statement of the following facts furnished him by J. S. Jeans, secretary of the British Iron-Trade Association :

“ There seem to be two causes : first, the excessive cost of English railways, and secondly, the fact that the shareholders must receive at least 5 per cent. for their investments. The railway system of England and Wales has cost £55,000 per mile (\$267,657.50). This, I suppose, is more than double the cost of the railways of any other country. To pay a dividend of 5 per cent. on their capital stock the railways of England and Wales must earn £2750 (\$13,382.87) per mile.”

But there is a good side to the cost of English railroad-building. Professor Hadley says of the English railway system in substance (see his *Railroad Transportation*, 1885).

“ The traveler sees its massive roadbed, its absence of grade crossings, its tunnels and viaducts. The statistician sees the fact that it cost \$200,000 per mile, compared with the American cost of \$60,000 per mile. The humanitarian sees the lessened loss of life. The railroad man sees permanent traffic agreements and a smooth-working railway clearing-house, compared with American pools and fights. The legislator sees the obstinate and blustering tone of the railroads in talking of their vested rights.” America built her roads for the present, England hers for the present and future. England built with plenty of capital, and with double tracks and no grade crossings, from the start. Stock-watering is largely absent. The rail-

roads have had no great excuse to enlarge their capital for ‘improvements.’ English roads do all the work connected with the roads. They provide sleeping-cars, do their own expressage and their own city collection and delivery of freight. They provide hotels, etc.”

The following statistics of railways in Great Britain and Ireland are from the *Statesman's Year Book* for 1896 :

YEAR.	LINE OPEN.	AVERAGE YEARLY INCREASE.
	<i>Miles.</i>	<i>Miles.</i>
1850.....	6,621	165
1860.....	10,433	381
1870.....	15,537	510
1880.....	17,933	240
1890.....	20,973	214
1894.....	20,908	209

Of the total length of lines open January 1, 1894, there belonged to England and Wales 14,536 miles, to Scotland 3328 miles, and to Ireland 3044 miles.

The following table gives the length of lines open, the capital paid up, the number of passengers conveyed, and the traffic receipts of all the railways of the United Kingdom in 1878, and each of the last seven years :

YEAR.	LENGTH OF LINES OPEN AT THE END OF EACH YEAR.	TOTAL CAPITAL PAID UP (SHARES AND LOANS) AT THE END OF EACH YEAR.	NUMBER OF PASSENGERS CONVEYED (EXCLUSIVE OF SEASON-TICKET HOLDERS).	RECEIPTS.		TOTAL, INCLUDING MISCELLANEOUS.
				From Passengers.	From Goods Traffic.	
	<i>Miles.</i>					
1878....	17,333	£698,545,154	565,024,455	£26,889,614	£33,564,761	£62,862,674
1888....	19,812	864,695,963	742,499,164	30,984,090	38,755,780	72,894,665
1889....	19,943	876,595,166	775,183,973	32,630,724	41,086,333	77,025,017
1890....	20,073	897,472,026	817,744,046	34,327,965	42,220,382	79,948,702
1891....	20,191	919,425,121	845,463,668	35,130,916	43,230,717	81,860,607
1892....	20,325	944,357,320	864,435,388	35,662,816	42,866,498	82,092,040
1893....	20,646	971,323,353	873,177,952	35,899,449	40,994,637	80,631,892
1894....	20,908	985,387,355	911,412,926	36,495,488	43,379,078	84,310,831

The capitalization at the end of 1894 was £811,814,465 for England, £131,418,959 for Scotland, and £39,154,831 for Ireland. The receipts were £71,934,167 for England and Wales, £8,981,077 for Scotland, and £3,395,587 for Ireland. The total expenditures were £47,208,313 or 56 per cent of the total receipts.

B. BELGIUM.

In England and America the maxim is, says Professor Hadley, that “ whatever can be done without Government, should be thus done.” On the Continent it is, that “ whatever can be done by Government, should be.” Belgium led in this. She began as early as 1833. King Leopold was familiar with English business, and built the roads to compete for through freight from Germany, that hitherto had gone through Holland down the Rhine. The system was complete by 1850. The State allowed private companies to build lesser and branch lines. The private companies were freer to make rapid improvements, and so gained for a while on the State, but finally the State competed with them, and won. Pro-

fessor Hadley, in 1886, though not a believer in State roads, says the Belgian passenger rates are lower than anywhere in the world except a few East Indian roads.

The length of railroads open in Belgium January 1, 1895, was :

Lines worked by the State.....	<i>Miles</i> 2025
Lines worked by the companies.....	795
	2820

Up to the end of 1894 the State had spent 1,392,564,484 frs. on the first cost of the railways. The net receipts were 1,441,156,021 frs., and the financial charges were 1,380,589,684 frs.; leaving 60,567,337 frs. The number of passengers conveyed in 1894 was 74,773,172 for the State, and 22,165,605 for the companies. The gross receipts in 1894 were : for the State, 152,974,889 frs., and for the companies, 41,591,780 frs. The expenses for the State were 86,537,469 frs., and for the companies, 20,086,984 frs.

Every possible improvement is being introduced on the Belgium railways. Iron rails are gradually being replaced by steel ones,

and the latest improvements in other respects are being adopted. The Westinghouse brake has not yet been applied to all trains, but the reform is being rapidly effected.

As showing the exceptional care with which the lines are worked by the State, the following figures may be given. Since the origin of the State railways in 1835, to 1891, there have been 93 persons killed in collisions and "derailments"; namely, 33 passengers and 60 employees. The number of passengers killed in stations, in consequence of their imprudence or inattention, figures at 147, and the number of employees of the administration, at 1885. Besides travelers and employees, 1062 persons have lost their lives in crossing the lines when trains were in motion. An additional 461 are put down as having been victims to drink or suicide.

A 20 per cent. reduction is allowed on all return tickets. The amount taken for single tickets in 1891 was 15,699,297 frs.; the amount for return tickets, 26,168,012 frs.; making a total of 41,867,209 frs. This amount is exclusive of the amount received from contract ticket holders, members of societies, and emigrants, excursion trains, circular tours, children, and soldiers, etc., which bring the total receipts up to 67,432,178 frs. As all these latter categories go at reduced rates, 49,732,981 frs., or 73.8 per cent. of the total, traveled at reduced rates. The proportion was 75.7 per cent. in 1890.

The workmen generally are contented; their wages are slightly above the average of Belgian workmen, and they enjoy many privileges. In many cases they have cottages free, or at a minimum rental; they have certain articles of clothing free and their children are carried free to and from school when that is necessary. A workman on the railway is a fixture for life if he behaves himself and attends to his work. He enjoys a pension when no longer fit for service.

C. FRANCE.

French railroads were late in development. While other nations went ahead, the French watched. When they did build, they built a whole carefully planned system. There was no competition from the start. The plan they adopted then they largely follow to-day.

The first line worked by steam had previously, for many years, been worked by horses. This was the St. Étienne line, opened as a railroad in 1828. A few other incorporated lines were built between that time and 1833, when the Government began a comprehensive system of surveys, and laid down a general scheme of railroad development for the whole country.

The plan was settled in 1842. Thiers was its author. The State was to contribute \$50,000 per mile and own the roadbed. Private enterprise was to do the rest. Dividends on investment were guaranteed by the State. After 40 years the whole was to revert to the State. Under this plan 33 companies were chartered, tho by 1852 they had consolidated to 11, and soon after to 6. Railroad-building went on rapidly from 1842 to 1848, and then

again after the Revolution and the accession of Napoleon III., from 1851 to 1857. This increase was caused by changing their charters to last 99 years, so that they are now to revert to the State about 1950.

By 1875 a considerable number of local lines had been built, on which the Government guaranteed interest at 4 per cent. and a trifle over to form a sinking fund. In 1875-76 efforts were made by speculators to amalgamate these district lines and form them into systems which should compete with the old systems. The State was asked to purchase them, but the vested interests of the older companies prevented this, and so, like the rest, they came under State supervision.

In 1877 there was a strong movement toward State ownership. The cause was mainly a desire to rival Germany. The railroads of the southwest were taken under direct State management. The State still operates the roads in the southwest, but only exerts control over the rest. It favors local traffic rather than competition for through freight, and thus develops the country for the future.

The Government has a highly trained staff of engineers, whose duty it is to supervise the lines. In addition, there are about 800 officials, costing, together with the engineers, \$800,000 per annum. The Government has its agents at all the principal stations, and the time-tables, as well as the tariffs, are subject to its approval. The accounts of the companies, also, are subject to annual examination. "There are all the disadvantages of extreme officialism without the advantage of public ownership," says Waring in his *State Purchase of Railways*.

The system of monopoly is good for the shareholders, but bad for the nation as a whole. There are several thousands of rates which are a burden and a weariness to the community, and from which they pray daily to be delivered. The express trains are so only in name, few of them reaching so high a speed as 40 miles an hour. The long-distance traffic is subject to many disadvantages. These things show the difficulties under which the dual system works. The Government, however, is by no means blind to what is needed, and from time to time introduces a modicum of reform. Still less fortunate are the financial relations between the Government and the subsidized corporations. For the years 1884-90, alone, the French Government was obliged to supplement the dividends to the amount of 369,000,000 frs., under the law of November 20, 1883, which established their relations anew. At the end of 1883, the claims of the State against the railway companies amounted to 673,000,000 frs.

To these criticisms on the French railroad system, it ought to be added that many of the technical arrangements of the French lines are admirable, and can hardly be excelled in any country in the world. The lines are carefully worked, the percentages of accidents and of deaths from accidents are relatively low, and on the whole their employees are well treated and well cared for.

The report on France of the (English) Royal

Commission on Labor gives the wages paid by one company as, in 1892, 6¼ frs. for engineers with an annual increase of 6*d.* a day until it has reached 9 frs. (\$1.80). Guards and brakemen received from \$260 to \$410 per year, laborers from \$200 to \$310. Sunday labor is paid at the rate of time and a half. A pension fund is established to which the company and the employees contribute equal proportions. Aid is granted by the company to employees in need.

D. GERMANY.

The German railroads have no one system. They were built by the local States, and were in this sense State roads. There was a federation of railroads but no national policy. About 1842 the policy of subsidies came into vogue. In 1848 Prussia built the first really State built and managed German road, a railroad toward Russia, and down to 1860 the Prussian Government quietly pushed this policy, buying and building railroads. When Bismarck came into power in 1861, military reasons thrust industrial arguments into the background. The French war showed the military advantage of State roads. Roads were developed rapidly till the crisis of 1873, but the system was effectually "mixed," State roads competing with private ones. Prussia in 1874 owned about one-third of her roads. A railroad department was established in 1873. Bismarck then commenced a strong agitation for a national or imperial system, but was largely foiled through States-right doctrines and jealousy of Prussia. Prussia then went ahead alone. By 1881 the State owned 7000 miles of road and virtually managed 2000 more. In 1885 there were 13,000 miles of State roads and only 1000 miles of private roads. The prices paid in buying roads were high. The stockholders of the Berlin-Hamburg road secured an income of over 16 per cent. on their investment. The Government could have taken the roads at valuation, but preferred to raise no hostility. Meanwhile other German States were moving.

In the Middle German States the principle of State ownership had received an early recognition. The Baden and Würtemberg Governments became owners of their railways almost from the moment of their construction. The Bavarian railways on the right bank of the Rhine have belonged to the State since 1875, but private ownership prevails to a certain degree in the rest of Bavaria. The Saxon Government began to purchase their railways in 1876, and are now owners of a complete system.

The great majority of the German railways are now owned by the Imperial or State Governments. Out of 27,871 miles of railway completed and open for traffic, only 3170 miles belong to private companies, and of these 368 are worked by Government. Narrow-gage lines measure 832 miles (Government lines 362 miles).

The total capital in 1894 was 11,105,722,000 marks, the annual expenditure 863,309,000 marks, the receipts 1,413,523,000 marks, the percentage of the surplus on the capital 4.95.

In the *Journal of Political Economy*, Professor Gustave Cohen says:

"Each year the railways not only paid in full the interest on the railway debt, but that on the entire State debt; in addition they yielded a very substantial surplus, which in the fiscal year from April 1, 1889, to March 31, 1890, reached the maximum amount of 145,000,000 marks. Since then this surplus has, it is true, diminished; but it still amounted for the last year (1891-92) to about 90,000,000 marks. Moreover, in accordance with the law of March 27, 1882, more than 550,000,000 marks of the railway debt has been extinguished. Altho one might justly feel satisfied if the railways paid the interest on their own capital, expectations were so raised by the abundance of the surplus that the demand was now not merely for a surplus, but for a great surplus, constantly increasing with the constant increase in the needs of the general administration of the State."

In a word, the result has been so satisfactory in Prussia that no one outside of the radical's position ventures to attack the policy. The chief defects of the present system of management are to be found in the administrative organization.

The railway staff on the State railways is composed of government officials with workmen paid by the day. A number of posts on the State railways, which do not require special technical training, are filled with soldiers of the reserve. The total force employed on all railways amounts, in round numbers, to 110,000 officials and 200,000 laborers. The hours for workmen in the railway workshops are given in one set of working rules as from 6:50 a. m. to 6:30 p. m. with an interval of 1 hour and 40 minutes at mid-day. As a rule the actual working hours are 10. Wages are paid twice a month and in cash only.

E. ITALY.

Italy has some of the best built railroads in the world (at least as far as difficult engineering goes), but her railroads have not been financially successful, perhaps because of constant variations in her Government. In 1878 a railroad commission was appointed to investigate, and they collected what is considered, by some, the most valuable body of information in the world concerning the railroads of all countries. They decided against State railroads as being more expensive and in danger of being used for political purposes. As a result the lines owned by the State were leased to private companies at contracts for 60 years, but which may be terminated before. Professor Hadley considers this strong argument against State railroads, but cheaply built and managed railroads, others argue, are not always the best.

January 1, 1891, there were 5246 miles of State railway, 2794 of companies' roads, and 96 of joint State and companies' roads. In 1890 the receipts were 255,687,108 lire, and the expenses, 193,879,424 lire; 50,855,569 passengers were carried.

F. SWITZERLAND.

Switzerland does not possess State railroads, yet her whole system is under the direct control of the Government.

Railroad construction in Switzerland began in 1844.

Nothing can exceed the skill with which en-

gineering difficulties have been overcome on all these Alpine lines. The St. Gothard, which was an international undertaking between Switzerland, Italy, and Germany, is the most conspicuous of these successes. It was begun in 1872 and finished in 1880, and is $9\frac{1}{4}$ miles in length.

A still greater piece of engineering work—the construction of a railroad tunnel through the Simplon—was resolved on in 1891.

All legislation respecting the construction and working of railroads, belongs to the Confederation.

The rate of speed is about the same on the Swiss railroads as on other Continental lines, on most of which 29 miles an hour is regarded as express rate, whereas in England nothing under 40 miles an hour is called "express" speed. But there is more excuse for this slowness on the Swiss lines than on Continental lines generally, the curves having frequently to be sharper and the grades greater.

The cost of the roads, up to the end of 1893, was 1,090,103,050 frs. The receipts in 1893 were 101,482,318 frs., and the expenses, 60,190,897 frs.

According to the report on Switzerland of the (English) Royal Commission on Labor, the wages of Swiss engineers average 1970 frs., guards from 1080 to 1380 frs., and brakemen 900 to 960 frs.

G. RUSSIA.

September 1, 1895, Russia had in Russia, Poland, Siberia, and Caucasia, 13,506 miles of State roads, and 7427 of private roads; in Finland, Turkistan, etc., there were 1487 miles more, with 8106 miles being built. The Trans-Siberian road of 4950 miles it is proposed to complete in 1905, at an estimated cost of 150,000,000 rubles. The total capital spent on Russian railroads to January 1, 1894, exclusive of Finland and the Trans-Caspian roads, was 2,145,000,000 metallic r. (\$1,683,750,000). The share of the State in private roads was 2,006,000,000 metallic r., or 94 per cent. of their total cost. In 1893 the State paid 6,497,578 r. to private, and 8,736,223 r. to State roads. The revenue from the State roads was 81,098,371 r., but 80,733,350 r. were paid in interest on borrowed capital and for purchasing new lines. A zone tariff was adopted in 1894, and now a journey of 1089 miles can be made for 16 rubles and 80 copecks. The roads are wonderfully well kept, but the employees, 20 per cent. of whom may be women, are poorly paid.

II. OTHER EUROPEAN COUNTRIES.

Austria had, January 1, 1895, 4950 miles owned and worked by the State, 589 owned by companies and worked by the State, 4561 owned and worked by companies.

Hungary had 6725 State and 1492 private roads.

The total cost of the Austrian roads down to 1893 was 2,974,905,000 florins. The receipts of the Austrian roads in 1893 were 242,672,000 florins, and of the Hungarian, 102,591,000 florins; the corresponding expenses were 137,142,000 and 53,702,000 florins. See ZONE SYSTEM for an account of the Hungarian system.

In Austria, according to report on Austria of the (English) Royal Commission on Labor, engineers receive 500 florins and an allowance of 200 florins for house rent, guards and porters receive 400 florins, and an allowance of 150 florins, besides uniform, fuel, aid in sickness, etc.

Denmark in 1894 had 1332 miles of road, 1067 of this belonging to the State, the cost of which, up to March 31, 1895, was 190,080,660 kroner. Holland in 1894 had 1667 miles of railway, of which the State owned 891. The State roads in 1894 received 19,880,000 guilders and expended 18,244,000. The private roads received 14,140,000 guilders and spent 11,061,000. The total expenditure on the State roads up to 1898 was 266,181,000 guilders. Spain, January 1, 1894, had 6708 miles of railway, all owned by private companies, with government gratuities or subsidies. Sweden at the end of 1894 had 5734 miles of road, 1899 belonging to the State. The receipts in 1893 were 51,112,740 kroner, and the expenses 31,987,328 kroner. The total cost of construction on State roads to the end of 1893 was 276,839,156 kroner. Norway had in 1890 960 miles of State roads and 42 miles of private road. The receipts of the State roads, 7,607,755 kroner, and the expenses were 6,303,137 kroner.

I. ENGLISH COLONIES.

Canada had 15,768 miles of railway completed June, 1894, with concessions for 4000 miles more. The receipts in 1894 were \$49,552,528, and the expenses \$35,218,433, leaving a net profit of \$14,334,095 on a paid-up capital of \$887,975,020. The Cape of Good Hope, December, 1894, had 2253 miles of State and 188 miles of private railways. The capital expended on the State roads to the end of 1894 was £20,296,943. The earnings in 1894 were £2,713,735, and the expenses £1,483,771.

In India and dependencies there are 18,855 miles of railway: 5377 owned and worked by the State; 8767 owned by the State and invested by private companies; 20,586 worked by guaranteed companies; the rest owned by native States and worked by them or companies. Up to 1895 the State had spent on roads, including those under survey, 255,253,039 rs. The total earnings in 1894 were 25,508,856 rs., and the total expenditures, 11,983,920 rs., or 96.78 per cent. of the gross earnings.

In Australasia almost all the railways are State roads. At first, however, this was not the case. The first roads were private, but with little capital at their command. Unable to obtain land grants, and with weak credit, poor management, and small traffic, the private roads one after another fell into the hands of the Government to satisfy the claims which arose under the guarantee of interest. Most of the roads were acquired by the Government soon after their completion.

The first step in the direction of a State-road system was the purchase of the Melbourne, Mount Alexander, and Murray River Railway (running into the gold-mining regions) in

India.

Australasia.

1856. The Geelong, Melbourne, and other roads followed soon after. In 1857 came legislation looking to the continuance of railway construction by the Government. But the general intention at that time was to lease the roads as soon as possible to private companies. Despite abuses and mismanagement in the government offices for the operation and extension of the roads, the advantages of government ownership and operation became clearer as time went on; so that by 1868 the State-road system may be said to have been finally decided upon.

The policy was begun in Victoria, but has spread through all Australasia. Says Mr. Dilke in his *Problems of Greater Britain*: "It has now become an axiom of Australian policy that the State should own all the railways" (vol. i. pp. 272-273).

There have been obstacles, but they have been gradually overcome. Mr. Dilke says:

"It is generally admitted in Victoria that there were many blots on the system of State control of railways until the appointment of a board of three commissioners independent of political influence. It is confessed that the management of a large department, spending a vast amount of money upon labor, when in the hands of political ministers, is often worked for political ends. 'Log-rolling,' in the construction of railways for private advantage, admittedly existed. It was sometimes found in Victoria that weak ministries, clutching at straws to save themselves from drowning, were willing to risk the future prosperity of the system for a little temporary help in the hour of trouble. Yet, even under political management, the railways of Victoria seem not to have been badly managed on the whole, and to have given a fair amount of satisfaction to the people. They were worked at a slight loss, but railways were constantly being pushed out into sparsely peopled districts, and the State was willing to look forward to the time when, the population having followed the railroads, the land near them would be well settled, and the railroads no longer a charge upon the State. That time has come. The commissioners are now working the lines upon a commercial basis, and the railway system of Victoria is self-supporting; the average rate of profit on capital expended having reached 4 1/4 per cent. The railways could have been made to pay a better return upon the capital invested, but the object of the State in the colonies has never been to make money directly from the railroads, but rather to encourage industry and to render service to the people. Fares and freights have been constantly lowered, so as to keep the revenue at a figure which would just pay all expenses. The profit that would elsewhere have gone into the pockets of shareholders, with no check save that supplied by the competition of other lines—a competition which in itself implies the creation of unnecessary lines, and the sinking of unnecessary capital—has in Victoria been converted into a means of lightening the load upon the farmers, and permitting graziers at great distances from Melbourne to supply that city with beef at moderate prices" (vol. i. pp. 196-197).

"The railways are used for the spread of education, and in New South Wales and some other colonies the school children are carried free of charge. In Victoria remissions of fares are made in the case of students in the schools of mines and in the schools of design. Specially low rates exist in all the colonies for suburban traffic. The fares in the neighborhood of Melbourne, for a district nearly 30 miles across, are, for single journeys, 1*d.* a mile, first class, and 3/4*d.* a mile, second class; and return tickets are given at 3/2*d.* a mile first class, and 1/2*d.* a mile second class; while monthly, quarterly, half-yearly, and yearly tickets are granted at great reductions even upon these low rates. The result is a wonderful spread of suburban railroad traveling, and the custom in Victoria is so developed that, out of the large number of persons working in Melbourne who come in by train every day, a considerable proportion come to the town a second time in the evening, to visit the theaters. The lowness of railway fares in Victoria is the more striking when we remember that wages

are twice as high for shorter hours as they are in England, and that coal costs nearly twice as much. No one in Victoria now advocates private ownership of railroads" (p. 198).

Not everybody admits this. Some individualists claim that Australian State roads have not paid, and it is true that they have not always paid, but this may be because the policy has been pursued of low rates in order to develop the commerce of the country. On the whole, however, they have paid. The following figures for Australasia are from the *Statesman's Year Book* for 1896:

COLONIES.	Miles of Rail-way.	Cost of Con-struction.	Revenue.	Expenditure.	Percentage of Expenditure to Revenue.
New South Wales.....	2,531	£36,611,336	£2,878,204	£1,567,589	54.46
New Zealand.....	2,168	16,142,667	1,150,852	732,160	63.62
Queensland.....	2,379	16,469,721	931,903	580,477	62.28
South Australia.....	4,792
Victoria.....	3,020	37,558,563	2,726,159	1,639,419	60.00
Western Australia.....	1,150

These statistics are for financial years closing in 1894.

III. RAILROAD PROBLEMS.

Perhaps the most serious railroad problem in the United States and elsewhere is the relation of the railroad to the State. A railroad under present laws must receive a charter from the State, and usually it looks to the State for valuable concessions and grants, which are given because railroads are supposed to aid, and beyond all possible doubt have uncalculably aided, the material development of the community. They are thus in one sense creatures of the State. In another sense they threaten to be masters of the State; and this condition has grown, it should be remembered, not out of any special evil or tyrannical intent or conspiracy on the part of railroad corporations, but almost inevitably out of the present situation. Railroad business in perfectly legitimate channels assumes vast proportions; a charter or a certain bill, or the defeat of a certain bill, may be worth to a railroad thousands or even millions of dollars. The legislators know this. They see an immense possibility for personal gain. Even a single vote for or against a bill may be worth to a railroad corporation many thousands of dollars, for the bill may turn upon a few votes, perhaps upon a single vote. The temptation to the legislator to sell that vote and the temptation to the railroad to gain votes by direct, or by indirect yet equally effective corruption, becomes almost irresistible to average human nature. In a country like the United States especially, where the tendency has been to minimize the function of the State and to magnify the function of the private individ-

The Nation and the State.

ual or corporation, government has not as a rule attracted the best men to its service. Legislators are often composed of second or third rate men. Opportunities for corruption in public life, and the very complexity and frequency of elections, have attracted to it politicians of the worst sort. They have not been superior to the enormous temptations to grant franchises and other railroad legislation for a consideration. The system once established, it has become almost impossible for a railroad corporation to be pure, if it desired to be. To secure an honest franchise or measure, honest means have become well-nigh impracticable. If one corporation will not buy its legislation another will, and the honest corporation is handicapped. Legislation goes to that corporation able and willing to give the most, not to the State or to the community, but to the legislature. The railroad lobby, by no peculiar viciousness of railroad men, but by the very necessary magnitude of its interests, becomes the worst and most corrupt lobby. This attracts to the business the shrewdest and least conscientious men. The public denounces the railway and the railway magnate. It forgets that the men are but the perfectly natural and almost inevitable result of the situation. Companies are formed to secure legislation, and bills introduced, with no thought of securing action, but to gain a franchise or a grant to be sold, or with which to blackmail some existing corporation. The situation becomes complicated and corrupt in the last degree. For some detailed evidence, see PLUTOCRACY. Of the United States, said Charles Francis Adams in 1880:

"I consider the existing system nearly as bad as any can be. Studying its operations, as I have done long and patiently, I am ready to repeat now, what I have repeatedly said before, that the most surprising thing about it to me is that the business community sustains itself under such conditions."

The report of the Hepburn Committee in New York State says of railroad abuses, that they are "so glaring in their proportions as to savor of fiction rather than actual history."

Such conditions have occasioned the efforts for the State to control the railroads. Interstate commissions have been created, but these have failed (see Section I. of this article; also see INTERSTATE COMMERCE COMMISSION). They have often but given the occasion, and under the present system almost the necessity, of the railroads to ignore the Commission, to violate the laws, or, more frequently, to secure representation in the legislatures, and sometimes to make restraining laws of no effect. Meanwhile other problems spring up. The railways are combining. Finding competition disastrous and railway pools ruinous, the inevitable result is consolidation and combination.

The following table, taken from the reports of the Interstate Commerce Commission for the given dates, shows the statistics of consolidation:

RAILROADS.	1890.	1891.	1892.	1893.	1894.	1895.
Abandoned	15	16	9	19	16	14
Merged	34	53	19	28	15	9
Consolidated.....	50	39	16	16	14	28
Owned by	7	5	1	11	3	1
No longer in existence	2	1	1	6	1	11
Total.....	108	114	46	80	49	63

Thus in six years 460 railways have disappeared as separate roads, an average of 75 a year. There were in 1894 only 745 independent operating companies. Nor does even this show the real situation, for according to the report of 1895, 43 roads in the United States, or scarcely 2 per cent. of the whole number of railroads reported, owned 100,714 miles of road, or 55.67 per cent. of the total mileage. Over one third of the total mileage had been swallowed up by other roads in six years, besides the large amount of mileage which has been "reorganized," and very often virtually consolidated in the process.

That the tendency of the times, as well as the law, is toward the still more rapid accumulation of the vast railroad interests in the hands of the few, is evidenced in the statements of the most experienced of railroad managers themselves. Mr. McLeod, president of the Reading Combine, in his testimony before the committee of the New York Legislature, admitted that the competition of the roads that were not consolidated with the Reading was the only thing that could prevent the combine from advancing the price of coal to such figures as its managers saw fit to name. He also emphatically stated that freight rates had in no way been regulated or interfered with by the Interstate Commerce Commission, and that the logical consequences would be that if all the roads in the country were under the practical management of one corporation, the public would be correspondingly benefited. C. P. Huntington recently expressed the opinion that all roads in the United States should be under the management of one syndicate having absolute control. With such governmental control as we have had, there is nothing, except the will of the railway directors, to prevent the consolidation of all railroad interests under one management.

How widespread and universal is the restraint of competition by railway corporations may be seen by the following pithy words, penned by Charles Francis Adams, president of the Union Pacific Railway:

"Irresponsible and secret combinations among railways always have existed, and, so long as the railroad system continues as it now is, they unquestionably always will exist. No law can make two corporations, any more than two individuals, actively undersell each other in any market, if they do not wish to do so. But they can only cease doing so by agreeing, in public or private, on a price below which neither will sell. If they cannot do this publicly, they will assuredly do it secretly. This is what, with alternations of conflict, the railroad companies have done in one way or another; and this is what they are now doing, and must always continue to do, until complete change of conditions is brought about. Against this practice, the moment it begins to assume any character of responsibility or permanence, statutes innumerable have been aimed, and clauses strictly interdicting it have of late been incorporated into several State constitutions. The experience of the last few years, if it has proved nothing else, has conclusively demonstrated how utterly impotent and futile such enactments and provisions necessarily are."

Nor, *economically*, is the combination of roads in all ways to be deplored. No one can travel on small roads absorbed by large ones without realizing that accommodations are improved, new and better depots built, fares at least frequently reduced. Few economists to-day look to competition as the means of lowering railway fares. In the first place, competition, for the large majority of railway stations, cannot exist. Says C. W. Baker, in his *Monopolies and the People*:

"There are now [1889] in the United States about 37,000 railway stations where freight and passengers are received for transportation. Now, from the nature of the case, not more than 10 per cent. of these are or can be at the junction of two or more lines of railway. (By actual count, on January 1, 1887, 8 per cent. of existing stations were junction points). Therefore, the shippers and buyers of goods at nine-tenths of the shipping points of the country must always be dependent on the facilities and rates offered by a single railway. Such rates of transportation as are fixed, be they high or low, must be paid, if business is carried on at all. And when we consider the 10 per cent. of railway stations which are, or may be, junction points, we find that at least three-fourths of them are merely the junction of two lines owned by the same company. Consolidation of railway lines has gone on very rapidly within the past few years, and is undoubtedly destined to go much further. Of the 153,000 miles of railway in the country, about 80 per cent. is included in systems 500 miles or more in extent; and a dozen corporations control nearly half of the total mileage. The benefits which the public receive from this consolidation are so vast and so necessary that no one who is familiar with railway affairs would dream of making the suggestion that further consolidations be stopped or that past ones be undone.

"Assuming that the total number of railway junction points in the United States is 3000, we find, on examination, that at about two-thirds only two lines meet, and at more than half the remainder only three lines meet. It is plain that in the vast majority of cases where two roads intersect, and in many cases where three or four come together, the lines meet perhaps at right angles and diverge to entirely different localities. The shipper bringing goods to the station, then, may choose whether he will send his goods north, or east, perhaps; but only in the few cases where two lines run to the same point does he really have the choice of two rates for getting his produce to market. Practically, then, there are not, and never can be, more than a few hundred places in the country where shippers will be able to choose different routes for sending their goods to market. We say there never can be, because the building of a line of railway to parallel an existing line able to carry all the traffic is an absolute loss to the world of the capital spent in its construction, and a constant drain after it is built in the cost of its operation. This fact is now, fortunately, generally appreciated."

Competition, too, implies great waste. In his *Questions of the Day*, Professor Richard T. Ely, referring to the building of great railways with closely paralleled roads, makes this point, and says of two of these roads alone—the Nickel Plate and the New York, West Shore, and Buffalo:

"It is estimated that the money wasted by these two single attempts at competition amounts to \$200,000,000. Let the reader reflect for a moment what this means. It will be admitted that, taking city and country together, comfortable homes can be constructed for an average of \$1000 each. Two hundred thousand homes could be constructed for the sum wasted, and two hundred thousand homes means homes for one million people. I suppose it is a very moderate estimate to place the amount wasted in the construction of useless railroads at \$1,000,000,000, which, on the basis of our previous calculations, would construct homes for five millions of people. But this is probably altogether too small an estimate of even the direct waste resulting from the application of a faulty political economy to practical life. When the indirect losses are added, the result is something

astounding, for the expense of a needless number of trains, and what would otherwise be an excessively large permanent force of employees, must be added. Of course, nothing much better than guess-work is possible, but I believe that the total loss would be sufficient to provide the greater portion of the people of the United States with homes."

Of this Mr. Baker says:

"But it seems quite possible to make a closer estimate of the wealth wasted by the construction of unneeded railways than the general one above. There are now, in round numbers, 158,000 miles of railway in the United States. The two lines named above have a total extent of nearly 1000 miles; and while they are the most flagrant examples of paralleling in the country, there is no small number of other roads in various parts of the country which, except for their competition with roads already constructed, would never have been built. Considering the fact that the paralleling has been done in regions where the traffic was heaviest and where the cost of construction was greatest, it seems a conservative estimate to say that 5 per cent. of the capital invested in railways in the United States has been spent in paralleling existing roads. But the total capital invested in the railways of the United States is about \$9,200,000,000; 5 per cent. of which is \$460,000,000. It is also to be remembered that this 7500 miles of needless road has to be maintained and operated at an average expense per mile per annum of \$4381, or a total annual cost of nearly \$33,000,000. Taking Professor Ely's estimate of \$1000 as the cost at which an average-sized family can be provided with a comfortable home, and we find that the cost of these unneeded railways would have provided 450,000 homes, sufficient to accommodate 2,300,000 people. Say that 3 per cent. of the cost of these homes is required annually to keep them in repair; then this could be furnished by the \$33,000,000 now paid for the operating expenses of needless railways, and an annual margin of about \$19,000,000 would be left, or enough to provide each year homes for nearly 100,000 more people in addition. Of course, this is merely a concrete example of what possible benefits we have been deprived by wasting our money in building needless railways.

"As a matter of fact, the money we have spent on unprofitable railways, as well as those totally useless, has wrought us an amount of damage far in excess of their actual cost. It is generally agreed by financiers that the periods of industrial depression during the past score of years have been largely due to excessive railway-building; for, in a period of active railway construction, roads are built whose only excuse for existence is that they will encroach upon the territory of some rival."

Akin to this problem is the question of railway pools and railway discriminations. The history of the early railway pools has been referred to above. Latterly the law has endeavored to prevent pooling, and popular prejudice has been strong against it.

The fifth section of the Interstate Commerce Act attempts to perpetuate competition by making it illegal for any carrier operating over a rail or rail-and-water route to enter into any combination or agreement with other carriers for the pooling of freights or the division of all or any portion of the gross or net earnings from competitive traffic.

The law has been occasionally evaded but has generally been observed, perhaps because it has seemed impossible to bind the roads to any published rates. This year, however, the Joint Traffic Association, composed of 32 great railroad systems, has effected an agreement, and Judge H. H. Wheeler of the Circuit Court Southern District Court of New York, has ruled that it does not violate any Federal statute. Appeal will probably be taken to the Supreme Court, and it is uncertain how the case will come out. But it is by no means clear that pooling is against the public interest.

**Railway
Pools.**

The New York *Tribune* quotes Chauncey M. Depew on the decision, in part as follows :

"This is the best agreement for the people, the railroads, the business men, and every one in general that has ever been effected. It helps the Interstate Commerce Commission, if they would only see it.

"Under the old system of cutting rates, the traffic was distributed unequally, and transportation facilities were disorganized. When the railroad presidents of this country took hold of the matter last summer they found the country demoralized as far as transportation was concerned, and everything in a chaotic condition. The cutting of rates was such that a small shipper could not get the benefit of lower rates, but it was the heavy shipper, who shipped great quantities, that could demand and get a lower rate. The railroads suffered, the people suffered, and the whole tendency was to build up great trusts and tear down the small dealer. By this cut rate the heavy shipper could undersell the man with a small capital and a small business. The producer was also in a bad plight. He could go but to one market—that of the trust—and get only what they chose to pay, and the trust in turn could sell for what they wished. It was ruinous to the small but honest dealer, and bad for the producer, and in turn it was centralizing the capital and trade. While the trusts do not control the Interstate Commerce Commission, yet it was the trusts that were indirectly behind this attempt to tear down the agreement. It is a good thing all around that the agreement stands. It gives the railroads a fair and equitable toll for carrying freight; it gives the man with a small business and a small capital the same chance that any great organization has; it gives the producer the chance to sell his goods at a price buoyed up by legitimate competition, and keeps things normal. The conditions are ironclad and will stand. It is far and away the best thing for the country, as far as transportation goes, that the country has ever seen."

Mr. H. T. Newcomb in the *Political Science Quarterly* for June, 1896 (p. 203), says the insertion of the clause against pooling in the Interstate Commerce Act "is now generally considered to have been a serious mistake."

Nevertheless there is another side to railway pools. They may prevent discriminations and so put the small shipper on equality with the large, but usually, *as a matter of fact, they do not.* Says Mr. Hudson (*Railways and the Republic*, p. 221): "In practise the pool simply strengthens the arbitrary and unrestrained power of railway officials over part of their traffic, and thus facilitates all vital and injurious forms of discrimination. . . . It is their exemption from competition, too, which enables them to establish arbitrary and unjust differences between shippers whose traffic is extended and strengthened by the pool." He quotes the New York Court of Appeals as saying of a pool, "that the freighters and passengers would be ill-served just in proportion that carriers would be well paid." Competition is regarded by few to-day as a possible panacea for railway ills, but it does not follow that it is safe to trust the commerce of the country to a sovereign and irresponsible private railway pool.

Unjust discrimination, however, between shippers is a worse evil than railway pools. Says Mr. Hudson (*idem*, p. 38): "Discrimination between different localities or cities involves the daily exercise by railway officials who adjust freight tariffs of a power greater than that possessed by any civilized government, except, perhaps, that of Russia." Mr. Hudson instances rates against cities that made it

cheaper at one time for merchants of Pittsburg, in shipping freight to Texas or California, to ship it first to New York and then to the West. Butter, he says, was at one time charged 65 or 75 cents per tub from a point 165 miles from New York, and 30 cents from Elgin, Ill., 1000 miles away. Special rates to favored shippers is even a grosser evil.

Says Mr. H. T. Newcomb (*Political Science Quarterly*, June, 1896, p. 209):

"Prior to the enactment of the Interstate Commerce Law so common was the practise of granting special rates to particular shippers that instances in which full published rates were charged have been declared by a high authority to have been the exception rather than the rule. Where the traffic was of great importance and the competition between rival roads exceptionally strenuous, each railway has been known to select a particular shipper, with whom arrangements for reciprocal favors were made. By means of such an arrangement a single firm was able practically to control for a considerable period all shipments of corn over a great trunk railway and to one of the principal ports from which that cereal is forwarded to foreign countries. The number of discriminations of this kind is known to have been materially reduced in consequence of the operation of the Interstate Commerce Law. They continue, however, to be one of the most effective weapons in competition for traffic between particular points, and will be an important factor in the railway situation as long as competition is a controlling element in rate-making. It is not even certain that they are not more harmful now than when more common; and it may be found that their baneful effects are accentuated by the fact that instead of being made, as formerly, for nearly every applicant, concessions from established rates are now granted only to powerful traders who are able to control vast shipments, and to traffic that yields a revenue that is of almost vital importance to the carrying companies. That such discriminations were a principal factor in the development of the petroleum monopoly, is generally understood. How far other great monopolies, such as those controlling beef and pork products and the sugar supply, have been so favored, is problematic, tho their ability successfully to demand such aid is undoubted. . . .

"The whole region south of the Potomac and Ohio, and east of the Mississippi, has continuously suffered from discriminations of this kind, through the system of making charges to a few selected cities the basis for through rates to all other points. Through rates are made to and from about two hundred of the larger towns, including Atlanta, Birmingham, Chattanooga, Meridian, Vicksburg, New Orleans, and Mobile, and traffic shipped from or to all other points is charged the rate to one of these basing points plus the local rate from such basing point to final destination."

Says the Hon. Thomas M. Cooley, formerly chairman of the Interstate Commerce Commission :

"When the number of railroads which are now merely subsidiary to other and stronger lines, either through being brought into the same interest or from being leased or otherwise effectually controlled, are left out of account, there are something like five hundred in this country still remaining whose boards have the power to make rates for the carriage of passengers and property. These boards are by the law left to exercise in the first instance what is practically a free and unlimited authority in the making of rate sheets. They may make them high or low, just or unreasonably discriminating as between persons and property, or different classes of property, or between different centers of trade, at pleasure. . . . It was at first thought by those who made the laws for the building and management of roads that to leave the authority thus unrestricted was the best possible condition of things; that it would lead to active competition in rates, of which the general public would have the benefit; that the competition would, as a matter of course, force the rates down to a reasonable point; in short, that the competition would act precisely as it does in other lines of business. Experience has shown that this idea of railroad competition is a mistaken one; that it cannot be

Railway Discriminations.

compared with competition in the channels of commerce in general; that there are no such tests of the value of railroad service as can fix the limit down to which a road may go without inevitable loss upon its business as an aggregate; that it may carry some classes of its business at impolitic if not in fact at losing rates, and yet make profits upon its whole operations by charging to other classes of its business rates which may perhaps seem excessive and yet cannot clearly be shown to be so because of the absolute impossibility of making distinct apportionment between the cost of service rendered to one class and that rendered to the other. . . . But so inextricably are the railroads of the country intermingled in interest; in so many ways do they form routes from business center to business center, from the Lakes to the Gulf and from ocean to ocean; so easy is it for almost any seemingly unimportant road to be made a part of some direct or indirect route which shall constitute a great channel of commerce, that any considerable change in the rate sheets by any one of these 500 boards is not only likely to affect the business and the rate sheets of the roads which are its immediate rivals, but to reach out also in its influence from road to road in all directions, not over small neighborhoods, but from State to State, until what seemed to be the action, and was, perhaps, the hasty and reckless action of a mere local board may become almost of continental importance. . . . This then is the railroad problem." (Address to Third Annual Convention of Railroad Commissioners.)

It should be remembered, however, that railroads can often afford to carry a commodity from a large center at half the price for carrying the same commodity a far less distance from a smaller place. From the center cars are going continually, and a commodity can be carried on a train, and perhaps in a car that would have to be hauled in any case. To carry the commodity from the small place means, perhaps, an extra car; perhaps, even an extra train. It may be, too, that empty cars have to be returned to certain central points, and can carry goods back in them at scarcely any extra cost. This rarely happens in small places. Similarly, railroads can afford to carry large orders at cheaper rates than small orders. Discrimination against small shippers and small places is thus often natural, and in this sense just. Competition *must* favor the large shipper and the central point. The question of railway discriminations, then, is more complex than it at first seems.

Some railway men even claim that the real railway problem is how to earn anything at all. Such men say that the great trouble with the railroad business is the hostility of the public in trying to tax them more than the business will allow, and in seeking through legislation to prevent combinations and pools, with the result that competitive rates drive them into bankruptcy or fraudulent understandings and arrangements. Says Mr. T. B. Blackstone, president of the Chicago and Alton Railroad, one of the more conservative roads, in his Thirty-second Annual Report (February, 1895, pp. 10-11):

"It is now from 30 to 40 years since a majority of the railroads of this country were constructed by, and at the expense of corporations, to whom the several States had, by a covenant in their respective charters, or by general laws, granted the right to charge and collect reasonable rates for transportation, and it is about 25 years since such States, especially in the West, inaugurated the policy of reducing railway rates by the instrumentality of parallel and competing lines, for which there is not now, and has never been, a public necessity.

"The several States, by reason of having authorized the construction of such lines, are morally responsible for conditions which have caused reasonable rates to be unattainable.

"Many laws have been enacted by State legislatures and by Congress during the last-named period, which provide for rules, regulations, and reduced rates, under which, in combination with the subdivision of traffic which has naturally been caused by the construction of the parallel and competing roads, above referred to, a large majority of Western roads have been forced to bankruptcy. . . .

"As to about three-fourths of the railroads in the United States, no comparison can be made between the amount of taxes and earnings available for dividends, for the reason that there are no such earnings.

"From the statistics published by the Interstate Commerce Commission for the year ending June 30, 1893, it appears that the owners of railroad stocks, to the amount of more than two thousand eight hundred and fifty-nine millions of dollars (\$2,859,334,572), or 61.7% per cent. of all such stocks, received no dividends, and that the owners of more than four hundred and ninety-two millions of dollars (\$492,276,999), or 10.7% per cent. of all railroad bonds, received no interest in that year.

"We learn from the same source that taxes amounting to \$36,514,689 were paid by railroad companies, which sum is equal to 36.1% per cent. of the amount of all dividends paid to railroad shareholders in that year, which was a year of at least an average volume of business in all parts of the country."

The report of the Commission of December, 1895, shows the number of roads in the hands of receivers. It says:

"Never in the history of transportation in the United States has such a large percentage of railway mileage been under the control of receiverships as on June 30, 1894. There were on that date 192 railways in the hands of receivers, of which 126 had been consigned to receiverships during the previous 12 months, and 35 during the year ending June 30, 1893. These 192 roads may be classified as follows: Thirty-one were roads operating over 300 miles of line; 37 were roads operating from 100 to 300 miles of line; 69 were roads of less than 100 miles in length; 4 were roads not in operation, and the remaining 51 were subsidiary roads, parts of systems. The mileage of line operated by these defaulting companies was 49,818.81 miles. Seventy-eight per cent. of this mileage is accounted for by the 31 important lines, each operating over 300 miles of line. The total capitalization of roads in the hands of receivers was about \$2,500,000,000; that is to say, one-fourth of the total railway capitalization of the country. This, as a record of insolvency, is without a parallel in the previous history of American railways, except it be in the period from 1838 to 1842. It is undoubtedly a result of the general business depression through which the country is passing."

There is, however, another side to this. In the *Banker's Magazine* appears an article on *Railroads in Default*, in which the writer, presumably the editor, seeks to correct the impression current throughout this country and Europe that a large proportion, not less than one-third, of the railroads of the United States are in default on their bonds. The writer furnishes figures to show that this impression is erroneous, and that the number of separate companies in default is 109 out of 679, being thus only 16 per cent. of the steam railroads in the country, while the total amount of bonds now in default is about \$976,000,000, out of some \$5,600,000,000 railroad bonds outstanding in 1894, or less than 17½ per cent. of the whole.

The following table gives a summary of the number of roads classified territorially and the amount of bonds in default.

It will be seen that the main roads in default are lesser roads in the South and West, while the large amount of bonds in default are the Pacific roads.

	NUMBER OF ROADS.	AMOUNT OF BONDS.
New England States.....	1	\$15,000,000
Middle States.....	8	92,529,400
Middle Western and Western States.....	32	100,921,200
Southern States.....	39	129,385,175
Southwestern States.....	7	29,907,000
Pacific Railroads.....	17	579,765,000
Pacific States.....	5	28,515,000
Grand Total.....	109	\$976,022,865

Says the writer :

"On June 30, 1894, the report of the Interstate Commerce Commissioners gave the railroads in receivers' hands at 156, of which 106 had failed during 1893-94 and 28 during the year ending June 30, 1893. The mileage operated by these defaulting companies was 38,860, of which 80 per cent. was operated by 28 companies.

"In such times of panic and depression as this country has passed through during the past two years there is an unfortunate tendency to exaggerate evils, and to overstate figures purporting to represent the extent of the troubles, especially in those branches of business where there are no government figures, nor any other statistics kept up with a reasonable degree of accuracy. It may, therefore, be somewhat reassuring to investors to know that only about 18 per cent. of the United States railroad bonds are now failing to yield promptly their interest as it falls due, and even this overstates the case, for the interest on quite a number of bonds embraced in the table above is paid a few months after it becomes due, and the default in each instance is only temporary."

All the facts contradict the "poverty" talk of the roads, Van Oss' *American Railroads as Investments* says upon this point (pp. 138 and 139):

"The mere fact that American railroad bonds pay an average of 4.36 per cent. suffices to show that water is not detrimental to the investor of to-day. These bonds represent no par investment; the average price at which they reached the first investor did not exceed 67, no matter what somebody who buys them to-day must give for them. Hence American bonds now actually return an average of 6.50 upon the real investment. . . . The above relates only to bonds, but we will show that the same conclusion must be arrived at concerning shares. Shares, according to *Poor's Manual*, now pay 1.80 per cent. on the average—apparently no high figure. . . . But for \$4,650,000,000 shares now in existence, the original investors certainly paid not more than \$465,000,000, or 10 per cent. of their face value, and probably less. Hence shares now return at least 18 per cent. per annum upon the actual investment."

The italics are not ours. Mr. Van Oss writes, not as a Western anti-monopolist, but as an English investigator who approves of the methods by which American railroads conceal their profits from the general public.

When railroads fail it is usually because of speculation, the bulling and bearing of railroad stock, financial railroad-wrecking, or the depreciating of stock in order to buy it up, etc., etc. Says Professor R. T. Ely (*The Independent*, August 28, 1890):

"Private railways are to be condemned because they have been so managed that they have defrauded thousands upon thousands of their property. Bankruptcies of railway corporations are an every-day occurrence; and there is not a town of any size in the United States where you cannot find people whose hard-earned savings have been swallowed by rail-ways; often the widow and orphan are sufferers. From 1876 to 1889 nearly 450 railroads in the United States were sold under foreclosure. When one person has suffered from dishonest or inefficient government

management of finances, 100 have suffered from dishonest or inefficient management of railways.

"American railways have frequently been managed by those who wished to bankrupt them for one purpose or another. I have a concrete instance in mind. A railway was recently, as was brought out by certain business transactions, purposely losing something like a thousand dollars a day to bankrupt it. It is often desired to bankrupt a railway to buy it in cheap and to 'freeze out' certain interests. Sometimes towns, cities, and States contribute to the expense of railway construction and take stock; now if the company becomes bankrupt and is sold at auction to the bondholders for the amount of the bonds, the stockholder is 'frozen out' and has lost his entire investment. Some farmers not long ago took stock for the land they sold to a railway company, and in the foreclosure proceedings all stockholders were 'frozen out.' It was considered a good joke!"

We have not, however, exhausted all the problems of the railway. Thus far we have been considering the relations of the railroads to the public. There is, however, the question of the relation of the railway to its employees. United States railroads have won, in the first place, an unsavory reputation for murdering their employees. If this seems a strong phrase, it is unfortunately justified by the facts. For proof of this, see RAILWAY ACCIDENTS. Next to the question of the lives of employees comes that of the wages of employees.

Wages of railroad employees in the United States are higher than those in Europe, but not so much higher as is sometimes thought, and not so much higher as first appears. According to the Report of the Interstate Commerce Commission for 1894, the wages of engineers in the United States were \$3.61 per day; of conductors, \$3.04; of firemen, \$2.03; of switchmen, flagmen, and watchmen, \$1.75. The Report of the United States Commissioner of Labor for 1889, comparing English and United States wages, says the English engineer receives only from \$1.34 to \$1.95 per day, and the fireman only from 85 cents to \$1.10 per day. This is certainly lower, and yet deceptive. According to the commissioner's report itself, by no means all employees on American roads have work all the year. Fifty-eight and eight-tenths per cent. of them, it says, were employed less than half the year. For the 58.8 per cent. of employees, therefore, this would reduce their wages more than one-half, or below the English rates, and reduce the wages of all considerably. Doubtless English wages would have to be somewhat similarly reduced, but by no means to the same extent. On some English roads, if an engineer is not given 60 hours' work a week, he can complain to the foreman. The amount of employment is often a more serious question to a wage-earner than his rate of wage. Other questions, too, come in—as to general treatment, etc. Most of the great railroad strikes of the United States have turned on other questions than the rate of wages.

Wages.

In the United States, in 1894, wages were slightly lowered, and many employees discharged, because of the hard times, yet, at the very same time, the salaries of the general officers were raised. *The Statistics of Railways in the United States for 1894* (p. 37), published by the Interstate Commerce Commission, gives the facts as follows :

AVERAGE DAILY WAGES.

	1892.	1894.
General officers.....	\$7.62	\$9.71
General office clerks.....	2.20	2.34
Station agents.....	1.81	1.75
Conductors.....	3.07	3.04
Engineers.....	3.68	3.61
Firemen.....	2.07	2.03
Laborers.....	1.67	1.65

In France, according to a United States consular report, dated May 31, 1894, engineers, on the Paris, Lyons, and Mediterranean road, as a sample road, receive from \$33 to \$50 per month; firemen, from \$23 to \$28; switchmen, \$21.75, but besides this the company maintains a pension fund, to which the men contribute somewhat, but the company considerably more. English railways have had relief departments for their employees since 1850. In the United States the Baltimore and Ohio road organized such a relief organization in 1880. It was compulsory upon its employees, like the Canadian and European relief departments. Since then the Pennsylvania, Reading, and Burlington roads have organized relief departments, while the Northern Pacific and Lehigh Valley, and some lesser roads, have relief funds. The general principle is of a fund contributed to by both employees and the roads, from which sick, accident, and death benefits are paid. The four great railways having relief departments operate one-eighth of the total railroad mileage of the country, and their departments include 92,275 men, somewhat over one-tenth of the employees of the country. Some of the roads also maintain physicians, hospitals, etc., for their men. By the railway employees' organizations these railway relief departments are usually opposed, as tending to make the employees too dependent on the railroads, and preventing independent unions, which can agitate for higher wages or shorter hours.

In no country are the wages suited to the long hours often required. The mental strain of long hours of duty, where men are kept continually on the road, with little or no opportunity to rest, and the irregular hours for sleep and rest, even under the most favorable conditions, makes the life of a railway employee a hard one.

Nevertheless, in realizing these evils, the reader should not forget the good that railroads have accomplished, and, above all, the good accomplished by the great through roads. Without them modern commerce would be impossible. They have developed cities; opened up large tracts of territory; turned deserts into gardens. They bind together States and countries. They unite friends, and are the arteries of public life.

Mr. Atkinson calls Mr. Cornelius Vanderbilt a communist, because of his service to the public, and says of American railroads:

"They have reduced the cost of moving a barrel of flour a thousand miles to so small a sum that it can hardly be measured in a loaf of bread, at a margin of profit which is less than the value of the empty barrel at the end of the line."

And again:

"The commerce of the world now turns from one side of the globe to the other on a margin of a cent on a bushel of grain, a dollar a ton of metal, a quarter of a cent on a textile fabric, or the sixteenth of a cent a pound on sugar. A cube of coal which would pass through the rim of a quarter of a dollar will drive a ton of food two miles on its way from the producer to the consumer."

Benefits to Commerce.

Yet in realizing what American railroads have done, it must not be fancied that they lead the world in public service. American freight rates are lower than those of Europe, but passenger fares are cheaper in Europe, especially on the State-owned roads. Mr. W. M. Acworth of England, comparing English and American Railways (Paper 16, in *Compendium of Transportation Theories*), puts the average third-class railway fare in England, which is used by the overwhelming majority of English travelers, and which he considers fully as comfortable as the average American car, at 1.8 cents per mile, compared with the American average of over two cents. On the other hand, the extra price for Pullman cars in America he considers considerably lower than the difference between first and third class fares in England. Professor Hadley gives in *Johnson's Cyclopaedia*, the following average rates for 1887.

COUNTRY.	PASSENGER : CENTS PER MILE.	FREIGHT : PER TON PER MILE.
United States.....	2.16	.94
Great Britain.....	about 2	less than 2
France.....	1.30	1.77
Prussia.....	1.22	1.43
Austria.....	1.54	1.85
India.....	.54	1.36

But the average American haul is 127 miles, and the English under 25; so that terminal expenses per ton-mile enter five times as much into the English rate as the American. Besides, a large proportion of English rates include cartage and delivery, even of rough goods, which in New York cost a dollar or two per ton. Again, English rates are essentially retail, at high speed and frequent intervals. American rates are essentially wholesale, at such speed and intervals as suit the railways.

Fares and Freight Rates.

According to United States Consular reports dated in 1894, railway fares in France also are cheaper than in America, and freight rates higher. Fares are, first class, 3.6 cents per mile; second class, 2.6, and third class, 1.6. Goods weighing under 88 lbs. are charged 8.5 cents per ton per mile; up to 6614 lbs., 13.6 cents; up to 40,492 lbs., 27 cents. Coal, timber for building purposes, are charged 2.03 cents per ton per mile.

In Germany, fares on the Prussian state roads are 3.09 cents per mile (first-class); 2.01 (second class); 1.29 (third class); 1.08 (fourth class); wheat and flour cost for 1000 kilometers (621 miles), \$10.99 per ton; iron plates, machinery, etc., \$8.61; pig-iron and coal, \$5.52.

For one kilometer, they all cost 20 cents, varying in proportion to the distance. Fares on Belgium's state roads, according to Professor Hadley, are the lowest in the world, save those in India. Since Professor Hadley's book Hungary's state zone system has lowered rates there to a marked degree.

As for the speed of trains, America probably runs a few of the fastest trains in the world. Nevertheless, one or two English trains occasionally run faster, and the average express trains in England, with their fine road-beds and lack of grade crossings, exceed the speed of American expresses.

Speed.

According to Mr. Theodore Voorhees, General Superintendent of the New York Central and Hudson River Railroad (Paper 17, *Compendium of Transportation Theories*), that road has one train (the Empire State Express) which covers 440 miles at 52 miles an hour, but the average express between New York and Chicago, Boston, etc., makes about 41 miles per hour, while England has many trains at over 50 miles per hour. On the Continent few trains make 40 miles per hour, while 30 is nearer the express average.

The following table gives the comparative railway mileage of different countries :

	MILES OF RAILROAD.	MILES PER 1000 INHABS.
America.....	225,582	
Europe.....	148,230	
Asia.....	24,102	
Australasia.....	13,067	
Africa.....	7,695	
Total.....	418,676	
United States.....	178,709	26.7
Germany.....	27,863	5.5
France.....	24,455	6.4
Russia and Finland...	20,785	2.1
Great Britain and Ireland	20,641	5.3
British India.....	18,268	0.6
Austria Hungary.....	18,119	4.2
British North America...	15,768	31.1
The Argentine.....	8,357	19.3
Victoria.....	2,974	25.4
New South Wales.....	2,564	20.8
Queensland.....	2,379	55.1
New Zealand.....	2,101	31.3
South Australia.....	1,822	52.5

IV. RAILWAY REFORMS.

The ways in which it is proposed to meet the above problems are very diverse. Some argue for the maintenance of the present system, with more and wiser public control ; others, for a nationalization of the road-beds of railways, with private operation ; still others for complete nationalization.

A. IMPROVED PRIVATE MANAGEMENT.

The report of the Interstate Commerce Commission for 1895 says (p. 15) :

"The tendency toward railway federation is very marked, and indicates a future combination of carriers wielding such extraordinary power as to constitute, in the estimation of many people, a serious menace to commercial freedom. That power will be deprived of its principal danger if the authority of the State to prevent excesses and inequalities finds ample expression in enforceable methods for fixing the standard of charges. The business in which railway carriers are

engaged is a public service of universal and constant necessity, and public authority is bound to see that the terms upon which that service is rendered are not burdensome or unequal. This implies vastly more than enforcing conformity to the published tariff and the prevention of discriminations between persons entitled to like treatment ; it involves the determination of what the tariff shall be, due regard being had to the rights of shippers and carriers alike."

But see p. 131.

"The Commission is not to be understood as advocating at this time an enlargement of the general scope of the act, or as asking any radical change in its general structure. Those who have given most reflection to the subject of government regulation are aware that the laws now in force are more or less tentative and experimental, and such persons anticipate that the evolution of railway control by public agencies will sooner or later result in a more comprehensive and direct exercise of the power possessed by Congress to regulate our internal commerce. But the time has probably not arrived for new departures in this field of legislation, and the Commission is careful to confine its recommendations within the limits and aims of the original enactment. The distinct object, therefore, of the amendments now urged upon your attention is to give to the statute the degree of completeness and effectiveness which it was designed to have, and to provide the means whereby its purposes can be fairly accomplished. It certainly cannot be believed that Congress, having once assumed to exercise a measure of control over railway carriers, will allow that control to become ineffectual by withholding the legislation found necessary to secure the results expected. We desire to make it specially plain that the amendments asked for at this time are intended simply to make the substance of the law mean what it was supposed to mean at the time of its passage. Experience has demonstrated the respects in which the statute is inadequate, and that demonstration discloses, we submit, the duty of Congress to correct its proven deficiencies. If the policy of regulating railroads by public authority is to be permanently continued, it is obvious that laws should be provided to make that regulation efficient and useful."

The objections to this plan, however, are numerous, but mainly based on the impossibility of controlling private railroads. Says the Hon. Thomas V. Cator in a tract on railroads :

"How then can the public control them without owning them? It is idle to say you will favor ownership by the Government if control fails, because every effort to control them has, and of necessity must, fail, until the people own and operate them. How can you expect to join such inconsistent things as private ownership and public control? The right to control, to fix rates, is the very essence of property and of ownership. He who cannot control does not in fact own property. If we seek, by boards, commissions, legislatures, congresses, or courts, to frame methods and sources to control railroads, the inevitable law of self-interest will immediately induce the owner to own also these boards of control, by which, as we have seen, all such commissions, legislatures, congresses, and courts are elected, packed, owned by that monopoly."

Objections.

Mr. C. W. Davis says in *The Arena* for August, 1891 :

"The president of the Union Pacific tells us that 'The courts are open to redress all real grievances of the citizen.'

"There is probably no man in the United States better aware than is Sidney Dillon that no citizen, unless he has as much wealth as the president of the Union Pacific, can successfully contest a case of any importance in the courts with one of these corporations which make a business, as a warning to other possible plaintiffs, of wearing out the unfortunate plaintiff with the law's costly delays ; and, failing this, do not hesitate to spirit away the plaintiff's witnesses, and to pack and buy juries—retaining a special class of attorneys for this work—the command of great corporate revenues enabling them to accomplish their ends, and to utterly ruin nearly every man having the hardihood to seek Mr. Dillon's lauded legal redress, and when they have accomplished such nefarious object, the

entire cost is charged back to the public and collected in the form of tolls upon traffic."

"Referring to traffic associations, and their vain endeavors to keep the corporations within sight of commercial ethics, the Interstate Commerce Commission says: 'But the most important provisions of the law have not so often been directly violated as they have been nullified through devices, carefully framed with legal assistance—here is one of the places where the high-priced lawyer gets in his work—with a view to this very end, and in the belief that when brought to legal test the device hit upon would not be held by the courts to be so distinctly opposed to the terms of the law as to be criminally punishable.'"

There is also serious reason to doubt whether the courts will to-day allow the Government to fix rates. Says Mr. Cator in the tract quoted above:

"The courts have emphatically decided that neither Congress nor the States, by legislation or commission, can provide for or put into operation any schedules of rates or tolls to bind a railway which cannot be restrained by injunction, and declared void either by a State or United States court, if, upon hearing, such court deems it unreasonable. The courts say that if the schedules fixed by the power of law are not, in the opinion of the court, reasonable, then it amounts to a taking of private property for public use without just compensation, and is forbidden by the Constitution of the United States. This has been decided by the Supreme Court of the United States in the case of *Stone vs. The Farmers' Company*, 116 U. S. Rep., p. 307, and in *Dow vs. Beidleman*, 125 U. S. Rep., p. 680; also in United States Circuit Court, in 35 Fed. Rep. 880-886; also by decisions of the courts of last resort of many States, which are quoted in the late case of *Water Works vs. San Francisco*, 82 Cal. Rep., p. 286, where it was held that even where the constitution empowered a board to fix rates absolutely, it could be restrained by the court if it thought other and higher rates proper.

"The final absolute decision of our courts, therefore, is that the power to fix rates is in the courts, and cannot be placed elsewhere. What, then, is the rule adopted by the courts? It is this: That the rates must pay—first, the interest on the railway debts; second, all its operating expenses; and third, a fair dividend on its capital stock as fixed or increased; fourth, the expenses of operation shown by the books of the company—because no one is in a position to disprove these books, even if falsely kept, as to operating accounts.

"This amounts therefore to allowing the company to fix its own rates, despite and in defiance of any attempt to regulate. So if the Farmers' Alliance were in possession of every branch of government in States and nation, it would be helpless to regulate or control railways. Every law or schedule would be immediately stayed by the injunction of a court.

"This was done when Judge Brewer, by injunction, forbade the State of Iowa to put its schedule of rates into operation, at the suit of the Chicago and Northwestern Railway Company. It was done when the Supreme Court of California prohibited the city of San Francisco from putting its schedule of water rates into operation—and that such is to be the course, wherever control is attempted, is squarely asserted by C. P. Huntington in an interview published in the *Examiner* at San Francisco on April 4, 1892. When he was asked what would be done if any political action should be taken by the Merchants' Traffic Association to compel a reduction of rates, his answer was as follows: 'I will say that the association may or may not draw the company into politics. I think not; but if the legislature of the State passes acts tending to destroy the value of our property, we shall have to call for protection upon the judicial arm of the Government.'

"This proves that henceforth the above doctrine established by the courts is to be the shield of monopolies. They can increase stock and bonds at pleasure, so that no income would be so large but that they could show that it was required to pay interest, operating expenses, and dividends. They have the Supreme Court of the United States committed to this doctrine."

B. NATIONALIZED ROAD-BEDS.

It is proposed that competition be attempted in another form; that the nation own the roads, and, under proper conditions, allow

competing parties to run cars upon them, treating our railroads exactly as highways. The best plan for this has been presented by James H. Hudson in his *The Railways and the Republic*. He says in substance:

"Under this plan the trains may be owned, loaded, and forwarded by different carriers, but all trains would be under the control of a train dispatcher. The carrier wishing to run a train of his own could be required to run a regular train on schedule time, or to follow a regular train with an extra, just as extra trains are now run on every road in the country.

"With the right of all carriers to transport freight over any railroad fully recognized, it might be permissible to leave the movement of trains in the control of the railroad corporation. The company might be allowed to inspect the rolling stock sent over its road, and to exclude all rolling stock that did not meet the requirements of safety and dispatch.

"Even a small capital could compete on fair terms with the greatest. An engineer and a conductor, being qualified and licensed, could buy a locomotive, and engage in the business of hauling loaded cars belonging to one or a dozen shippers. Repeatedly, even now, more than one railroad company have used a track jointly for a term of years.

"The question of tolls under this plan of free competition presents but little practical difficulty. The toll should be a reasonable and uniform rate per ton per mile for freight, and per car per mile for empty cars; such as will, in the aggregate, yield revenue enough to repair and maintain the track, to pay fixed charges, and leave a fair dividend upon the *bona fide* capital invested.

"If any one carrier, or all the carriers, were to grant special rates and train accommodations to certain shippers, the shippers discriminated against could, by investing a few thousand dollars, secure the carriage of their freight at nearly first cost. Any community discriminated against by the projectors of a railroad could construct a short line of its own to the discriminating railroad, and freely use the tracks of the latter. Whatever differences of rates arise, under the natural and legitimate conditions of transportation, would remain under free competition. Whatever differences are produced by the monopoly of the railroads as carriers would be abolished."

The objections to this plan are many. It would produce most of the evils of the complete national ownerships of roads, without many of its advantages. If the nation owned and managed the road-beds, and controlled the running of the trains, as it would have to, in order to secure safety, it would have in its employ, and under its control, vast numbers of men, where all the evils of political corruption could creep in, and yet not owning the rolling stock, and allowing any one to run trains, it would have only a partial responsibility; that is, less power to prevent corruption. It is hard to imagine conditions more favorable to corruption. Divided responsibility is invariably the corruptor's opportunity. Again, it would hardly be possible, under this system, to prevent the combination that produces the evils of to-day. Large companies could own large quantities of rolling stock, and could easily, in a hundred ways, drive out small competitors. If competition could be easily and cheaply commenced, it could also be easily and cheaply bought up. In the very nature of the case, to secure safety, speed, and economy, there would have to be such an agreement as to the dispatching of trains as to make combination almost a necessity. Other difficulties could be mentioned.

C. RAILWAY NATIONALIZATION.

A growing number of persons favor complete railroad nationalization. This is favored

by socialists, but it is not necessarily socialist. (See SOCIALISM.) Says Professor Ely (*The Independent*, August 28, 1890) :

"Government ownership of railways must be regarded as a part of a general scheme for public ownership of all monopolies. It is in the direction of individual liberty, and does not lead to socialism. It may be regarded even as anti-socialistic. It has shown no tendency to promote socialism where it has been tried. It is, to be sure, a part of the scheme of socialists, but it is likewise desired by many anti-socialists. It does not of necessity mean centralization of power, but it is compatible with an extension of the sphere of States and local political units."

There are many arguments in favor of nationalizing railroads. First, it would be cheaper. Professor Frank Parsons says in the *American Fabian* for February, 1896 :

"The cheap transportation of persons and products is of the utmost importance to every people. It means an increase of travel and traffic, which adds to intelligence, sympathy, freedom, strength, safety, and wealth.

"Traffic increases in geometric ratio with the reduction of rates. Public enterprise serves the people at cost, reducing the rates to the lowest practicable figure, while private enterprise keeps prices up to the highest practicable limit.

"If the postal service had been left in private hands we probably would still be obliged to pay 25 cents on a letter or book, as we do to the private express companies, no matter how small the package. If, on the other hand, the business of the railroads had been turned over to the nation, freight rates and passenger rates would have been reduced from time to time, as the postal rates have been, and we would now be enabled to ride at a cost of one-tenth of a cent a mile, or less, and send our freight at one-half a cent per ton per mile. With the increase of traffic which is sure to follow low rates, it is probable that the cost of transportation would fall even lower than this.

"Trains have been run in this country at even a lower cost than one-tenth of a cent a passenger mile.

"If the nation owned the railways we could go from New York to San Francisco and return, for a five-dollar bill. These things would be possible, because of the great economies that would be effected by public ownership—economies that would save the people more than half of what they pay for railway service and reduce the actual cost of operation by at least a third. Here are the items :

Savings.	In Millions.	Authority.
By abolishing all but one of the presidents with their staffs.....	25	C. Wood Davis.
By abolishing the high-priced managers and their staffs.....	4	" "
By abolishing attorneys and legal expenses...	12	" "
By abolishing competitive advertising.....	5	" "
By abolishing traffic associations employed to adjust matters between competing roads.....	4	" "
By exclusive use of the shortest routes.....	25	" "
By consolidation of working depots, offices, and staffs.....	20	" "
By uniformity of rail cars, machinery, etc., cheapening their manufacture, etc.....	5	Parsons.
By avoiding strikes and developing a better spirit among employees.....	10	" "
By abolishing railway corruption funds.....	30	Thomas V. Cater.
By having no rent or interest to pay.....	300	Poor's Manual.
By having no dividends to pay.....	90	" "
By putting the surplus in the people's treasury..	20	" "

"Total savings by public ownership of railways, 661,000,000 a year—a saving of more than half the \$1,200,000,000 yearly paid to the railways by the people.

Second. Public safety demands public ownership of the railways.

Says Professor Parsons in the same article :

"It is seven times as dangerous to be a railroad employee in the United States as in Austro-Hungary, and eight times as dangerous to be a passenger in the United States as in Germany. It was less of a risk to your life to enlist in the Union armies during the Rebellion than to enlist in the railway train service of the United States to-day. One train man out of 12 is injured every year in the United States, and one out of 10 in the South. The managers are too anxious for dividends to care much about buying safety couplers or automatic brakes for freight cars, or even to provide for the safety of their crossings. The railway murders at the crossings in Chicago alone foot up to over 400 a year.

"A railway strike is a public calamity; paralysis playing about the heart of the nation. The great strike of '87, destroying millions of property and tying up hundreds of miles of road, opened the eyes of the people to some extent, but it took the Chicago strike to show our people the real quality of the institution. Since that, nine men out of ten I talk with are ready for public ownership. And no wonder: that strike cost the roads \$5,358,000, and the strikers \$1,730,000.

"The interests of employees are always better cared for in public employment than in private employment of similar nature. Eighty-five per cent. of all railway employees get less than \$2 a day. Baggage men average \$1.50, switchmen the same, flagmen \$1.13, and railway laborers \$1.24. On the other hand, Uncle Sam's mail carriers get \$600 the first year, \$800 the second, and \$1000 the third, and work but eight hours, while railway men work 10 to 14, and brakemen often 16 hours a day."

Third. Perhaps the main argument for nationalizing the railroads is that it would take out of industry the great combined interests that are to-day dominating commerce and threatening democratic institutions. Says the Interstate Commerce Commission Report for 1895 (p. 63): "Few persons appreciate the extent to which railway corporations are engaging in business outside the legitimate service of transportation." For further statements of how railroads control to-day the coal business, the oil business, the lumber trade; of how they own vast tracts of territory in the West, and are buying real estate in the East, see articles WEALTH; PLUTOCRACY; MONOPOLY; TRUSTS. Says E. P. Alexander in *Railway Practise*; "The great majority of the phenomenal fortunes of the day are the result of what may be called lucky gambling. . . . Wall Street is its headquarters, and millions upon millions of dollars are accumulated there to meet the wants of the players. Railroad stocks are its favorite cards to bet upon, for their valuation is liable to constant fluctuation on account of weather, crops, new combinations, wars, strikes, deaths, and legislation. They can also be easily affected by personal manipulations." (See PLUTOCRACY. For the extent to which they dominate and corrupt legislation, see the same article.) They own many legislators and some legislatures. They control Senators, are represented in the cabinet, and on the judicial bench. (For proof of all these statements, see PLUTOCRACY.) They laugh at the laws of States and the Interstate Commerce Commission confesses that it is powerless before them. (See INTERSTATE COMMERCE ACT.) The one supreme reason for nationalizing railroads, is that control without ownership

is impossible, so that, if the country does not own the roads, the roads will own the country.

Says Professor R. T. Ely (*The Independent*, August 28, 1890):

"No government railways in the world are so thoroughly in politics as the American private railways. You cannot turn in any direction in American politics without discovering the railway power. It is the power behind the throne. It is a correct popular instinct which designates the leading men in our railways, railway magnates, or kings. If not already the real rulers of the country, they are becoming so; and already in the industrial world they wield a power which the ordinary political king does not possess. It is no wonder that they look upon Government with a certain contempt; for have they not their agents in all departments of Government? The danger which is to be dreaded is that of all despotic power; and, out of all despotisms, that which finds its source in the control of indispensable economic resources is most dangerous. In other words, if the ascendancy of private railways becomes complete, it will be worse than the despotisms of history in several respects. It is more secret and insidious in its operations. Its power ramifies in every direction, its roots reaching counting-rooms, editorial sanctums, schools, and churches, which it supports with a part of its revenues, as well as courts and legislatures. It is not an open, avowed power, but an underhanded one, which unawares throws its coils about us. . . . It can safely be said that no department of our Federal Government could long be managed so dishonestly as our railways. Public management is necessarily open. It comes before the people; the minutest details are dragged into the light. Now people are afraid to say what they know about railways; but under ownership by Government there is always a powerful party, supported by a strong press, whose interest it is to search out every abuse and make it appear even worse than it is. Practices which may now be indulged in with impunity would then send a man to the penitentiary. There would not, under public management, be the same temptation to dishonesty.

"An elevation of the character of our civil service must inevitably result from government ownership of railways. Private employment would no longer offer all the great prizes to business talent. Probably nearly all the present able managers, who are in so many respects an admirable class of men, would remain in railway service, but they would then exercise their talents in the interest of the public, and not for private interests, and, after all, public service tends to enable character in a morally sound community. Public ownership would necessarily be the death of the spoils system in politics, for it could not live when its real significance would become so plain. All would see what the nature of the spoils system is. Where Government does most, as a matter of fact, we find the best civil service, the least interference of civil servants in elections, and the greatest individual liberty of civil servants. We may expect something like a military organization of the railway department of the public service, and that kind of organization is the one needed in railways. Private corporations seek it and desire it; but it is dangerous in their hands, and cannot be allowed, even if it would prevent strikes."

The result of the last national election could have been changed by a change of 21,000 votes in California, Oregon, North Dakota, West Virginia, and Indiana. (See *PRESIDENCY*.) That enough political influence in those States was cast by the railroads to secure those votes for Mr. McKinley, no one acquainted with the facts will deny. We do not refer of necessity to corrupt influence, but to the natural influence of vast corporations employing so many men. Railroads in the United States employ directly 800,000, and according to O. D. Ashley of the Wabash Railroad, railroads support and therefore have a controlling power over 1,200,000. The federal armies of the United States at the end of the war numbered only 1,000,516 men. Is it safer to trust such armies to the national government responsible to the people, or to

private corporations largely irresponsible? And railroad corporations kill. In the terrible battle of Gettysburg, 2834 Union men were killed and 13,713 wounded; in the year 1894, 2147 persons were killed by railroad accidents (1823 of these being employees, mainly brakemen) and 26,476 were injured. The main power of the railroads is, however, financial. Their capitalization, June 30, 1894, was \$10,796,473,813, or over six times the national debt. This enormous power is practically controlled by a few men controlling a few ruling corporations.

"In America," says the English writer Acworth, "the railway rate is a matter of life and death. In America rates vary from day to day as wildly as the price of fish at Billingsgate. An Oriental despot, a Baber, or an Aurungzebe did not make and unmake cities with more absolute and irresistible power than did an American railway king.

"We are told that the American railways have ruined the English farmer; people forget that they have ruined the American farmer also."

X Says Mr. Stickney:

"This power, like a government, has authority to make tariffs and to enforce their collection. It claims a right which no civilized government claims, and no sovereign has dared to exercise for centuries, of rebating a portion of its tariff, and thus discriminating between its subjects in the collection of its revenues. It is safe to say that if the Congress of the United States should enact a law which established on any commodity one impost duty for the city of New York and a different duty for other cities, or one duty for one firm and another duty for another firm, no matter how slight the difference, the people would resort to arms, if need be, rather than submit." (See A. B. Stickney's *Railway Problem*, page 31.)

Says Mr. Bryce:

"These railway kings are among the greatest men, perhaps I may say are the greatest men, in America. They have power, more power—that is, more opportunity to make their will prevail, than perhaps any one in political life, except the President or the Speaker, who, after all, hold theirs only for four years and two years, while the railroad monarch holds his for life. When the master of one of the great Western lines travels toward the Pacific in his palace car, his journey is like a royal progress. Governors of States and Territories bow before him; legislatures receive him in solemn session; cities and towns seek to propitiate him, for has he not the means of making or marring a city's fortunes?" (Bryce's *American Commonwealth*, 1st ed., vol. ii., page 515.)

Says Mr. J. L. Cowles (*A General Freight and Passenger Post*, p. 38):

"According to the *Railroad Gazette* of March 20, 1896, the New York, New Haven and Hartford Railroad now owns all Southern New England, with its fast-growing cities, as in fee simple. It has not only absorbed our principal lines of land transportation; it has also obtained nearly complete control of almost every important wharf in our chief New England harbors and of almost every competing steamboat line that plies along our coast. It has already seized more than one of the trolley lines which were built to secure to local travel a reasonable service, at reasonable rates, and a decree has gone forth from the railroad capital, in the city of New Haven, that not another electric tramway shall ever be laid down on any of the highways which the people of Connecticut have built and which the tracks of this road parallel. There is to be no avenue of escape from the burdensome taxes which this corporation sees fit to levy upon its subjects. Recent events would seem to indicate that even the church is not to be free from its encroachments.

"Henceforth the presiding council of this Imperial Railroad Government are to regulate all the conditions of life in New England. The wages of New England labor, the profits of New England business, are to be determined by their will. Her cities, towns and villages are to wither and dry up or to grow and flourish

at their pleasure. It will be of no avail for the factories of the interior to move to the seaboard, for this railroad despotism rules the sea as well as the land. It completely dominates the navigation of Long Island Sound, the great ship canal that bathes our southern border. A view taken from the top of Bunker Hill monument will show that almost every dock in Boston Harbor is in its control. From Eastport, Me., to New York City the tariff laws of this *de facto* consolidated government have infinitely more influence upon life and upon business than have the tariff laws of Congress.

"Notwithstanding the fact that the New York, New Haven and Hartford Railroad Company, with its comparatively level track and few curves, can haul the heaviest loads at the lowest cost of almost any road in the country, its average freight rate per mile is among the highest in the country. It is nearly double the average rate in the United States; it is more than double the average rate in the Middle States, in Ohio, Illinois, Indiana, and Michigan. . . .

"The passenger fares on the various lines of this consolidated road are, in most cases, nearly as high as they were in 1850, and in some cases consolidation has very much increased the fares."

These great corporations, too, are, as many believe, one of the great causes of the development of other trusts and monopolies. Says Albert J. Stickney in his *Railway Problem*:

"A railway manager finds it more convenient to deal with one man or one corporation than to deal with a number of individuals; the manager therefore commences operation by giving to some enterprising party an advantage over his neighbor in rates. The favored individual, of course, soon obtains a complete monopoly in his particular trade; it may be in the product of mines or of oil wells, of farms or of factories. After a time the grantees of these monopolies become rich, and instead of receiving rebates as a favor, they become masters of the railways, and, by playing one against another, they practically dictate the rates they pay."

Says Mr. Depew:

"They parcel the United States out among themselves, and they send their products by any railway they see fit. To-day they send it over the New York Central; to-morrow they arbitrarily change it to the Pennsylvania Railroad. One of these privileged dealers, for instance, is able to send 5 or 10 cars of first-class goods per day from Chicago to New York. The regular rate is 75 cents per 100, but in order to get his trade, the railways offer him a rate of 35 or 40 cents."

Says Mr. Cowles (as above, pp. 28-29):

"Taking a carload of first-class freight at 10 tons, this great firm, at a rate of 35 cents, receives an advantage over its competitors of \$30 per car, from \$400 to \$300 a day, and from \$125,200 to \$250,400 for the working year of 313 days, according as it ships 5 or 10 cars a day. In November, 1891, the Federal grand jury returned an indictment against Swift & Co., dressed-beef shippers of Chicago, for having received \$30,000 in rebates in the previous six months from the *Nickel Plate Road alone*. Is it any wonder that in a short time the competitors of such a firm are wiped out?"

To put such power in private hands makes talk of liberty in America almost absurd. On the other hand, Mr. J. L. Cowles shows how cheap freight and passenger transportation could be if the railroads were managed as is the postal service by the nation. He says (Preface, xi.-xii.):

"With the transportation business pooled under the control of the post-office, with a demurrage limit of eight hours—the demurrage limit of Holland and Belgium—and with trains sent from the starting point to destination over the shortest and most level routes, a uniform prepaid rate of \$1 a ton on box-car freight and 40 cents a ton on products carried in open cars would furnish an ample revenue from freight traffic. And is it not also reasonable to believe that \$1 would pay the full cost of the service for the average trip by ordinary cars on the fastest express, and that five cents a trip would meet the cost by way trains?"

To prove this he says (p. 76):

"The essential facts to be considered in the railway

business are as follows: When once a railroad is built, trains must run, and it makes very little difference in the cost of the business whether the cars go full or empty, or whether a locomotive runs alone or with a long and heavily laden train behind it; neither does it make a measurable difference in the cost whether a part of the train-load is left at one station or at another. Are the rates so high that only a royal personage can purchase a ticket? Then that single individual must bear the entire expense of the train that carries him. On the other hand, are the rates so low that 100 persons can avail themselves of the opportunity to travel? Then each traveler will be obliged to pay but a hundredth part of the cost of the train, and that cost will be increased only by the interest and wear and tear of one additional car during the trip. The expense of moving the train will be practically the same in either case, and it will hardly make a whit difference whether one passenger or all the passengers leave the train at the first station at which it stops or go through to the end of the journey. When once a train has started from Boston to San Francisco, there is not a man living can tell the difference in the cost of running that train, whether a passenger gets off at the first station out of Boston or goes through to the Golden Gate. At every station some passengers will leave the train, others will take their places. One traveler in 1000, perhaps, will go the whole journey. . . .

"Mr. Wellington (in his *Economic Theory of Railway Location*) estimates that the addition of 30 tons dead weight (and live weight is no heavier than dead weight) to a train of five cars will not increase the cost for coal in this country over one cent a mile; and since all the passengers that can be squeezed into five cars will not weigh 30 tons, it therefore follows that the variation in the haulage cost of a five-car train carrying 300 or 400 passengers and an empty five-car train is but one cent a mile. . . .

"Taking the entire expenses of an eight-car passenger train, on the New York, New Haven and Hartford Railroad main line, at \$1 a mile (the cost of the average passenger train on that road for the year ending June 30, 1893, was less than 98 cents a mile), the total cost for a 100-mile trip is \$100, or less than 20 cents for each of its 520 seats for the whole distance. The average trip of the traveler on this road, however, is but 17.04 miles, so that the average train empties itself five and eight-tenths times on a 100-mile journey, and therefore the actual seating capacity of an eight-car way-train on such a trip is over 3000, and the cost of each seat for the average ride of 17.04 miles, some of the travelers going the whole distance, others but from one station to the next, is less than three and one third cents; and even if the train is but half filled, the cost per passenger per trip is but seven cents. But the modern locomotive can haul a twelve-car train on this road at almost the same speed that it can haul eight cars, and with an additional expense, including extra brakemen and use of the extra cars, of certainly less than \$15 for the 100-mile trip, and these cars will afford accommodation for 1500 more passengers for the average 17-mile ride at a cost to the railroad of less than one cent for each seat.

"These figures are astonishing enough, but the following statement made by the conservative William M. Acworth, the highest railway authority in England, goes far beyond my estimates. Mr. Acworth says that if a passenger who would otherwise have stayed at home were induced to go from London to Glasgow by the offer of a first-class ticket for 3d (six cents), the company would, unless indeed there was no first-class seat available on the train, secure a net profit of two and three quarter pence (five and one half cents), for the remaining farthing (one half a cent) is an ample allowance for the cost of haulage. The exact figures in detail are as follows: For coal, three sixteenths of a penny; the remaining one sixteenth of a penny is more than sufficient to pay for the extra oil, and stores, and water consumed, making a total of one fourth of an English penny or one half of an American cent. Add, say, another half a cent for the wear and tear of the seat, and you have one cent. Up to the capacity of the railway trains of a country, the cost of the additional passengers who could be induced to travel by low fares would not be over one cent for a distance of 410 miles. (See "Taxes on Transport," *Nineteenth Century Magazine*, January, 1892.) . . .

"As to freight, the *Railroad Gazette* tells us that at times during the summer of 1895 the New York Central and Hudson River Railroad hauled grain from Buffalo to New York (440 miles), for 3.96 cents per 100

Cost of
Transportation.

pounds, less than 80 cents a ton, and these low rates resulting in train-loads of 1800 tons, 60 cars of 30 tons each earned for the road over \$3.24 a train mile, or more than double the average earnings per freight-train mile of the country, \$1.55744, in 1894, and far more than the earnings per mile of its own average freight train. It is safe to say that even now grain can be transported from Buffalo to New York over the New York Central and Hudson River Road for 50 cents a ton at a very handsome profit; 1800 tons at 50 cents a ton equals \$900. The cost of running the average freight train on this road in 1893 was \$1.38654 per mile, and for 440 miles, \$610.08, leaving a profit on trains of 1800 tons, at 50 cents a ton, of nearly \$300 per train trip.

"But if this be true now, what will not be possible with the new locomotives of Mr. Westinghouse, which promise to do the same amount of work as the present engines, with but one eighth the amount of fuel? . . .

"The statement of H. T. Newcomb, in the *North American Review* of July, 1896, that the average freight car of this country now does little over 12 full days' work in the course of a year, goes far in the support of these conclusions. With a reasonable system of classification, it would seem possible to reduce the transportation tax on coal and products of its class to 25 cents per ton per haul.

"Four days out of five our freight cars lie absolutely idle, obstructing side-tracks and rotting under the influence of sun and wind and rain. They will not average 73 paving hauls a year, and they earn less than \$500 a year. The average car-movement of the country is absurdly small," says the editor of the *Railway Review*, "and it is so mainly because of the misuse of the cars by the railways themselves." The car accountant of the West Shore Road, Mr. W. W.

Possible Freight Charges.

Wheatly, estimates the waste of capital in this misused equipment at over \$124,000,000, with an interest account of at least \$5,000,000 and an annual expenditure of about \$10,000,000, to say nothing of track room to hold them, locomotives to move them, and the other minor but necessary expenses which their existence involves.

"Our total railroad freight revenues for the year ending June 30, 1894, were \$699,490,013, less than \$1.10 per ton for the 638,186,553 tons handled.

"If the 1,205,169 cars belonging to the railroads had made but two paying hauls a week in that year, at \$7 per car per haul, they would have earned over \$877,000,000, and an average load of 12 tons, at an average rate of but 60 cents a ton, would have produced \$7.20 per car.

"Is there anything so very wild in a plan that leaves first-class freight at \$1.20 a ton, second-class at 80 cents, and the cheapest service at 40 cents a ton?"

Of possible passenger fares, Mr. Cowles says :

"The people of the United States take hardly half as many railroad trips during the year as do their English brethren. Our 60,000,000 people, with their 170,000 miles of railway, took less than 532,000,000 railway trips in 1891, as against over 845,000,000 by the English, with less than half our population, and with less than one eighth of the railway facilities. Will you have the reason for it? Is it not manifestly due to the cheap fares on the English working men's trains and to their numberless excursion trains? . . .

"It is to be remembered that even now, with average train-loads of but 44 persons, the average passenger fare of the country is but 53 cents, and the same locomotive that hauls these 44 persons can haul 500 at practically the same cost. (The excursion trains on the Cleveland, Canton, and Southern Railroad, in August, 1895, hauled 700 passengers at very little more cost than that of their average passenger trains and at practically the same speed.) The average

Possible Passenger Fares.

passenger train, moreover, can easily make twice as many trips during the year as at present. The present average train-load of 44 persons earns on its average 26.43-mile trip about \$23. A train of 100 first-class passengers at 20 cents a trip, and of 100 second-class passengers at 5 cents would earn \$25 in the 26.43-mile journey; but these rates would so stimulate the short-distance travel that under such conditions the train would probably empty itself every 13 miles, and the return would probably be nearer \$50 than \$25.

"Palace-car travelers, we are told, do not pay one half the cost of their transportation, and yet these are the travelers best able to bear the burden of railway

expenditure; their cars weigh at least a third more than ordinary cars; they cost a third more, while they carry hardly half as many passengers. Palace-car fares ought certainly to be from four to six times ordinary fares. Even in this case, however, this class of fares will probably be lower than they are to-day. If palace cars and sleeping cars do not pay there are two reasons for it: first, the unnecessarily high prices paid by the railways to such private concerns as the Pullman Car Company for the use of its cars; and, second, the fares which are so high that only one seat in six, perhaps, is occupied. Those whose 'good-will' is lightly regarded by our railway managers cannot afford to travel in palace cars.

"It was for the common interest, however, that railways were built, and the common interest demands the extension of the sphere of the post-office to cover this whole business, with passenger and freight schedules, something as follows:

PASSENGER SCHEDULE.	Fares per Trip.
Way trains, ordinary or second-class cars	\$.05
Palace or first-class cars	\$.20 to .30
Baggage, per piece, regulation size and weight or less, per railway trip.	\$.05
Baggage, domicile to domicile, by post.	\$.10 to .20

The objection most frequently raised to national ownership is that to put 700,000 people into government service would give infinite opportunity for political corruption, through the ap-

Objections.

pointing power and through the political power that an unprincipled administration might gain by compelling its employees to vote in one way. But the appointing power could be abolished, the believers in nationalizing the roads say, through a rigid civil service, which is to-day being adopted in all government departments; while the political danger might be avoided by refusing to allow public employees to vote. If there should be evil, it must be remembered that there is evil to-day when private corporations frequently practically compel their employees to vote in one way. Says Mr. C. Wood Davis in *The Arena* for July, 1891 :

"The second objection is that there would be constant political pressure to make places for the strikers of the party in power. . . .

"That this objection has much less force than is claimed is clear from the conduct of the postal department, which is, unquestionably, a political adjunct of the administration; yet but few useless men are employed, while its conduct of the mail service is a model of efficiency, after which the corporate-managed railways might well pattern. Moreover, if the railways are put under non-partizan control, this objection will lose nearly, if not quite, all its force."

Professor Parsons sums up the matter in a word when, to the objection that public ownership would put the roads in politics, he says: "They are in politics now, in the worst possible way." One advantage of public ownership would be publicity of management and of accounts. To day no one knows about railroad management.

The second objection to nationalized railroads is that they might be too costly. Says Mr. Davis on this point :

"Possibly this would be true, but they would be much better built and cost far less for maintenance and 'betterments,' and would represent no more than actual cost; and such lines as the Kansas Midland, costing but \$10,200 per mile, would not, as now, be capitalized at \$53,024 per mile; nor would the president of the Union Pacific (as does Sidney Dillon in

the *North American Review* for April) say that 'A citizen, simply as a citizen, commits an impertinence when he questions the right of a corporation to capitalize its properties at any sum whatever,' as then there would be no Sidney Dillons who would be presidents of corporations, pretending to own railways built wholly from government moneys and lands, and who have never invested a dollar in the construction of a property which they have now capitalized at the modest sum of \$100,000 per mile.

"The seventh objection to State-owned railways is that they are incapable of as progressive improvements as are corporate-owned ones, and will not keep pace with the progress of the nation in other respects. There may be force in this objection, but the evidence points to an opposite conclusion. When the nation owns the railways, trains will run into union depots, the equipment will become uniform and of the best character, and so sufficient that the traffic of no part of the country would have to wait while the worthless locomotives of some bankrupt corporation were being patched up; nor would there be the present difficulties in obtaining freight cars, growing out of the poverty of corporations which have been plundered by the manipulators, and improvements would not be hindered by the diverse ideas of the managers of various lines in relation to the adoption of devices intended to render life more secure or to add to the public convenience. Instead of national ownership being a hindrance to improvement and enterprise, the results in Australia prove the contrary, as in Victoria the government railways are already provided with interlocking plants at all grade crossings, and one line does not have to wait the motion of another, but all are governed by an active and enlightened policy which adopts all beneficial improvements, appliances, or modes of administration that will add either to the public safety, comfort, or convenience."

The third objection is that it would cost the people too much to buy the roads. To this those who favor the nationalization of roads answer that it need not cost the people a dollar. Says Professor Ely (in the article quoted above):

"Existing lines should be purchased, and a good, fair price, to be settled by arbitration, ought to be paid. There is no reason why an attempt should be made to get this property for less than its present value; on the contrary, there is every reason why a just price should be paid. The Government should build parallel lines only in case an honest price is refused. Thus the railways could be brought to terms. A sinking fund to repay the bonds issued must be a part of any scheme of government purchase, and charges for freight and passenger traffic should be high enough to pay all expenses and make payments to the sinking fund, and should be reduced from time to time to prevent a surplus. It is interesting to notice that in Prussia the financial success of government ownership has surpassed anticipations."

Professor Ely believes in paying a good price for the roads; firstly, in justice to the stockholders, who have honestly bought railroad stock; secondly, from reasons of expediency, in that a contrary policy would throw the interests of present railroad corporations, as well as the stockholders, so strongly against railroad nationalization that it is doubtful if the measure could be carried save by revolution. Most nationalizers agree with this view. Even so, however, the purchase would cost the country nothing, as the railroads would earn enough to more than pay interest on the purchase.

Some, however, favor more radical methods of purchase. They at least believe that the Government should be very careful what it pays for the railroads, since so much of their present valuation is watered.

According to Mr. Henry V. Poor, in *Poor's Manual of Railroads* for 1884, the average cost per mile of the railroads in the United

States did not exceed \$30,000. Accepting that estimate, the 178,708 miles in the United States, according to the report of the Interstate Commerce Commission of December, 1895, represented \$5,361,240,000, instead of \$10,796,473,813. That is, the capitalization was more than one-half water.

If the Government bought the roads at their cost value by issuing bonds, and paid interest at 3 per cent. on the bonds, the annual charge would be \$160,000,000. In the depressed year ending June 30, 1894, the gross earnings of the roads were.....\$1,073,361,797 and the gross expenses..... 731,414,322

leaving.....\$341,947,475
Subtracting the interest from this, the nation could pay the interest on the bonds and clear \$180,000,000 a year, which, applied to a sinking fund, would pay off the principal in 30 years and enable the nation, without a dollar's expense, to have a net income of \$340,000,000 annually. This is based on the depressed profits of 1894, and makes no allowance for economy through nationalization, which is estimated above at hundreds of millions of dollars, and makes no allowance for putting the sinking fund at interest.

RAILWAY ACCIDENTS.—In the year closing January 30, 1894, there were killed in the United States by railway accidents, 324 passengers and 1823 railway employees; 3034 passengers were injured and 23,422 employees. One out of every 156 employees was killed and one out of every 12 injured. One passenger was killed out of every 1,668,791 carried, or one for each 44,103,228 miles traveled, and one passenger injured for every 178,210 passengers, or one for each 4,709,771 miles. In Great Britain in 1894, 479 employees were killed and 2711 injured, or one for every 796 and every 140 employees. That is, it was five times as safe to be a railroad employee in Great Britain, as far as life was concerned, and eleven times as safe as far as life and limb were concerned. And this was a favorable year for the United States, due, says the report of the Interstate Commerce Commission, from which the facts for the United States are taken, partly, it is hoped, to the increased use of safety appliances, but partly to the decreased number of men employed. Hazell's *Annual* for 1896, from which our facts for Great Britain are taken, says: "Relative to the total train movement, the railways of the United Kingdom have in six years killed about four and one-half times fewer passengers than those of the United States, but our lines cost something like five times as much to construct." This is not, however, to

say that railroad fares or running expenses in England are so much more than in the United States. (See RAILWAYS.)

In Belgium, under State management, only 93 passengers and employees have been killed by collisions or derailments, from 1835-91, 2032 have been killed in stations, and 1062 have lost their lives by being run over; 3187 in 56 years—less than in the United States in two years. As the United States has about five times as many miles of road for her population as Belgium has for hers, 3187 accidents in Belgium would be equivalent to about 16,000 in the United States, so that Belgium has killed in 56 years, proportionately, what the United States has in eight years; both employees and passengers taken together. For employees alone, the figures are far worse.

In France, according to the *Annuaire de l'Economique Politique*, there were killed on French railways, in 1893, 514 persons to the United States 34,556 in that year.

The United States has about four times as many miles of road for her population as France has for hers, so that 514 accidents in France correspond to 2056 in the United States.

Germany in 1889-90, according to the report on Germany of the (English) Royal Commission on Labor, killed 1 employee to every 500 on her railways to the United States 1 for every 156 in the favorable year of 1894.

The cause for these enormous differences is that the railroads of Europe are far better built than those of the United States, far better manned, and far more carefully managed. The only advantage on the part of the United States is that her roads cost less to build and have cheaper freight rates.

As far as passengers are concerned, the safety in England as compared with America is mainly due to the absence in England of grade crossings and the general adoption of the block system, which is now being introduced in the United States. As far as employees are concerned, the slaughter of men in the United States is mainly of brakemen, who couple freight cars with inadequate and antiquated couplings. In 1894 only 27 per cent. of the freight cars of the United States had automatic couplers, and only 22 per cent. train brakes.

RAILWAY EMPLOYEES' ORGANIZATIONS.—Under this head we consider the organizations of railway employees of all kinds, from the conservative Brotherhood of Locomotive Engineers to the American Railway Union.

The first railway men to organize were the engineers. After early ineffectual efforts at organization, May 8, 1863, 12 engineers at

Detroit formed a Brotherhood of the Footboard, which has since grown into the Brotherhood of Locomotive Engineers. By August 1863 a Grand National Division was organized, with W. D. Robinson, sometimes called the Father of the Brotherhood, as Grand Chief Engineer. The first strike of the Brotherhood took place in 1864, on the Fort Wayne

and Chicago road, and was defeated. In 1864 the name Grand International Brotherhood of Locomotive Engineers was adopted. In 1866 *The Locomotive Engineers' Journal* was established, and in the ensuing years various orphans' and disabled members' funds. In 1872 the Brotherhood voted to expel all members engaging in a strike without the direction of their divisions. In 1874 Mr. P. M. Arthur (*q. v.*) was chosen chief of the Brotherhood, and has held the office down to the present time. His policy has been to manage the Brotherhood on purely "business" principles, strictly in the interests of its members alone, and not to unite with any other labor organization unless it could be shown directly for the interests of the Brotherhood. This policy has often gained for him the hostility of other organizations and the praise of business men for his conservatism. Nevertheless the Brotherhood has had a number of strikes. The Brotherhood, as its records abundantly show, first exhausts all pacific means, and then stops the trains at such hours as to cause as little inconvenience as practicable to the traveling and business public. The Brotherhood has been generally successful in securing a compliance with its requests without much delay. Sometimes the struggle has been protracted, the officials refusing at first to even recognize the Brotherhood. But eventually they have been compelled to do so. In a few instances strikes have been unsuccessful, owing usually to the assistance rendered by other companies. In commenting on the result of one strike, which cost the company at least half a million dollars, Chief Arthur said:

"It is not the money that has been paid the engineers that has bankrupted so many railroads. It is the speculation, fraud, and mismanagement of those high in authority. If all the legitimate earnings of the railroad companies found their way into their treasury, they could afford to pay their employees liberal wages and declare a fair dividend to their stockholders."

According to the third biennial report of the Minnesota Bureau of Labor Statistics (p. 335), the Brotherhood has paid out through its mutual life assurance associations, from the organization of this fund in 1867 to March 31, 1892, \$3,778,169. In 1892 the receipts of the Brotherhood, with about 33,000 members, were \$118,663, and its disbursements \$82,270, the grand dues of the Brotherhood being \$2 per year.

In 1868 the Order of Railway Conductors of America was organized at Mendota, Ill. It has a mutual insurance department which in 1890 received \$724,317 for 4680 members, and paid out \$680,078. The total membership of the order in 1890 was 15,769.

The Brotherhood of Locomotive Firemen was organized in an old car-shed at Port Jervis, N. Y., December 1, 1873. By 1877 there were 78 lodges, but its growth was checked by the railroad strikes of that year. (See STRIKES.) It has since, however, grown. It has now 472 lodges, and a strong insurance system, with 26,000 members, in 1892. Its official head is F. P. Sergeant of Terre Haute, Ind.

Other
Railway
Organiza-
tions.

The first lodge of Railroad Trainmen was organized September 23, 1883, at Oneida, N. Y. By 1885 it had nearly 7000 members, and 20,409 members in 1890.

The Switchmen's Railroad Aid Association of North America was organized in Chicago in 1886, and had 6453 members in 1891.

All of these organizations have well-managed insurance departments.

The American Railway Union is a new organization, and much more radical than the others. It was organized in Chicago, June 20, 1893, under the lead of Eugene V. Debs (*q. v.*). The report of the Commission on the Pullman strike (see PULLMAN) says of this union :

"The theory underlying this movement is that the organization of different classes of railroad employees (to the number of about 140,000) upon the trade-union idea has ceased to be useful or adequate; that pride of organization, petty jealousies, and the conflict of views into which men are trained in separate organizations under different leaders, tend to defeat the common object of all, and enable railroads to use such organizations against each other in contentions over wages, etc.;

The American Railway Union.

that the rapid concentration of railroad capital and management demands a like union of their employees for the purpose of mutual protection; that the interests of each of the 850,000 and over railroad employees of the United States, as to wages, treatment, hours of labor, legislation, insurance, mutual aid, etc., are common to all, and hence all ought to belong to one organization that shall assert its united strength in the protection of the rights of every member.

"In the American Railway Union there are departments of literature and education, legislation, cooperation, mediation, insurance, etc. The organization consists of a general union and of local unions. The general union is formed by representatives of local unions, who elect a board of nine directors quadrennially. This board has authority to 'issue such orders and adopt such measures as may be required to carry out the objects of the order.' Any ten white persons employed in railway service, except superintendents, etc., can organize a local union. Each local union has its board of mediation, and the chairmen of the various local boards upon a system of railroads constitute a general board of mediation for that system.

"The constitution provides that :

"All complaints and adjustments must first be taken up by the local union; if accepted by a majority vote, it shall be referred to the local board of mediation for adjustment, and, if failing, the case shall be submitted to the chairman of the general board of mediation; failing in which, they shall notify the president of the general union, who shall authorize the most available member of the board of directors to visit and meet with the general chairman of the board of mediation and issue such instructions as will be promulgated by the directors.

"Under these provisions it is claimed that no strike can be declared except by order of a majority of the men involved."

The union is said to number about 150,000. (For an account of the relation of the A. R. U. to the Pullman strike, see PULLMAN STRIKE.)

Such are the main organizations of railway employees in the United States. There are others, and there are continual efforts to get these organizations to unite, but as yet no permanent union has been effected. At times of strikes they often, however, act together. (See STRIKES.)

The great English railway employees' organizations are the Amalgamated Society of Railway Servants, and the Railway Workers' Union.

The former, established in 1872, is a trade

friendly society of the old type, with high dues and extensive benefits. It had 30,000 members in 1891. The latter, established in 1889 as a rival to the Amalgamated, represents the new trade-unionism. It voted, November, 1890, "That the union shall remain a fighting one, and shall not be encumbered with any sick or accident fund."

Besides these is the Associated Society of Locomotive Engineers and Firemen, established in 1880, and with 7000 members. (See also FRANCE; GERMANY.)

RAILWAY STRIKES. See STRIKES.

RAU, KARL HEINRICH, was born in Erlangen in 1792. In 1818 he became professor at Erlangen, and in 1832 at Heidelberg. From 1837 to 1840 he was in the first chamber of the Grand Duchy of Baden, and later a counsellor of the Duchy. He died in 1870.

His *Lehrbuch der Politischen Oekonomie* (1864) was until 1874 recognized in Germany as an authority, and almost an encyclopedia in economic studies.

RECEIVERS are persons appointed by the courts to receive rents, issues, or profits of land, or other property which is in question between the parties to a litigation, or which belongs to one who is legally incompetent, as an infant. They are appointed in justice as a benefit for all concerned. Railroad receivers are given power which receivers of all corporations are not, since railroad corporations are of quasi-public character. They are allowed to borrow money to conduct the railroad. But this trust is not unfrequently abused. Says the Report of the Interstate Commerce Commission for 1894 (1895), (pp. 84-85) : "The conduct of many receivers in the management of railroad property justifies such reliance in a very slight degree."

RECIPROCITY in trade is an agreement made between two countries, whereby they agree to make reciprocal or equivalent reductions in the duties on certain articles. This policy has been considerably advocated in the United States, and prominently by James G. Blaine. By the third section of the act of Congress of 1890, called the McKinley act, it was provided that, "with a view to secure reciprocal trade," sugars not above 16 Dutch standard, molasses, coffee, and hides should be admitted into the United States free of duty, unless the President should become satisfied that reciprocal favors will not be granted to the products of the United States." Arrangements of this character were concluded with Brazil, Honduras, Salvador, Guatamala, Nicaragua, Austria-Hungary, Germany, Spain (for Cuba and Porto Rico), and Great Britain (as to British Guiana and certain of the British West Indies). These arrangements were superseded by the tariff act of August, 1894.

RECLUS, JACQUES ÉLISÉE, was born at Sainte Foy la Grande in 1830, and studied in Rhenish Prussia, and at Berlin. Coming to

Paris, his extreme republican views caused him to leave the country after the *coup d'état* of December 2, 1851. Till 1857 he traveled in England, Ireland, the United States, and New Granada, and in 1857 returned to Paris, and published his geographical researches. He wrote various scientific works, contributing, however, as well to anarchist and radical journals. Taking part with the Paris Communards in 1871, he was arrested, and tho defended by eminent scientists, was sentenced to transportation for life, a sentence afterward changed to one of banishment. Going to Switzerland, he was admitted to the benefits of amnesty in 1879. In 1882 he initiated the anti-marriage movement, his two daughters marrying without religious or civil ceremony. In 1892 he was appointed professor of comparative geography at the University of Brussels. The first volume of his *Geographie Universelle* was published in 1875, the seventeenth in 1891. His main anarchist writings are *Anarchy by an Anarchist* (1884), and *Evolution and Revolution* (1891). In 1878 he wrote to a congress of anarchists at Freiberg: "We are revolutionaries because we desire justice. . . . Progress has never resulted from mere peaceful evolution. . . . We are anarchists who recognize no one as our master. . . . There is no such thing as morality without liberty. . . . We are also International Collectivists, for we are aware that the very existence of human beings necessarily implies a certain social grouping."

RED CROSS SOCIETY, THE, was organized in Europe, at Geneva, in Switzerland, in 1866; in the United States in 1884. Its organization in Switzerland was due to the efforts of Mr. Henri Dunant. The name comes from its flag, a red cross on a white field.

"It is a confederation of relief societies in different countries, the aim of which is to ameliorate the condition of sick and wounded soldiers in time of war; and its operations extend over nearly the entire civilized world." This is from the original constitution of the society in Europe. In this country, comparatively exempt from the danger of war, its scope is enlarged. The constitution contains an article in that of no other of the 39 nations organized under this treaty. It is "that our society shall have for one of its objects aid to the suffering in times of great national calamities, such as floods and cyclones—visitations to which we are peculiarly liable—great fires, pestilence, earthquake, local famines." Its work has been almost exclusively in line of these calamities.

During our Civil War the first organized work in this line commenced, and, with Miss Clara Barton at its head, did noble service in alleviating the suffering of the sick and wounded. It was not, however, until after the close of our war, when Miss Barton, broken in health, was ordered to Europe to recuperate, that the question of our joining in the Red Cross movement with foreign nations was seriously considered. A committee of the "International Society of Switzerland," the

original society, waited upon Miss Barton to ask why our country held aloof from the Red Cross movement. She had not before heard of it, became very much interested, and, as soon as possible after her return to the United States, presented the matter to the Government, and it was favorably acted upon.

Twelve great national calamities have claimed the services of the Red Cross in the United States. After the great forest fires of Michigan came the floods in Ohio and Mississippi in 1882; the Mississippi cyclone; the floods of 1884; the Virginia epidemic; the Texas drought; the Charlestown earthquake; the Mount Vernon (Illinois) cyclone; and the great Johnstown disaster. The society also ministered to the peasants of Russia during the great famine there, and, at this writing, Miss Barton is in Turkey, aiding the Armenians, tortured and plundered by the Turks. As soon as a calamity becomes known, the president of the society and her associate helpers start for the scene of the disaster, taking with them supplies of every sort—food, clothing, materials, and tools for building, household utensils, etc.

REFERENDUM AND INITIATIVE, THE.—For the general principles involved in the Referendum and the Initiative, and for the reasons for their advocacy, see **DIRECT LEGISLATION**.

The Referendum may be defined in general as the referring of legislation to the people for final rejection or acceptance; the Initiative, as the giving to the people the right of proposing legislation to be acted upon.

According to the Referendum, as it is now generally advocated, no law, save a strictly defined class of urgent measures for the public peace, health, and safety, which require a two-thirds or three-quarters majority to pass, would go into effect without waiting a fixed time, say 90 days. If, during this time, a part of the voters, say 10 per cent., sign a petition for the Referendum on that law, it would not go into effect till the next regular election, when the people would vote on it, and if a majority voted no, it would not be a law.

By the Initiative, if a certain percentage of the voters, say 10 per cent., sign a petition for a law and file it with the proper official, it must come before the legislature, and perhaps be referred to the people. Sometimes the law requires that legislation be referred to the people, whether they petition for it or not. This is called the compulsory Referendum. Where the Referendum is taken only when a certain number petition for it, it is called the optional Referendum. Together the Referendum and the Initiative furnish direct legislation.

Says Mr. J. W. Sullivan (*Direct Legislation*, p. 17):

"There is a radical difference between a democracy and a representative government. In a democracy, the citizens themselves make the law and superintend its administration; in a representative government, the citizens empower legislators and executive officers to make the law and to carry it out. Under a democracy, sovereignty remains uninterruptedly with the citizens,

or rather a changing majority of the citizens; under a representative government, sovereignty is surrendered by the citizens, for stated terms, to officials. In other words, democracy is direct rule by the majority, while representative government is rule by a succession of quasi-oligarchies, indirectly and remotely responsible to the majority."

Says Mr. W. D. McCrackan (*The Swiss Referendum*):

"This Swiss Referendum must not be confounded with the French plebiscite, and deserves none of the odium which attaches to that destructive institution. The latter is a temporary expedient, illegal and abnormal, used only at moments of great national excitement when the popular vote has been carefully prepared and ascertained by unscrupulous adventurers. The plebiscite has invariably proved itself to be a device invented by tyrants to entrap the people into giving assent to their usurpations, whereas the Referendum acts through regular channels, established by law, sanctioned by the people and therefore constitutional."

The home of the Referendum and the Initiative is the Swiss Republic, where from times almost immemorial the people of at least some of her cantons, and notoriously of Uri and Appenzell and the two Unterwalds, have met, in assemblies, or *landsgemeinden*, in the open, and decided laws by a direct popular vote. As however the cantons (see SWITZERLAND) grew in population, and the confederation took in towns and cities, this was not always possible, tho the custom still

History in Switzerland.

obtains in Uri, Appenzell, Glarus, and the two Unterwalds. Yet even in the cities at various times all the citizens were asked to vote on certain measures, as in Berne and Zürich at the time of the Reformation, to see how many were Protestants. Berne, from 1469 to 1524 is said to have taken 60 Referendums. The Referendum appears too in a rudimentary form as early as the sixteenth century in the cantons of Graubünden or Grisons and Valais, before those districts had become full-fledged members of the Swiss confederation, and while they were still known as *Zugewandte Orte*, or Associated States. Delegates from their several communes met periodically, but were always obliged to refer their decisions to the communes themselves for final approval. In the same manner the delegates from the various cantons to the old Federal Diet, or assembly of the Swiss confederation, referred their votes to these States. In 1802 the constitution of the Helvetic Republic was referred to a popular vote. Most of the Swiss cantonal constitutional changes have been made by the Referendum, and their constitutions now usually require that all such changes be thus made. St. Gall gave the people the right to prevent a law coming into force in 1831; rural Basle in 1832; Valais, 1839; Lucerne, 1841. Valais in 1842 passed a measure referring all laws to the people, but the people voted against the law. Vaud in 1845, and Berne in 1846, adopted the optional Referendum. In 1868, after an agitation largely led by the socialist, Karl Bürkli (*q. v.*), the compulsory Referendum was adopted and the Initiative, if one-third of the members of the Great Council, or 3000 citizens, demanded it. Thurgau, Berne, Schaffhausen, soon followed, till the Referendum exists today in all the Swiss cantons except Fribourg.

Ten have the compulsory, eight the optional Referendum, six the *Landsgemeinde*.

The Federal Referendum was established in 1874. It is optional. The demand for it must be made by 30,000 citizens or by eight cantons. The petition for a vote under it must be made within 90 days after the publication of the proposed law. It is operative with respect either to a statute, as passed by the Federal Assembly, or a decree of the executive power. Of 149 Federal laws and decrees subject to the Referendum, passed up to the close of 1891 under the constitution of 1874, 27 were challenged by the necessary 30,000 petitioners, 15 being rejected and 12 accepted. The Federal Initiative was established by a vote taken on Sunday, July 5, 1891. It requires 50,000 petitioners, whose proposal must be discussed by the Federal Assembly and then sent, within a prescribed period, to the whole citizenship for a vote. The Initiative is not a petition to the legislative body; it is a demand made on the entire citizenship.

Federal Referendum.

The Federal constitution may be revised at any time. Fifty thousand voters petitioning for it, or the Federal Assembly (Congress) demanding it, the question is submitted to the country. If the vote is in the affirmative, the council of States (the Senate) and the National council (the House) are both dissolved. An election of these bodies takes place at once; the Assembly, fresh from the people, then makes the required revision and submits the revised constitution to the country. To stand, it must be supported by a majority of the voters and a majority of the 22 cantons.

From its establishment in 1874, to January, 1895, the Federal Assembly passed 180 bills of a general character. For these the Referendum was demanded for 18; the people accepted 6, and rejected 12.

The Federal Initiative was adopted by a vote taken July 5, 1891.

The following is the Swiss Federal Referendum and Initiative Law (from United States Consular Report, vol. xlvi. No. 170):

I. The Referendum.

"ARTICLE 1. Federal laws, as well as federal enactments which are binding, if not of an urgent nature, shall be submitted to the vote of the people on the demand of at least 30,000 Swiss citizens, or of the governments of at least eight cantons.

"ART. 2. The Federal Assembly will decide whether a federal act is binding or urgent, and the decision has in every case to be expressly incorporated in said act. In such case, the Federal Council will provide for the execution of the law, and have it entered on the statute book.

"ART. 3. All federal laws, as well as acts, which do not conflict with Article 2, are to be published immediately after their enactment, and a sufficient number of copies must be sent to the cantonal governments.

"ART. 4. If the referendum is demanded by the people, or by the cantons, the same must be filed within 90 days, counting from the day of the publication of the law or the enactment, in the official organ of the confederation.

"ART. 5. The demand for an election is to be in writing and addressed to the Federal Council; citizens who wish to sign the demand must do so in person; any one signing another's name shall be subjected to punishment for forgery; the authorities of the respective communities must certify as to the voting right of electors whose signatures are appended to the referendum demand; no fee shall be collected for such certificates.

"ART. 6. If a number of cantons make the demand (referendum), it has to be made through the canton councils, provided that the cantonal constitution does not prescribe other rules.

"ART. 7. If, after the expiration of the 90 days dating from

The Swiss Law.

the first publication of a federal law or enactment in the official federal organ, no demand for an election has been made by the people, or if such demand has been made within the period named, but the official count shows that the requisite 30,000 signatures, or eight cantonal governments, have not been obtained, the Federal Council will declare the respective law or enactment in force, and will order the same incorporated in the statutes.

"The signatures asking for a referendum will be published in the federal organs, showing the number of signatures from each canton or community; further, the demands made by the cantonal governments in accordance with Article 6 will be published. Moreover, the Federal Council will report the result to the Federal Assembly at its next meeting, and submit the records relating thereto.

"ART. 8. If, on the other hand, it is found upon examination of the application, that the request has been signed by the requisite number of cantons, then the Federal Council will order the question submitted to the vote of the people. It will also inform the cantonal governments thereof, and order the enactment referring thereto to be published without delay.

"ART. 9. All the citizens of Switzerland will cast their vote on the same day, which will be named by the Federal Council.

"ART. 10. Every male Swiss citizen, who has attained his 20th year, is entitled to vote, provided he is not debarred therefrom by the law of the canton of which he is a resident.

"ART. 11. Each canton has to provide for the election within its territory, in accordance with the federal prescriptions relative thereto.

"ART. 12. A record of the vote shall be kept in each community or each district. Such record must contain the exact number of persons entitled to vote, and the number of yeas and nays that have been cast for or against the law in question.

"ART. 13. The cantonal governments must send these tally lists, within 10 days, to the Federal Council, holding the ballots at the disposal of said Council. By these records the Federal Council will determine the result of the election.

"ART. 14. The federal law or the federal enactment is to be regarded as in force if a majority of the votes cast have been found in favor of the same. In such cases, the Federal Council will order the same enacted and incorporated in the federal statutes.

"ART. 15. If, on the contrary, a majority is found to be against the law, the same will be declared rejected, and, therefore, void.

"ART. 16. In both cases the Federal Council will publish the result of the election, and inform the Federal Assembly thereof at its next meeting.

"ART. 17. The Federal Council is charged with the execution of the present law."

II. The Initiative.

"ARTICLE 1. A revision of the federal constitution, as a whole or in part, can at any time be demanded by way of the initiative. (See Articles 118, 120, and 121 of the constitution.)

"ART. 2. If any one desires to use this franchise, an application signed by at least 50,000 voters, who must be Swiss citizens, is to be addressed in writing to the Federal Council, who will submit the same to the Federal Assembly. This application must contain the subject of the initiative.

"ART. 3. Any citizen wishing to make such application must sign it personally. Any one signing another's name will be indicted for forgery and punished accordingly.

"ART. 4. Each list containing the signatures must name the canton and the community of which the applicants are residents. To be valid it must also specify: (1) The text of the initiative; (2) the text of Article 3 of this law; (3) a certificate of the city authorities, properly dated, showing the applicants to be entitled to vote on federal laws, and that they are qualified electors in their communities. No fee shall be collected for this certificate.

"ART. 5. Having received the revision demand, the Federal Council will canvass the signatures and determine the number entitled to vote. Debarred from voting will be: (1) Those whose signatures have not been

certified to, within the period of six months, dating retrogressively from the day on which the revision demand is received by the Federal Council; (2) the signatures contained in an unvalid list (see Article 4); (3) those signatures, the registration of which is missing, incomplete, or incorrect. Any signatures showing to be in the same handwriting are classed as invalid, and will not be counted. The Federal Council will issue reports in its official organ showing the result of the investigation, and will submit the same to the Federal Assembly at its first meeting, together with all other acts relating thereto.

"ART. 6. If a demand for a revision, or an initiative requiring a total revision of the constitution is found valid, the question whether this revision shall take effect must be determined by the vote of the whole Swiss people. If the majority is in favor of revision, both the State Council and the National Council must be reelected, and the new incoming councils must proceed to revise the constitution *in toto*.

"ART. 7. If the initiative demands the repeal, abolition, or change of certain articles of the constitution, and if the same is framed in the form of a general bill, both councils will have to decide within one year whether they agree with the demand or not. If they agree, they will provide for the necessary legislation in accordance with Article 121 of the constitution. If they reject the demand, or cannot come to a decision within the stated period, the Federal Council will then call a general election. If the majority of Swiss citizens vote in favor of the demand, the Federal Assembly shall, without delay, take the matter in hand and make the required revision, after which the revised articles will be again submitted to the vote of the whole Swiss voters.

"ART. 8. If, on the other hand, the demand is in the form of an elaborate project, the two councils shall decide, within a period not exceeding one year, whether they agree with this project or not.

"ART. 9. If the two councils cannot come to a unanimous conclusion regarding said project, it will be subjected to the vote of the people, and the vote of the cantons, as also is the case if the Federal Assembly concludes to agree to the project.

"ART. 10. If the Federal Assembly decides not to agree to the demand, the people will vote on the question. The Federal Assembly has a right, however, to recommend to the people the rejection of the project, or propose a new one prepared by the Assembly.

"ART. 11. In case the Federal Assembly proposes a special elaborate project, in opposition to the demand for revision, the people will have to vote on the two questions, as follows: (1) Do you accept the project for revision demanded by the Initiative? or (2) Do you accept the project of the Federal Assembly?

"ART. 12. The blank and invalid ballots are not counted in determining the result of the vote. Ballots which answer one question with "yes," and the other with "no," or both questions with "no," are valid. Ballots which answer both questions with "yes" are void.

"ART. 13. The project which is accepted by the majority of the voters and the majority of the cantons will become a law.

"ART. 14. The records of the vote must contain the number of residents in the community entitled to vote, the number of ballots, the number of invalid votes, and, finally, the number of yeas and nays for each of the questions.

"ART. 15. If, on the same article of the constitution, several demands for revision have been made, they must be voted on separately in accordance with the date of their filing.

"ART. 16. As for the rest, the prescriptions of the federal law of June 17, 1874, relative to federal election laws and regulations, must be followed.

"ART. 17. The federal law of December 5, 1867, relative to the constitutional revision demand, is hereby repealed, as well as the Federal Council's prescriptions dated May 2, 1870.

"ART. 18. The Federal Council shall publish this law and the date of its enactment in accordance with the prescriptions of the federal law of June 17, 1874, relative to federal election laws and decisions of the Federal Council."

Few people who have not made special study of this question, realize how firmly the principles of direct legislation are rooted in the United States.

The New England town meeting in itself is at once the simplest and best known example

of the principle underlying the Initiative and Referendum. Constitutional amendments are referred to the people in every State of the Union, except Delaware. Local Option is a form of the Referendum.

In 15 States no law changing the location of the Capital is valid until submitted to a popular vote; in seven, no laws establishing banking corporations; in 11, no laws for the incurrence of debts, excepting such as are specified in the Constitution, and no excess of "casual deficits" beyond a stipulated sum; in several, no rate of assessment exceeding a figure proportionate to the aggregate valuation of the taxable property. Without the Referendum, Illinois cannot sell its State canal; Minnesota cannot pay interest or principal of the Minnesota railroad; North Carolina cannot extend the State credit to aid any person or corporation, excepting to help certain railroads unfinished in 1876. With the Referendum, Colorado adopted woman suffrage and may create a debt for public buildings. Texas may fix a location for a college for colored youth; Wyoming may decide on the sites for its State university, insane asylum, and penitentiary.

It is becoming more and more the custom to seek popular ratification for popular measures, as in the Massachusetts State elections of November, 1893, the so-called Aldermanic and Rapid Transit Bills were voted upon at the polls. For a number of years past, many of the labor unions have used the Initiative and Referendum in their organizations.

The working of the Referendum and Initiative, many believe, has been on the whole toward conservatism rather than radicalism. In Switzerland the Federal Referendum has rejected more legislation than it has accepted. Says Professor Wuarin of the University of Geneva (*Annals of the American Academy of Political and Social Science*, November, 1895):

"The right of initiative, it is alleged, has thus far only resulted in federal matters—and, cantonally, it must work in much the same way—in bringing about strange results. In its first operation, two years ago, it introduced a law against the Jewish mode of slaughtering cattle; in the second one, on the 3d of June, 1894, it endeavored to have the 'right to employment' acknowledged by the Constitution; this was rejected. Before coming to the third and last operation, let us pause a moment. Here our answer, in presence of such facts, is that the right of initiative, especially at the outset, was expected to have some awkward consequences. But where is the serious harm it may be instrumental in doing? It can incorporate in the Constitution things of a queer appearance, such as the butchery ordinance of 1893,* but these apparently awkward measures happen to be in accordance with the popular wish. This is democracy. It can also deal with proposals of an impractical, dangerous, socialistic character, as the right to labor, but in an enlightened community such schemes are sure to meet with a decisive opposition, and in such circumstances the resort to the plebiscite has the effect of

Conservative Tendencies.

* A short explanation may here be required. In spite of an undeniable dash of antisemitism to be regretted, that regulation, now a constitutional amendment sanctioned by the citizens, must be regarded as an important step in a new direction. The Swiss people declared that public law should not neglect questions of humanity, even toward animals. If local or cantonal authorities had in that respect given satisfaction to the feeling of the people, the strange ordinance would never have been thought of.

purging the political atmosphere of chimerical and distracting elements. This clearing the ground has been generally acknowledged to be most useful.

"But let us come now to the third and last case in which, up to the present time, the right of popular initiative was resorted to. The question at issue originated among the Catholic and some Protestant Conservatives, and was soon known under the very appropriate name of the 'Spoils Campaign' (*Beutesug*). The bill framed on this occasion by the initiators aimed at obtaining money from the Federal Treasury for the different cantons, which was to be apportioned at the rate of two francs per head of population.

"The chances of success for the new crusade were great at the start. The Federal Government had caused some dissatisfaction by exaggerated expenses and by somewhat undemocratic conduct toward the wishes of the people. A few days before the popular vote, there appeared in one of our periodicals a discussion of the question by M. Numa Droz, late president of the Swiss Confederation. He said that the Referendum was good for the welfare of our commonwealth as a means of controlling the work of the law-makers, but he considered the introduction of the right of initiative as the beginning of the era of demagoguery. If the 'Spoils Campaign' should succeed, said he, the basis of our public law would be altered and shaken, and no other resource would remain to the friends of democracy than to call together a convention in order to frame a new Swiss constitution, doing away with such exaggerations of democracy. Never since the agitation of 1848 had Switzerland experienced such a vital crisis.

"But the 'Spoils Campaign' was defeated by more than two to one in the vote of the 4th of November last. The atmosphere suddenly cleared. The fears expressed by M. Droz vanished. Every one felt that the Swiss people was ready for direct democracy. The *Temps* of Paris echoed such views and said that the Swiss democratic institutions were now proven safe."

Indeed the working of the Initiative and Referendum in Switzerland has been so "safe" that many socialists believe it reactionary. Says a resolution printed in the (English) *Fabian News* for April, 1896, to be presented to the Socialist Congress of 1896:

"Resolved, That this Congress warns associations of the working classes throughout the world to scrutinize with great care all proposals for transferring direct legislative and administrative power, including the appointment of public officials, from representative bodies to the mass of the electors. The people can only judge political measures by their effect when they have come into operation: they cannot plan measures themselves, or foresee what their effect will be, or give precise instructions to their representatives; nor can any honest representative tell, until he has heard a measure thoroughly discussed by representatives of all other sections of the working class, what form the measure should take so as to keep the interests of his constituents in due subordination to those of the community. It is to be considered, further, that intelligent reformers, especially workmen who have grasped the principles of socialism, are always in a minority: they may address themselves with success to the sympathies of the masses and gain their confidence; but the dry detail of the legislative and administrative steps by which they move toward their goal can never be made interesting or intelligible to the ordinary voter. For these reasons the Referendum, in theory the most democratic of popular institutions, is in practise the most reactionary, and is actually being strenuously advocated in England by noted leaders of anti-socialist opinion with the openly declared intention of using it to stop all further progress toward social-democracy."

Nevertheless, the reasons for favoring direct representation within reasonable limits are all but overwhelming. Its advocates believe it to be the deathblow of corrupt legislation, which is so frightfully prevalent in modern democracies. (See DIRECT LEGISLATION.)

RELIGION IN THE PUBLIC SCHOOLS.

—One of the most difficult problems, and one arousing to-day most bitter animosities in all countries not under the complete domination of one State Church, is that of religion in the public schools. Radical minds usually hold that the public schools should have nothing to do with religion. Most Christians, however, contend that the State is lost unless it teach morality, and that morality cannot be taught unless it teach religion ; while the majority of Roman Catholics, some Anglicans, and a few of other religious communions go still further and say that morality cannot be taught except by giving the definite religious teaching of their respective churches. There are thus at least three distinct views held, and an indefinite variety of shades of opinion and of intensity of conviction. To each party (radicals not excepted) it is to a large extent a matter of faith or of principle to carry out their view. From time to time various compromises are effected, such as allowing representatives of different faiths to teach in the public schools the children of their communion, or dividing the public funds between denominational schools. But these compromises rarely satisfy any party, and bitter feeling continually breaks out, as at present in Manitoba, Canada, in the A. P. A. (*q. v.*) movement in the United States, and over the Education Bill, now before Parliament, in Great Britain (1896). The lines on which the question will ultimately be settled no one can tell. Each party to the controversy appears to think that ultimately the world will be converted to its view, and the problem be settled in its favor. In the mean while the best that can be hoped now is for each side to try and understand the feelings of its opponents, and submit to the action taken by the majority in power.

The radical view is that the province of the State is wholly secular ; that its true attitude is of absolute neutrality toward all forms of religious belief and unbelief ; and that to teach religion in any form is to do violence to the rights of certain classes of citizens.

The Jewish Exponent for August 16, 1889, quotes Rabbi Calisch as saying :

“The public schools are an outgrowth of our broad American republicanism, which, in the interest of freedom, forbids any union or partnership of Church and State. Hence, in the name of the Jewish brotherhood all over this country, and in the name of persons of differing views on religious matters everywhere, I wish to protest against the manner in which our public schools are conducted. It is a favorite claim of the churches,” he continues, “that this is a Christian country, and this, so far as it is confined to the church instruction or family instruction, is unobjectionable and right. The idea of Christ, however, is not confined to such teaching. It is, with all its religious dependencies, made a part of our public-school instruction. It is to be denounced as in violation of the fundamental theory of our government. I demand, in the name of justice, that the principle of law, designed to protect all in their religious freedom, be recognized.”

Radical View.

The platform of the Liberal League of the United States contains the following :

“We demand that all religious services now sustained by the Government be abolished, and especially that the use of the Bible in the public schools, whether as a text-book or avowedly as a book of religious worship, shall be prohibited.”

This is the view held by almost all socialists and by radicals of almost every description. They hold that religion is a personal matter, to be taught in the family or the home. They do not admit that this prevents ethical and moral teaching in the schools.

The view of Roman Catholics, and other believers in parochial or denominational schools, is that morals cannot be taught without religion ; that religion cannot be taught in public schools, since it is unjust to tax a Jew to support the teachings of Christianity, or *vice versa*, and that therefore the only way out is to have parochial schools where morals and religion can be taught. Such advocates usually claim that money should be raised for education by the school authorities and then that in some way it should be divided among the various denominational or secular schools in proportion to the pupils in each.

Said Archbishop Ireland, in his address to the National Educational Association (St. Paul, July, 1890, :

“There is and there can be no positive religious teaching where the principle of non-sectarianism rules.”

Says the *Catholic Review* of August 31, 1889 :

“The parochial school is necessary because Catholic children cannot be brought up Catholic and attend the public school. This is a recognized fact. . . . At the present moment the Catholic Church in America depends more on the faith of the Catholic immigrant than on the faith of the generation which has received its education in the public schools. . . . We see no way of making them (young Americans) Catholics than by the parochial school. Our conscience forces us to take up the work.”

Dr. Josiah Strong (*Our Country*, revised edition, p. 74) gives authoritative utterances defining the Roman Catholic attitude to public schools :

“Pius IX says it is an error to hold that, ‘The entire direction of public schools . . . may and must appertain to the civil power, and belong to it so far that no other authority whatsoever shall be recognized as having any right to interfere in the discipline of the schools, the arrangement of the studies. . . . or the choice and approval of teachers.’* And again : ‘It is an error that, ‘The best theory of civil society requires that popular schools . . . should be freed from all ecclesiastical authority, government, and interference, and should be fully subject to the civil and political power in conformity with the will of rulers and the prevalent opinion of the age.’† Again : ‘It is an error, that ‘This system of instructing youth, which consists in separating it from the Catholic faith and from the power of the Church . . . may be approved by Catholics.’‡ Bishop McQuaid, in a lecture at Horticultural Hall, Boston, February 13, 1876, declared :

* *Syllabus of Errors*, December 8, 1864. Proposition No. 45. Allocution, *In Consistoriali*, November 13, 1850.

† *Ibid.*, Proposition No. 47. Letter to the Archbishop of Fribourg, *Quum non sine*, July 14, 1864.

‡ *Ibid.*, Proposition No. 48. Letter to the Archbishop of Fribourg, *Quum non sine*, July 14, 1864.

Roman Catholic View.

'The State has no right to educate, and when the State undertakes the work of education it is usurping the powers of the Church.'

There are various ways or compromises in which it has been proposed to meet the Roman Catholic position, but the fundamental proposition is always the same.

On the other hand, another school of thought claims that, while the public schools cannot teach denominational religion, they should teach religion. Says Dr. Strong (*Our Country*, p. 101):

"In his 'Institutes of International Law,' Judge Story says, 'One of the beautiful traits of our municipal jurisprudence is that Christianity is part of the common law from which it seeks the sanction of its rights, and by which it endeavors to regulate its doctrine.' Says the great interpreter of the Constitution, Webster: 'There is nothing we look for with more certainty than the general principle, that Christianity is part of the law of the land . . . general, tolerant Christianity, independent of sects and parties.'*

"Undenominational Religious Views."

ties.* Many other authorities to the same effect might be cited.

"When the fathers added to the Constitution the principle of strict separation of Church and State, they did not intend to divorce the State from all religion. Says Judge Story, speaking of the time when the Constitution was adopted, 'The attempt to level all religions, and make it a matter of State policy to hold all in utter indifference, would have created universal disapprobation if not universal indignation.'† The principle of the separation of Church and State undoubtedly forbids sectarian instruction in the State schools; but we have the highest legal and judicial authority for saying that it does not forbid undenominational religious teaching. . . . Why does the State take money from your pocket to educate my child? Not on the ground that education is a good thing for him, but on the ground that his ignorance would be dangerous to the State. . . . In like manner the State must teach in its schools fundamental religious truths, not because the child should know them in preparation for a future existence—the State is not concerned with the eternal welfare of its citizens—but because immorality is perilous to the State, and popular morality cannot be secured without the sanctions of religion."

"The philosopher Cousin, in a report upon public instruction in Germany, referring to the fact that it is based on the Bible, says: 'Every wise man will rejoice in this; for, with three-fourths of the population, morality can be instilled only through the medium of religion.'"

Daniel Webster in a Fourth of July oration said:

"To preserve the Government we must also preserve morals. Morality rests on religion. If you destroy the foundation, the superstructure must fall. When the public mind becomes vitiated and corrupt, laws are a nullity and constitutions are waste paper. . . ."

"Of course parents and the Church may give as much added instructions as they wish, but for the State to go beyond the inculcation of the fundamental truths common to all monotheistic religions would probably lead to the division of the school fund, which would be a great calamity. On the other hand, to secularize the schools is to invite the corruption of popular morals and thus endanger the very foundations of our free institutions."

In the United States various ways of compromise with the Roman Catholic view have been tried. As early as 1823 in New York, a conflict arose about the division of public funds. In 1831 a grant of \$1500 was made for a Roman Catholic Orphan Asylum. In 1868 in New Haven, Conn., a Roman Catholic

school taught by Sisters of Charity was sustained by public funds. Roman Catholic schools were sustained in the same way in Waterbury, Conn., Manchester, N. H., and notably at Poughkeepsie, N. Y. New York in 1888 spent \$1,672,000 for sectarian charities, \$989,000 for Roman Catholic charities. Recently a liberal movement has appeared among the Roman Catholics in the United States. Of this movement Dr. Lyman Abbott said in a sermon preached in Plymouth Church, January 22, 1893:

"It maintains that the Roman Catholic Church can be an American Church; that the Roman Catholic Church is adapted to American institutions; that Roman Catholic children shall learn the American language; and now it has gone further, and insists that they shall be received into the public schools, and that the public schools shall be maintained with the sanction and the moral support of the Roman Catholic Church. In August, 1891, this proposition first appeared in a practical form, in what is now known as the Faribault experiment. The Faribault experiment, deriving its name from the town in Minnesota where the event took place, was simply this: Under the auspices and with the approval of Archbishop Ireland, a parochial school belonging to the Church of the Immaculate Conception, was handed over to the school authorities of the State for a rental of one dollar; all the teachers, all the text-books, all the work of the school to be carried on under the authority of the State, without any limitation or qualification of any kind whatever. I desire to put this very emphatically before you, because, in a great deal of discussion that has gone on, it has been assumed that there was a kind of agreement that the public-school authorities should appoint Roman Catholic teachers, and so maintain in some way Roman Catholic discipline. Both the official documents and the positive assertion by the Roman Catholic father on the one hand and the school authorities on the other, negative this assertion."

Faribault Plan.

This action has aroused intense excitement, and not least among Roman Catholics. It was defended and condemned. The Pope, therefore, sent a papal legate who came before a meeting of the archbishops and bishops gathered to discuss this educational question, and submitted to them certain propositions, apparently with the approval of the Vatican. These propositions include such as these—that the Church of Rome does not disapprove of the public schools; that it absolutely forbids priests or bishops to excommunicate parents because they send their children to the public schools, or to deprive their children of the sacraments because they go to the public schools; that, so far from disapproving of public schools, it approves them, provided they can be carried on in such a way that the moral and religious training of the children can be provided for. Three ways are suggested by which that provision can be made: First, by religious education by the Church in the school building out of school hours; secondly, by religious education by the Church, not in the school building, but in a building provided for the purpose; and, finally, where neither of these methods are practicable, then in the family.

This position was attacked notably, if secretly, by Archbishop Corrigan of New York city, but the legate seems to have been supported by the Pope.

Such is the present position, complicated by the recent movement of the A. P. A. (*q. v.*),

* Webster's Works, vi. p. 176.

† Commentaries on the Constitution of the United States. Boston, 1833. Subject discussed at length, pp. 680 seq.

leading to violence in Boston, Mass., and bitter feeling elsewhere.

In Canada, in England, and in Continental Europe, the situation is even more complicated on account of the relations of Church and State. On the Continent, State grants to the various religious bodies for various purposes are the rule, but are denounced by most socialists and radicals.

In England, where "Board" [Public] Schools are just developing, the situation is at this writing too uncertain to allow of characterization. (For the condition that has prevailed, see EDUCATION.)

(See also AMERICAN PROTECTION ASSOCIATION and ROMAN CATHOLIC CHURCH AND SOCIAL REFORM.)

RENT (F. *rente*; It. *rendita*, income; Latin *rendare*, to return) is used, in political economy, specifically for "that portion of the produce of the earth which is paid to the landlord for the use of the original and indestructible powers of the soil" (Ricardo, *Political Economy*, chap. ii.). The word is sometimes used, even in political economy, in other senses, but in that case the use is explained by the author as something different from the ordinary use, as when one speaks of the rent of ability, the rent of money, the rent of a piano, etc. In this sense, rent is simply payment for the use of any natural or other commodity. When, however, the word rent is used, without explanation, in political economy, it means invariably only the price paid to a landlord for the natural and undestructible powers of the soil. The word "soil," however, must not be taken too strictly. It is meant to include all the surface of the earth and that which is beneath or within the soil. It includes all the "natural" advantages of the earth, unimproved by labor. It includes, therefore, mines, streams, water-power, harbors (so far as they are natural), and what is often of greatest importance, it includes the natural advantages of situation, as land for example in the heart of a great city, or at the corner of two great thoroughfares.

Such being the economic use of the word, we pass on to consider the laws and principles which affect rent, and how these are variously conceived by representative writers.

Rent appears on the pages of Adam Smith's *Wealth of Nations* almost incidentally, and not always consistently treated. It is considered as "naturally a monopoly price" (bk. i. chap. xi. pp. 66-67 a) to be taken as a matter of course rather than to be explained. Adam Smith says elsewhere, "as soon as the land of any country has all become private property, the landlords, like all other men, love to reap where they never sowed, and demand a rent even for its natural production" (bk. i. chap. vi. p. 23 a). Rent, he argues, depends on prices; the fact that the rent of land varies with its fertility and situation he treats as an obvious commonplace, needing little consideration. We have here some of the elements of the Ricardian doctrine of rent, but wholly undeveloped. Beginning,

Adam Smith,

however, with Anderson and continuing through Buchanan, Malthus, and Ricardo, we have the development of that theory of rent, which is usually associated with Ricardo's name and has played so large a part in economic science (see RICARDO). It is not, however, Ricardo's. Dr. Ingram, in his *History of Political Economy*, says Ricardo

"distinctly states in the preface to the *Principles*, that 'in 1835 Mr. Malthus, in his *Inquiry into the Nature and Progress of Rent*, and a fellow of University College, Oxford, in his *Essay on the Application of Capital to Land*, presented to the world, nearly at the same moment, the true doctrine of rent.' The second writer here referred to was Sir Edward West, afterward a judge of the supreme court of Bombay. Still earlier than the time of Malthus and West, as M'Culloch has pointed out, this doctrine has been clearly conceived and fully stated by Dr. James Anderson in his *Inquiry into the Nature of Corn Laws*, published at Edinburgh in 1777. That this tract was unknown to Malthus and West we have every reason to believe; but the theory is certainly as distinctly enunciated and as satisfactorily supported in it as in their treatises; and the whole way in which it is put forward by Anderson strikingly resembles the form in which it is presented by Ricardo."

It is this theory which has entered into all modern discussions and affected the theory of wages and profits and lies at the basis, not only of the *laissez-faire* economics, but of Henry George's Single Tax and most modern socialism. John Stuart Mill says of this theory:

"It is one of the cardinal doctrines of political economy; and until it was understood, no consistent explanation could be given of many of the more complicated industrial phenomena."

Of the critics of the theory, Mills says:

"A remark is often made, which must not be omitted here, tho, I think, more importance has been attached to it than it merits. Under the name of rent, many payments are commonly included which are not a remuneration for the original powers of the land itself, but for capital expended on it. The additional rent which land yields in consequence of this outlay of capital should, in the opinion of some writers, be regarded as profit, not rent. But before this can be admitted, a distinction must be made. The annual payment by a tenant almost always includes a consideration for the use of the buildings on the farm; not only barns, stables, and other out-houses, but a house to live in, not to speak of fences and the like. The landlord will ask, and the tenant will give, for these whatever is considered sufficient to yield the ordinary profit, or rather (risk and trouble being here out of the question) the ordinary interest, on the value of the buildings; that is, not on what it has cost to erect them, but on what it would now cost to erect others as good; the tenant being bound, in addition, to leave them in as good repair as he found them, for otherwise a much larger payment than simple interest would of course be required from him. These buildings are as distinct a thing from the farm as the stock or the timber on it; and what is paid for them can no more be called rent of land than a payment for cattle would be, if it were the custom that the landlord should stock the farm for the tenant. The buildings, like the cattle, are not land, but capital, regularly consumed and reproduced; and all payments made in consideration of them are properly interest."

"But with regard to capital actually sunk in improvements, and not requiring periodical renewal, but spent once for all in giving the land a permanent increase of productiveness, it appears to me that the return made to such capital loses altogether the character of profits, and is governed by the principles of rent."

"Some writers, in particular Mr. H. C. Carey, take away still more completely than I have attempted to do the distinction between these two sources of rent, by rejecting one of them altogether and considering all rent as the effect of capital expended. In proof of this Mr. Carey contends that the whole pecuni-

ary value of all the land in any country, in England, for instance, or in the United States, does not amount to anything approaching to the sum which has been laid out, or which it would even now be necessary to lay out, in order to bring the country to its present condition from a state of

Carey's Views.

primeval forest. This startling statement has been seized on by M. Bastiat and others as a means of making out a stronger case than could otherwise be made in defense of property in land. Mr. Carey's proposition, in its most obvious meaning, is equivalent to saying that if there were suddenly added to the lands of England an unclaimed territory of equal natural fertility, it would not be worth the while of the inhabitants of England to reclaim it; because the profits of the operation would not be equal to the ordinary interest on the capital expended. To which assertion, if any answer could be supposed to be required, it would suffice to remark that land not of equal but of greatly inferior quality to that previously cultivated is continually reclaimed in England, at an expense which the subsequently accruing rent is sufficient to replace completely in a small number of years. The doctrine, moreover, is totally opposed to Mr. Carey's own economical opinions. No one maintains more strenuously than Mr. Carey the undoubted truth that, as society advances in population, wealth, and combination of labor, land constantly rises in value and price. This, however, could not possibly be true if the present value of land were less than the expense of clearing it and making it fit for cultivation; for it must have been worth this immediately after it was cleared, and according to Mr. Carey it has been rising in value ever since. When, however, Mr. Carey asserts that the whole land of any country is not now worth the capital which has been expended on it, he does not mean that each particular estate is worth less than what has been laid out in improving it, and that, to the proprietors, the improvement of the land has been, on the final result, a miscalculation. He means, not that the land of Great Britain would not now sell for what has been laid out upon it, but that it would not sell for that amount plus the expense of making all the roads, canals, and railways. This is probably true, but is no more to the purpose, and no more important in political economy, than if the statement had been that it would not sell for the sums laid out upon it plus the national debt, or plus the cost of the French Revolutionary war, or any other expense incurred for a real or imaginary public advantage. The roads, railways, and canals were not constructed to give value to land; on the contrary, their natural effect was to lower its value by rendering other and rival lands accessible; and the landholders of the southern counties actually petitioned Parliament against the turnpike roads on this very account. The tendency of improved communications is to lower existing rents by trenching on the monopoly of the land nearest to the places where large numbers of consumers are assembled. Roads and canals are not intended to raise the value of the land which already supplies the markets, but (among other purposes) to cheapen the supply by letting in the produce of other and more distant lands; and the more effectually this purpose is attained the lower rent will be. If we could imagine that the railways and canals of the United States, instead of only cheapening communication, did their business so effectually as to annihilate cost of carriage altogether, and enable the produce of Michigan to reach the market of New York as quickly and as cheaply as the produce of Long Island—the whole value of the land of the United States (except such as lies convenient for building) would be annihilated; or, rather, the best would only sell for the expense of clearing, and the government tax of a dollar and a quarter per acre; since land in Michigan, equal to the best in the United States, may be had in unlimited abundance by that amount of outlay. But it is strange that Mr. Carey should think this fact inconsistent with the Ricardo theory of rent. Admitting all that he asserts, it is still true that as long as there is land which yields no rent, the land which does not yield rent does so in consequence of some advantage which it enjoys, in fertility or vicinity to markets, over the other; and the measure of its advantage is also the measure of its rent. And the cause of its yielding rent is that it possesses a natural monopoly; the quantity of land, as favorably circumstanced as itself, not being sufficient to supply the market. The propositions constitute the theory of rent laid down by Ricardo, and if

they are true, I cannot see that it signifies much whether the rent which the land yields at the present time is greater or less than the interest of the capital which has been laid out to raise its value, together with the interest of the capital which has been laid out to lower its value."

Professor Marshall, representing the later political economy, accepts the Ricardian theory in the main, but with some qualifications. He states his view thus (*Economics of Industry*, bk. ii. chap. iii.):

"Suppose a farmer to have £500 which he is thinking of applying in extra cultivation of his farm, and to have calculated that it will only just answer his purpose to do so. He has calculated, that is, that if he applies this extra £500 he will, after paying for labor, seed, taxes, etc., get an extra net produce of the value of £40; *i. e.*, at the rate of 8 per cent. on the extra outlay. This is, we suppose, just sufficient to remunerate him; so that if he expected to get less, the chance of the improvement turning out unsuccessful and the prospect of additional trouble in working it, would induce him to invest the money in railroad stock or some other securities.

"He hears at this time that a small adjacent farm of 50 acres is to let, and he is asked what rent he would be willing to pay for it. His £500 would be just enough for working this farm, and he could work it with the same trouble that it would give him to apply the extra £500 to the farm he already has. He calculates that taking one year with another he may expect to get from it £100 worth of net profit after paying for labor, seed, taxes, etc.

"So he will pay just £60 rent for the use of this land. If he can get the land for this he will take it; but he will not give any more for it, and it will not be likely to be worth any one else's while to offer more. So the landlord cannot get more than this for it. If he puts up the farm to competition and plays off one farmer against another, he may just get £60: and this is then the competition rent, or, as it is sometimes called, the economic rent of the farm. Many disturbing circumstances, such as custom, the absence of an active spirit of competition on the part of the farmers, generosity or sluggishness on the part of the landlord may cause the actual rent to be less than this. But £60 is the rent that will be obtained if there is a perfectly good market for the hire of the land; that is, if on the one hand the landlord exerts himself to get the best rent he can for the land, and, on the other hand, there are competent men in the neighborhood who are ready to rent farms.

"This illustration shows us that the economic rent of a piece of land is found by subtracting from the value of its annual produce an amount sufficient to return the farmer's outlay with profits.

"Of course allowance must be made for the risk of bad harvests. This is done by assuming that the harvest is an average one. It must also be supposed that the farmer has neither more nor less skill and enterprise than most others in his neighborhood, or, as we may say, that he is an average farmer. The rent, then, is the surplus return which the land gives in an average harvest, after repaying the average farmer's outlay with profits, provided he has applied so much capital to it as to make this surplus return as large as he can. If he has applied less than this amount of capital some one else who intends to apply more than he has done, and thus obtain a larger surplus return, may offer to pay a higher rent.

"Further, the above illustration shows that the amount of produce which a farmer must retain, in order to be remunerated for his outlay, can be discovered by observing what amount of additional return is just sufficient to induce him, or another farmer in the same neighborhood, to apply extra capital to his land. . . .

"It may happen that there is in the neighborhood land for which no rent can be obtained, because the return to the capital applied to this land remunerates, but only just remunerates, the farmer. In this case we may say that the amount of produce which a farmer must retain, in order to be remunerated for his outlay, is equal to the produce that could be raised by the same amount of capital from an adjacent piece of land that pays no rent, but yet is cultivated.

"The law of rent may therefore be stated thus: The rent of a piece of land is the excess of its produce over

Economic Rent.

the produce of an adjacent piece of land which is cultivated with an equal amount of capital, and which would not be cultivated at all if rent was demanded for it."

Of one important deduction from the Ricardian law of rent Professor Fawcett has made a clear explanation. He says (*Manual of Political Economy*, bk. ii. chap. iii.):

"From Ricardo's theory of rent there can be deduced the very important proposition, that rent is not an element of the cost of obtaining agricultural produce. A no less eminent writer than the late Mr. Buckle has assured his readers that the proposition just stated can only be grasped by a comprehensive thinker; we, however, believe that it may be made very intelligible by a simple exposition. If rent is not an element of cost of production, food would be no cheaper if all land were arbitrarily made rent free. Let us, therefore, inquire if this would be the case. It has been frequently stated in this chapter that there is always some land in cultivation so poor that it can only afford to pay a nominal rent; the produce it yields being no more than sufficient to reimburse the expenses of cultivation.

"Let us now suppose that all land is made rent-free by an arbitrary edict of the Government. Such an act of spoliation, altho it would unjustly interfere with property, would not cause any diminution in the consumption of food; the same quantity of agricultural produce would be required as before; the same area of land would, therefore, have to be cultivated. That land would still require to be tilled which previously only paid a nominal rent; but if food was rendered cheaper, by making land rent-free, this land, which before only paid nominal rent, would be cultivated at a loss. No person, however, will continue to apply his labor and capital if he does not obtain in return the ordinary rate of profit, and, therefore, if food became cheaper, such land as we have just described would cease to be cultivated; but this cannot be, because the demand of the country for food is such that the produce which this land yields cannot be dispensed with. It is therefore manifest that food would not become cheaper, even if land were made rent-free. Rent consequently is not an element in the cost of production. The value of food is, *ceteris paribus*, determined by the demand for it, because the demand for food regulates the margin of cultivation. Altho the payment of rent does not influence the cost of producing food, yet the amount of rent paid indicates the position of the margin of cultivation, and the value of food must rise as this margin of cultivation descends."

(For a discussion of this, see PRODUCTION. For the facts of modern rent and the important part played by rent in commercial and industrial life, and for land reforms, see articles LAND, and SINGLE TAX.

REPUBLICAN PARTY, THE.—The Republican party was formed to oppose the extension of slavery. The policy of compromise of the Whig party (*q. v.*) no longer satisfied the strong sentiment against slavery that had sprung up in the free States, and the Whigs met with utter defeat in the elections of 1852. The Free-soil party (*q. v.*) had obtained prominence in the election of 1848, and became the natural predecessor of the Republican party. Events favored a new party.

The Democrats, during the administration of President Pierce, took the important step of repealing "the Missouri Compromise." Under this law Kansas, which lay north of the parallel of 36° 30', would have been, of necessity, a free Territory. But the Kansas-Nebraska bill, which repealed the compromise, was passed by Congress in 1854. It asserted the principle of non-intervention by Congress with slavery in States or Territories. Thus all the public domain was left open to slavery,

and, in Kansas, anarchy and civil war followed. The slave-holders and the free-state party fought with each other for the control of the Territory. In 1859 Kansas finally adopted a constitution which excluded slavery, but she was not admitted to the Union as a State till 1861, when the Republicans had come into power. There was felt to be need of a new party, which should take up the old Federal and Whig policy, favoring a strong Federal government and protection, but utterly opposed to slavery. The Michigan State Convention of 1854 is generally admitted to have first used the name Republican, from a suggestion of Horace Greeley (*q. v.*), but it was quickly caught up, and, in 1854, enough "Republicans" were elected to Congress to control the House and choose Nathaniel Banks speaker.

The first Republican National Convention was held at Pittsburg, February 22, 1856; the first nominating convention at Philadelphia, June 18, 1856. The plan was to unite in one organization the opponents of the proslavery Democracy, without regard to former party ties. Hence, the new organization was made up of antislavery Whigs, whom the Kansas-Nebraska bill had driven from the party, of Abolitionists, Independent Democrats, and, in fact, of all those who were opposed to the extension of slavery. The platform adopted was reported by David Wilmot, and denied that there was any authority competent to give legal existence to slavery in any Territory of the United States. The only planks not referring to slavery favored national aid to a Pacific Railway and liberal river and harbor appropriations. John C. Fremont of California was nominated for President, and W. D. Dayton for Vice-President. The leading rival to Dayton was Abraham Lincoln. The result of the elections greatly encouraged the new party, for, altho Buchanan, the Democratic candidate, was elected, Fremont had a large plurality over him on the popular vote, and 114 electoral votes.

Public sentiment in favor of Republican principles continued to grow, and events favored the party. The Dred-Scott decision of the Supreme Court in 1857 intensified Northern feeling. It made void all prohibitions of slavery in the public domain, and recognized the right of every citizen to carry slaves there. During Buchanan's administration the Southern leaders were preparing for secession. On the other hand, the famous Douglass-Lincoln debate in 1859 helped to commit the Republican party to a refusal of all compromise, while the John Brown raid had a strong influence on the public mind of the North.

Campaign of 1860.

The antislavery sentiment became thoroughly consolidated, and the Democrats hopelessly split. The Republican Convention met at Chicago, and nominated Abraham Lincoln for the Presidency, and Hannibal Hamlin for Vice-President. William H. Seward of New York had been the first choice of many, but some in the East, led by Greeley, with the Western men, nominated

Lincoln. He was triumphantly elected with 180 electoral votes.

In their platform the Republicans declared the new dogma, that the Constitution of its own force carries slavery into any or all of the Territories of the United States, to be a dangerous political heresy. They reaffirmed the positions of the convention of 1856. A declaration was made also in favor of such an adjustment of imports as to encourage the development of the industrial interests of the whole country—the party thus definitely committing itself to a policy of protection.

Soon after the election South Carolina passed an ordinance of secession, and other Southern States quickly followed. When Lincoln was inaugurated in 1861, the government of the Confederate States of America, so called, had already been organized. The efforts of President Lincoln for reunion were fruitless, and with the bombardment of Fort Sumter by Southern troops in April, 1861, the Civil War began.

As the Republican party now controlled all branches of the Government, upon it fell the responsibility of prosecuting the war. It was distinctively the war party, tho sustained by the general sentiment of the North. In the treatment of the great questions that had to be decided its policy became settled, and its future was determined. The Morrill tariff was early enacted—a high protection measure, which successfully raised a large revenue for carrying on the war. Acts were also passed which provided for the issuing of bonds and of a legal-tender paper currency. At the end of the war the national debt amounted to \$2,700,000,000.

At first the Republicans had no intention of interfering with slavery in the rebellious States. The preservation of the Union was the aim of the war.

Slavery.

But it soon became clear to President Lincoln that, to obtain this object, slavery must be attacked. Accordingly he issued, January 1, 1863, the famous Emancipation Proclamation, by which all slaves in the rebellious States were declared free. This action was taken only "as a necessary war measure," but it was heartily indorsed by Republicans, and later enforced by civil legislation.

In June, 1864, President Lincoln was re-nominated, with Andrew Johnson of Tennessee as Vice-President, on a platform declaring it necessary that slavery should be utterly exterminated from the soil of the republic. The party pronounced in favor of continuing the struggle with the South until it should submit. The Democrats, on the other hand, declared that efforts should be made for a cessation of hostilities. The elections of 1864 resulted in the indorsement of the Republican policy, and President Lincoln secured 212 out of 233 electoral votes. Soon after his second inauguration the main army of the Confederacy surrendered to General Grant at Appomattox.

The work of reconstruction had now to begin, and it was known that President Lincoln would pursue a liberal policy toward the rebellious States. But on April 15 he was assassinated.

His loss plunged the nation into mourning, and deprived his party of its greatest leader.

An amendment to the Constitution—the Thirteenth—abolishing slavery, was passed by Congress, and finally became a law December 18, 1865. The Fourteenth Amendment, which gave citizenship to the negro, was submitted to the people in June, 1866, and became a law July 28, 1868. Vice-President Johnson, who succeeded Lincoln, quarreled with the Republican party in Congress, and was finally impeached. But on his trial before the Senate, the votes for conviction lacked one of the necessary two-thirds. Notwithstanding the veto of the President, a Reconstruction Act was passed March 2, 1867, admitting the seceded States to their former standing in the Union under certain conditions. Each State, for example, was obliged to adopt the Fourteenth Amendment, and to elect representatives who had not been concerned in the rebellion. President Johnson favored less stringent conditions. Under such provisions the seceded States were restored to their former position, so that all but three of them took part in the campaign of 1868, when the Republicans nominated and elected General Grant and Schuyler Colfax.

Early in Grant's administration the Fifteenth Amendment, which gave the suffrage to the negro, was adopted March 30, 1870. This was a purely Republican measure, and was generally opposed by the Democrats. To insure the carrying out of its provisions in the South, additional legislation was passed in 1871, and again in the next Congress—the Forty-second—the so-called Force Bill was enacted. This legislation greatly increased the powers of the Federal courts and officers, and also of the President. The Democrats being more numerous in the Forty-second Congress than in the previous ones, brought forward an Amnesty bill. Under a compromise with the Republicans it was finally passed May 22, 1872, certain prominent Confederate leaders being excepted. Grant's administration was dissatisfactory to many Republicans who connected it with "carpetbag" corruption in the South and connivance with political scandals in the North. As a result, a Liberal Republican convention met and nominated Horace Greeley and B. Gratz Brown, the nomination being accepted by the Democrats. The regular Republicans nominated Grant, with Henry Wilson for Vice-President. The platform contained declarations in favor of civil-service reform, of a speedy return to specie payments, and against any repudiation of public debts. General Grant was reelected. His second term was marked by the struggle over the "inflation" policy, which was that of issuing more paper money and postponing a return to specie payments (see CURRENCY). Trouble having arisen in Louisiana from the existence of two State governments, Congress recognized the Kellogg, or Republican government.

Owing partly to the corruption in office that had been for some years prevalent, the Demo-

General Grant.

cratic party developed great strength in the elections of 1876, and both sides claimed the victory, the Republicans having nominated R. B. Hayes and W. A. Wheeler, the Democrats S. J. Tilden and T. A. Hendricks. The Democrats unquestionably had the majority of the popular votes. The House of Representatives having now a Democratic majority, some compromise between the parties had to be effected. An electoral commission was agreed upon which, by a strictly party vote, declared Hayes, the Republican candidate, to have 185 votes, and Tilden 184. By this decision bloodshed was probably averted. President Hayes was not in full accord with his party, owing to his policy of concession to the South, and of civil-service reform. Nevertheless he withstood the attempts of the Democratic House to force a modification of Federal election supervision by adding political riders to appropriation bills. The most notable act of his administration was the resumption of specie payments on January 1, 1879.

Campaign of 1876.

In 1880 the Republicans nominated James A. Garfield of Ohio and Chester A. Arthur of New York, and succeeded in electing their candidates. In the respective platforms of the parties the question of the tariff comes into prominence. The Garfield-Conkling quarrel followed the new President's inauguration, and soon after this occurred the assassination of Garfield, and the administration of President Arthur, who succeeded to the Presidential chair. His policy was acceptable to the Republican party; nevertheless, James G. Blaine was nominated for the Presidency in 1884, in preference to him, with General Logan for Vice-President. The issues were largely the same as before; yet, for various reasons, the principal among which was the opposition to Blaine of ex-Senator Conkling in New York, the Democratic candidate, Cleveland, was elected.

The executive department of the Government had been controlled by the Republicans for 24 years. Now they had only the Senate, the House being Democratic. Under the circumstances, however, no Democratic measures could be enacted. Yet the Mills bill, a radical tariff-reform measure, passed the House of Representatives, and the tariff became the leading issue of 1888. The Democratic party declared for radical reform of the tariff on the basis of less protection, and renominated President Cleveland. The Republicans asserted the necessity of a policy of "protection to home industry." The Republican candidates, Benjamin Harrison and Levi P. Morton, received 233 electoral votes to Cleveland's 168, and the party also secured the House of Representatives.

During the Fifty-first Congress, the Republicans, being in power in all branches of the Government, passed a number of important bills. First among them is the so-called McKinley tariff bill, which enacted a high tariff. The McKinley bill became a law, October 1, 1890. The Dependent Pension bill, largely increasing the class of pensioners, and a silver

bill, providing for the purchase of silver, and the issue of Treasury notes thereon, were passed. Parliamentary practise in the House was reformed by the rulings of Speaker Reed. In 1890, however, the Democrats secured a large majority in the House, and Republican legislation ceased with the expiration of this Congress.

The Presidential campaign of 1892 was hotly contested and the issue, as before, was chiefly the tariff, the Democratic convention going so far as to declare all protection unconstitutional. The Republicans renominated General Harrison, with Whitelaw Reid for Vice-President.

Campaign of 1892.

The result of the struggle was the election of Mr. Cleveland. The House and Senate being now in its hands as well, the Democratic party had full control of the Government for the first time since before the war. Its most important legislation has been the so-called Wilson bill, a tariff measure which lowered duties, and put many articles on the free list. It was, however, so altered by conservative Democrats in the Senate, that President Cleveland repudiated all responsibility for it, and it became a law without his signature. A terrible wave of depression in business came over the country early in the year 1893 and has not yet passed (1896). As a result, in the elections of November, 1894, when the Democratic tariff legislation was the issue, the Republicans won an overwhelming victory, and secured the next House of Representatives by a large majority.

For the campaign of 1896, the Republican party managers thought it best to make the tariff the issue, and consequently Mr. McKinley, the stoutest Protectionist, was generally favored, and by astute political maneuvering received the support of the majority of the representatives elected by the States to the St. Louis convention of June 18, and was there nominated for the Presidency on the first ballot, with Mr. Hobart of New Jersey for Vice-President. Meanwhile the silver issue (see SILVER) more and more forced itself upon the attention of the country and became the engrossing theme in all conventions. The gold monometallists being in a large majority at St. Louis, some of the silver delegates, headed by Senator Teller, bolted the convention and issued a declaration to the country, condemning the Republican party as selling the interests of the producers of the country to the interests of the "gold bugs" of Wall Street. (See SILVER.) For the platform adopted at St. Louis see Appendix.

REPRESENTATIVES, HOUSE OF, IN THE UNITED STATES.—The United States Constitution says of the House of Representatives :

"ART. I, SEC. 2. The House of Representatives shall be composed of members chosen every second year by the people of the several States, and the electors in each State shall have the qualifications requisite for electors of the most numerous branch of the State legislature.

"No person shall be a Representative who shall not have attained the age of twenty-five years, and been

seven years a citizen of the United States, and who shall not, when elected, be an inhabitant of that State in which he shall be chosen.

"[Representatives and direct taxes shall be apportioned among the several States which may be included within this Union, according to their respective numbers, which shall be determined by adding to the whole number of free persons, including those bound to service for a term of years, and excluding Indians not taxed, three-fifths of all other persons.]* The actual enumeration shall be made within three years after the first meeting of the Congress of the United States, and within every subsequent term of ten years, in such manner as they shall by law direct. The number of Representatives shall not exceed one for every 30,000, but each State shall have at least one Representative; and until such enumeration shall be made, the State of New Hampshire shall be entitled to choose three, Massachusetts eight, Rhode Island and Providence Plantations one, Connecticut five, New York six, New Jersey four, Pennsylvania eight, Delaware one, Maryland six, Virginia ten, North Carolina five, South Carolina five, and Georgia three.

"When vacancies happen in the representation from any State, the executive authority thereof shall issue writs of election to fill such vacancies.

"The House of Representatives shall choose their Speaker and other officers; and shall have the sole power of impeachment."

(For articles bearing both on the Senate and the House, see article CONGRESS.)

Article xiv. of the Amendments, Section 2, Clause 1, says: "Representatives shall be apportioned among the several States according to their respective numbers, counting the whole number of persons in each State, excluding Indians not taxed."

The original Constitution included in this basis of representation three-fifths of the slaves. Here was one of the compromises between the free States and the slave States in the formation of the Constitution.

The first Congress went into operation March 4, 1789; the members of the House holding their seats for two years. On the 4th of March, therefore, in every second year,—in other words, in all the odd years,—a new Congress begins its term.

The number of representatives, which is fixed by a law of Congress once in 10 years, has increased from 65, in 1789, to 360 for the decade 1893 to 1903. The population for one representative has increased from 33,000 in 1789 to 173,901, in 1893.

The salary of representatives is \$5000 a year, \$125 a year additional for stationery, and mileage at the rate of 20 cents a mile to and from Washington at every session of Congress. Unexcused absence causes a deduction from the salary. The House of Representatives chooses its Speaker and other officers. The power of the Speaker is enormous. Unless otherwise ordered by the House (which is seldom the case) he appoints all committees, and the method of the House in transacting its business renders the committees of first importance. All measures are referred to the standing committees, and their power over the life or death of a bill is practically unlimited. A majority of the members elected constitutes a quorum. The House has sole power of impeachment; all bills for raising revenue must originate in the House, and on it falls the duty of electing the President

* The clause included in brackets is amended by the XIVth Amendment, 2d section.

of the United States when the vote of the electors fails to result in a choice.

* Without a vote.

The Speaker is the presiding officer of the House, and the other officers are: (1) clerk; (2) sergeant-at-arms; (3) door-keeper; (4) postmaster; (5) chaplain.

The following critical review of the House is condensed from Professor Bryce's *The American Commonwealth* (chaps. 13 and 14):

"The House of Representatives, usually called for shortness the House, represents the nation on the basis of population, as the Senate represents the States.

"But even in the composition of the House the States play an important part. . . Congress allots so many members of the House to each State. . . leaving the States to determine the districts within its own area for and by which the members shall be chosen. These districts are now equal, or nearly equal, in size; but in laying them out there is ample scope for the process called 'gerrymandering' (*q. v.*), which the dominant party in a State rarely fails to apply for its own advantage. Where a State legislature has failed to redistribute the State into congressional districts, after the State has received an increase of representatives, the additional member or members are elected by the voters of the whole State on a general ticket, and are called 'representatives at large.'

"Setting extraordinary sessions aside, every Congress has two sessions, distinguished as the First, or Long, and the Second, or Short. The long session begins in the fall of the year after the election of a

Congress, and continues, with a recess at Christmas, till the July or August following. The short session begins in the December after the July adjournment, and lasts till the 4th of March following. The whole working life of a House is thus from 10 to 12 months. Bills do not, as in the English Parliament, expire at the end of each session; they run on from the long session to the short one. All, however, that have not been passed when the fatal 4th of March arrives perish forthwith, for the session, being fixed by statute, cannot be extended at pleasure. There is consequently a terrible scramble to get business pushed through in the last week or two of a Congress.

"The number of bills brought into the House every year is very large, averaging over 7000. In the Thirty-seventh Congress (1861-63) the total number of bills introduced was 1026, viz.: 613 House bills, and 433 Senate bills. In the Forty-sixth it had risen to 9481, of which 7257 were House bills, 2224 Senate bills; showing that the increase has been much larger in the House than in the Senate. In the Forty-ninth Congress (1885-87) the number was rising still further, the number up to July, 1886, being 12,906, exclusive of 277 joint resolutions. In the British House of Commons the total number of bills introduced was, in the session of 1885, 481, of which 202 were public, and 279 private bills. America is, of course, a far larger country, but the legislative competence of Congress is incomparably smaller than that of the British Parliament, seeing that the chief part of the field, both of public bill and private bill legislation, belongs in America to the several States. By far the larger number of bills in Congress are what would be called in England 'private' or 'local and personal' bills; *i. e.*, they establish no general rule of law, but are directed to particular cases. Such are the numerous bills for satisfying persons with claims against the Federal Government, and for giving or restoring pensions to individuals alleged to have served in the Northern armies during the War of Secession. It is only to a very small extent that bills can attempt to deal with ordinary private law, since nearly the whole of that topic belongs to State legislation. It is needless to say that the proportion of bills that pass to bills that fail is a very small one; not one-thirtieth. One is told in Washington that few bills are brought in with a view to being passed. They are presented in order to gratify some particular persons or places, and it is well understood in the House that they must not be taken seriously. The Speaker has immense political power, and is permitted, nay expected, to use it in the interests of his party. In calling upon members to speak he prefers those of his own side. He decides in their favor such points of order as are not distinctly covered by the rules. His authority over the arrangement of business is so large that he can frequently advance or postpone particular bills or motions in a way which determines their fate. Although he does not figure in party debates in the House, he may and does advise the other leaders of his party privately; and when they 'go into caucus' (*i. e.*, hold a party meeting to determine their action on some pending question) he is present and gives counsel. He is usually the most eminent member of the party who has a seat in the House, and is really, so far as the confidential direction of its policy goes, almost its leader. His most important privilege is, however, the nomination of the numerous standing committees already referred to. In the first Congress (April, 1789), the House tried the plan of appointing its committees by ballot; but this worked so ill that in January, 1790, the following rule was passed: 'All committees shall be appointed by the Speaker, unless otherwise specially directed by the House.' This rule has been readopted by each successive Congress since then."

(For the working of these committees, and how bills are often practically passed or rejected by these committees of which the public knows little, rather than by Congress, see CONGRESS.)

REVENUE.—For the principles involved in problems of revenue, see FINANCE; TAXATION; FREE TRADE; PROTECTION; SOCIALISM; STATE. We give in this article an outline of the development of the revenues of the United States.

The American colonies gained their revenues in various ways: the proprietary States,

such as Pennsylvania and Delaware, paid heavy land duties to the proprietaries, raising other revenues by various direct taxes, excise, light customs, and tonnage duties. Rum, tobacco, and slaves were generally taxed. Quit-rents were a general source of revenue. In Colonial New England taxation was levied on all property without distinction.

Colonial Revenues.

An *ad valorem* 5 per cent. duty was levied on all imports. The expenses of government, except in New York, were very low. Additional expenditures were, however, frequently necessary, and the custom developed of meeting these by the issue of credit notes (see CURRENCY), and these gradually came to be relied on for the growing expenses of the colonies. The War of Independence was met by means of the issue of the Continental currency (see CURRENCY). The States contributed somewhat, but fitfully, and in small amounts. Loans were obtained from abroad. In the latter part of the war the Bank of North America was established, and loaned money to the Government. The successful management of these loans was mainly due to Robert Morris, elected Superintendent of Finances. After the close of the war and the adoption of the Constitution, Hamilton (*q. v.*), elected Secretary of the Treasury, was mainly influential, against no little opposition, in instituting a strong national policy; assuming the State debts, and funding the main portions of the national and State debts; paying a heavy interest, and yet slowly reducing the principal by import duties and by internal revenue taxes. Jefferson's administration repealed the internal taxes, but imports increased. The war of 1812 was fought under the guidance of Gallatin, by making new loans, doubling import duties, which, however, brought in little more revenue, and levying internal revenue taxes again. Treasury notes were also issued. After the war debt was renewed, and in 1834 the last debt was extinguished. The internal revenue system was repealed in 1817 and not revived until 1861. After the discharge of the debt, there was a surplus (\$337,468,819), which in 1837 Congress voted to distribute among the States in proportion to their population. Three-fourths of the amount were paid when a financial panic swept over the land (see BANKS and BANKING), and the Government was left unable to pay its ordinary bills. Once more Treasury notes were issued, and during the Mexican war loans were contracted; the import duties, however, soon repaid the Treasury again. In 1857 the tariff was lowered, the revenues were reduced, and by the close of Buchanan's administration there was a debt of \$60,000,000.

The War of Independence.

The War of Independence was met by means of the issue of the Continental currency (see CURRENCY), and these gradually came to be relied on for the growing expenses of the colonies. The War of Independence was met by means of the issue of the Continental currency (see CURRENCY). The States contributed somewhat, but fitfully, and in small amounts. Loans were obtained from abroad. In the latter part of the war the Bank of North America was established, and loaned money to the Government. The successful management of these loans was mainly due to Robert Morris, elected Superintendent of Finances. After the close of the war and the adoption of the Constitution, Hamilton (*q. v.*), elected Secretary of the Treasury, was mainly influential, against no little opposition, in instituting a strong national policy; assuming the State debts, and funding the main portions of the national and State debts; paying a heavy interest, and yet slowly reducing the principal by import duties and by internal revenue taxes. Jefferson's administration repealed the internal taxes, but imports increased. The war of 1812 was fought under the guidance of Gallatin, by making new loans, doubling import duties, which, however, brought in little more revenue, and levying internal revenue taxes again. Treasury notes were also issued. After the war debt was renewed, and in 1834 the last debt was extinguished. The internal revenue system was repealed in 1817 and not revived until 1861. After the discharge of the debt, there was a surplus (\$337,468,819), which in 1837 Congress voted to distribute among the States in proportion to their population. Three-fourths of the amount were paid when a financial panic swept over the land (see BANKS and BANKING), and the Government was left unable to pay its ordinary bills. Once more Treasury notes were issued, and during the Mexican war loans were contracted; the import duties, however, soon repaid the Treasury again. In 1857 the tariff was lowered, the revenues were reduced, and by the close of Buchanan's administration there was a debt of \$60,000,000.

The expenses of the War of the Rebellion were met partly by loans, partly by the issue of Treasury notes (see CURRENCY), in small part by direct taxes, with a large development of duties and taxes of various kinds. September, 1865, deducting the amount in the Treasury the debt of the nation was \$2,756,431,571. (For the discussions and important problems

connected with the Treasury notes, loans, etc., see CURRENCY.) The general policy followed was to replace temporary loans by long loans at lower interest. In 1870 a funding law was passed whereby the Treasury department was able to do this. Two hundred and fifty million dollars was sold at 4 per cent.; later, Mr. Sherman, as Secretary of the Treasury, sold \$737,691,550 at 4 per cent.; then a portion was continued in 1881 at 3½ per cent., and again

in 1882 a large quantity was sold at 3 per cent. After 1873, for a short period reduction of the debt was slow, but later went on more rapidly. (See DEBT.) Since 1892 financial ills have reduced the income, while expenses have not declined. The policy of keeping a gold reserve has been sustained by loans, for an account of which see SYNDICATE LOANS.

The following tables, from the reports of the Treasurer of the United States, give the best résumé of the state of the revenue since 1870:

RECEIPTS OF THE UNITED STATES GOVERNMENT—1870 TO 1895.

YEAR.	Customs.	Internal Revenue.	Direct Tax.	Public Lands.	Premiums.	Loans.	Gross Receipts.
1870.....	\$194,538,374.44	\$184,899,756.49	\$229,102.88	\$3,350,481.76	\$15,295,613.76	\$285,474,496.00	\$606,729,973.63

Year.....	339.1	382.5	-43.4	..	301.7	363.5	-61.8	..	317.0	352.1	34.1	..

The total receipts of the United States from the beginning of the Government, 1789, to 1895 have been: From customs, \$7,415,871,509; internal revenue, \$4,716,760,904; direct tax, \$28,131,994; public lands, \$289,726,501; miscellaneous, \$763,202,129; total, excluding loans, \$13,223,944,756.

The total expenditures of the United States from the beginning of the Government, 1789, to 1895 have been: For civil and miscellaneous, \$2,767,599,284; war, \$4,980,773,259; navy, \$1,327,407,789; Indians, \$309,200,401; pensions, \$1,950,403,063; interest, \$2,791,537,714; total, \$14,126,891,510.

The following table from the report of the Treasurer gives the details for the fiscal year 1894.

The revenues of the Government from all sources for the fiscal year ending June 30, 1894, were:

From internal revenue.....	\$147,111,232.81
From customs.....	131,818,530.62
From the District of Columbia.....	3,745,422.83
From fees—consular, letters patent, and land.....	2,765,699.41
From sinking fund for Pacific railways..	1,916,314.11
From sales of public lands.....	1,673,637.30
From tax on national banks.....	1,610,867.56
From sale of navy-yard lands, Brooklyn, N. Y.....	1,190,531.01
From navy pension and navy hospital funds, etc.....	1,059,964.64
From repayment of interest by Pacific railways.....	926,420.09
From profits on coinage, bullion deposits, and assays.....	870,016.78
From miscellaneous sources.....	772,148.18
From customs fees, fines, penalties, and forfeitures.....	682,041.48
From sales of Indian lands.....	399,811.36
From bequest of General Cullum for Memorial Hall, West Point.....	237,500.00
From immigrant fund.....	214,142.47
From sales of Government property.....	1,673,637.30
From Soldiers' Home, permanent fund..	191,382.15
From sale of old custom-house, Milwaukee, Wis.....	107,680.00
From deposits for surveying public lands.....	103,424.87
From sales of ordnance material.....	60,159.91
From reimbursement by International Union of American Republics.....	26,243.75
From sale of abandoned military reservations.....	22,202.14
From depredations on public lands.....	8,774.05
From sales of condemned naval vessels..	5,400.85
From tax on sealskins.....	500.00
From postal service.....	75,080,479.04
Total receipts.....	\$372,802,498.29

The expenditures for the same period were:

For the civil establishment, including foreign intercourse, public buildings, collecting the revenues, deficiency in postal revenues, refund of direct taxes, bounty on sugar, District of Columbia, and other miscellaneous expenses.....	\$101,943,884.07
For the military establishment, including rivers and harbors, forts, arsenals, and seacoast defenses.....	54,567,929.85
For the naval establishment, including construction of new vessels, machinery, armament, equipment, and improvements at navy-yards.....	31,701,293.79
For Indian service.....	10,293,481.52
For pensions.....	141,177,284.96
For interest on the public debt.....	27,841,405.64
For postal service.....	75,080,479.87
Total expenditures.....	\$442,605,758.04

For the receipts and expenditures of other nations, see the different nations.

REYBAUD, MARIE ROCHE LOUIS, was born in Marseilles in 1799. He went to Paris in 1829, and became the leading historian of the socialist school. A novelist as well as an historian, in 1850 he was elected a member of the Academy. His *Études sur les Réformations ou Socialistes Modernes* (2 vols. 1840-47) was the first work to bring the word *socialism* into general use.

RICARDO, DAVID, was born in London in 1772, the son of a Jewish member of the Stock Exchange. At the age of 14 he entered his father's office; but, when 21, he separated from his father's family and entered the Church of England. Commencing business for himself, he was a man of wealth at 25. In 1799 he became interested in Adam Smith's great work, and henceforth devoted himself mainly to economic studies. In 1809 he wrote a series of articles on monetary questions to the *Morning Chronicle*, which led to considerable controversy. In 1815 he published an essay on the Influence of the *Low Price of Corn, or the Profit of Stock*, in which he first stated the views as

to rent afterward connected with his name, but which he explicitly states he derived mainly from Malthus (see RENT). In 1817 appeared Ricardo's great work, his *Principles of Political Economy and Taxation*. In 1819 he entered Parliament, and was soon recognized as an authority in economics, and a strong supporter of the battle for free trade. In 1822 he published a tract on *Protection to Agriculture*, and in 1824 was published, after his death, his *Plan for the Establishment of a National Bank*. Ricardo died September 11, 1823, James Mill saying of him, that he knew not a better man.

Professor Ingram says of Ricardo (*History of Political Economy*):

"A sort of Ricardo-mythus for some time existed in economic circles. It cannot be doubted that the exaggerated estimate of his merits arose in part from a sense of the support his system gave to the manufacturers and other capitalists in their growing antagonism to the old aristocracy of land-owners. The same tendency, as well as his affinity to their too abstract and unhistorical modes of thought, and their eudæmonistic doctrines, recommended him to the Benthamite group, and to the so-called philosophical radicals generally. Brougham said he seemed to have dropped from heaven—a singular avatar, it must be owned. His real services in connection with questions of currency and banking naturally created a prepossession in favor of his more general views. But, apart from those special subjects, it does not appear that, either in the form of solid theoretic teaching or of valuable practical guidance, he has really done much for the world, while he admittedly misled opinion on several important questions. De Quincy's presentation of him as a great revealer of truth is now seen to be an extravagance. J. S. Mill and others speak of his 'superior lights' as compared with those of Adam Smith; but his work, as a contribution to our knowledge of human society, will not bear a moment's comparison with the *Wealth of Nations*."

Of Ricardo's views he says:

"The principle which he puts first in order, and which is indeed the key to the whole, is this—that the exchange value of any commodity, the supply of which can be increased at will, is regulated, under a régime of free competition, by the labor necessary for its production. Similar propositions are to be found in the *Wealth of Nations*, not to speak of earlier English writings. On this basis Ricardo goes on to explain the laws according to which the produce of the land and the labor of the country is distributed among the several classes which take part in production. [Professor Ingram then goes on to show where Ricardo got his theory of rent, and then says:]

"The essence of the theory is that rent, being the price paid by the cultivator to the owner of land for the use of its productive powers, is equal to the excess of the price of the produce of the land over the cost of production on that land. With the increase of population, and therefore of demand for food, inferior soils will be taken into cultivation; and the price of the entire supply necessary for the community will be regulated by the cost of production of that portion of the supply which is produced at the greatest expense. But for the land which will barely repay the cost of cultivation, no rent will be paid. Hence, the rent of any quality of land will be equal to the difference between the cost of production on that land and the cost of production of that produce which is raised at the greatest expense. . . .

"The great importance of the theory of rent in Ricardo's system arises from the fact that he makes the general economic condition of society to depend altogether on the position in which agricultural exploitation stands. This will be seen from the following statement of his theory of wages and profits. The produce of every expenditure of labor and capital being divided between the laborer and the capitalist, in proportion as one obtains more the other will necessarily obtain less. The productiveness of labor being given, nothing can diminish profit but a rise of wages, or in-

crease it but a fall of wages. Now, the price of labor, being the same as its cost of production, is determined by the price of the commodities necessary for the support of the laborer. The price of such manufactured articles as he requires has a constant tendency to fall, principally by reason of the progressive application of the division of labor to their production. But the cost of his maintenance essentially depends, not on the price of those articles, but on that of his food; and, as the production of food will in the progress of society and of population require the sacrifice of more and more labor, its price will rise; money wages will constantly rise, and with the rise of wages profits will fall. Thus it is to the necessary gradual descent to inferior soils, or less productive expenditure on the same soil, that the decrease in the rate of profit which has historically taken place is to be attributed (Smith ascribed this decrease to the competition of capitalists, tho in one place, bk. i. chap. ix., he had a glimpse of the Ricardian view). This gravitation of profits toward a minimum is happily checked at times by improvements of the machinery employed in the production of necessaries, and especially by such discoveries in agriculture and other causes as reduce the cost of the prime necessary of the laborer; but, here again, the tendency is constant. While the capitalist thus loses, the laborer does not gain: his increased money wages only enable him to pay the increased price of his necessaries, of which he will have no greater and probably a less share than he had before. In fact, the laborer can never for any considerable time earn more than what is required to enable the class to subsist in such a degree of comfort as custom has made indispensable to them, and to perpetuate their race without either increase or diminution. That is the 'natural' price of labor; and if the market rate temporarily rises above it, population will be stimulated, and the rate of wages will again fall. Thus, while rent has a constant tendency to rise and profit to fall, the rise or fall of wages will depend on the rate of increase of the working classes. For the improvement of their condition, Ricardo thus has to fall back on the Malthusian remedy, of the effective application of which he does not, however, seem to have much expectation. The securities against a superabundant population to which he inclines are the gradual abolition of the poor-laws—for their amendment would not content him—and the development among the working classes of a taste for greater comforts and enjoyments.

"It will be seen that the socialists have somewhat exaggerated in announcing, as Ricardo's 'iron law' of wages, their absolute identity with the amount necessary to sustain the existence of the laborer and enable him to continue the race. He recognizes the influence of a 'standard of living' as limiting the increase of the numbers of the working classes, and so keeping their wages above the lowest point. But he also holds that, in long-settled countries, in the ordinary course of human affairs, and in the absence of special efforts restricting the growth of population, the condition of the laborer will decline as surely, and from the same causes, as that of the landlord will be improved."

"RINGS."—The New York *Nation* (xiii. 333) says "a [political] ring is, in its common form, a small number of persons who get possession of an administrative machine and distribute the offices or other good things connected with it among a band of fellows of greater or less dimensions, who agree to divide with them whatever they make." The most famous rings in America have been the Tweed ring (*q. v.*), the Whisky ring, and the Philadelphia gas ring. To the Philadelphia gas ring, which he treats as a typical ring, Professor Bryce devotes an especial chapter in his *American Commonwealth*. According to this account the Republican party in Pennsylvania during the war fell into the control of obscure and corrupt citizens, in part, at least, because the best citizens were absorbed in national issues. A clique developed with ramifications

Wages
and
Profit.

at Washington, Harrisburg, and Philadelphia. In the latter city they gave it complete control. Says Mr. Bryce:

"They sometimes placed men of good social standing in the higher posts, but filled the inferior ones, which were very numerous, with their own creatures. The water department, the highway department, the tax department, the city treasurer's department, the county commissioner's office, fell into their hands. A mayor appointed by them filled the police with their henchmen till it became a completely partizan force. But the center of their power was the gas trust, administered by trustees, one of whom, by his superior activity and intelligence, secured the command of the whole party machinery, and reached the high position of recognized Boss of Philadelphia. This gentleman, Mr. James M'Manes, having gained influence among the humbler voters, was appointed one of the gas trustees, and soon managed to bring the whole of that department under his control. It employed (I was told) about 2000 persons, received large sums, and gave out large contracts. Appointing his friends and dependents to the chief places under the trust, and requiring them to fill the ranks of its ordinary workmen with persons on whom they could rely, the Boss acquired the control of a considerable number of votes and of a large annual revenue. He and his confederates then purchased a controlling interest in the principal horse-car (street tramway) company of the city, whereby they became masters of a large number of additional voters. All these voters were of course expected to act as 'workers,' *i. e.*, they occupied themselves with the party organization of the city, they knew the meanest streets and those who dwell therein, they attended and swayed the primaries, and when an election came round, they canvassed and brought up the voters. Their power, therefore, went far beyond their mere voting strength, for a hundred energetic 'workers' mean at least a thousand votes. With so much strength behind them the gas ring, and Mr. M'Manes at its head, became not merely indispensable to the Republican party in the city, but in fact its chiefs, able therefore to dispose of the votes of all those who were employed permanently or temporarily in the other departments of the city government—a number which one hears estimated as high as 20,000. Nearly all the municipal offices were held by their nominees. They commanded a majority in the Select Council and Common Council. They managed the nomination of members of the State legislature. Even the Federal officials in the custom-house and post-office were forced into a dependent alliance with them, because their support was so valuable to the leaders in Federal politics that it had to be purchased by giving them their way in city affairs. There was no getting at the trust, because 'its meetings were held in secret, its published annual report to the city councils was confused and unintelligible, and (as was subsequently proved) actually falsified.* Mr. M'Manes held the pay rolls under lock and key, so that no one could know how many employees there were, and it was open to him to increase their number to any extent. The city councils might indeed ask for information, but he was careful to fill the city councils with his nominees, and to keep them in humor by a share of whatever spoil there might be, and still more by a share of the patronage. . . .

* See *Report of the Committee of One Hundred*, published November, 1834. A leading citizen of Philadelphia, from whom I have sought an explanation of the way in which the gas trust had managed to intrench itself, writes me as follows: "When in 1835 gas was first introduced in Philadelphia, it was manufactured by a private company, but the city reserved the right to buy out the stockholders. When this was done, in 1841, with the object of keeping the works 'out of politics,' the control was vested in a board of twelve, each serving for three years. These were constituted trustees of the loans issued for the construction and enlargement of the works. Their appointment was lodged in the hands of the city councils; but when, on more than one occasion, the councils endeavored to obtain control of the works, the courts were appealed to and decided that the board, as trustees for the bondholders, could not be interfered with until the last of the bonds issued under this arrangement had matured and had been paid off. Thirty-year loans under these conditions were issued until 1855, so that it was not until 1855 that the city was able to break within the charmed circle of the trust."

"But how was reform to be effected? Three methods presented themselves. One was to proceed against the gas trustees and other speculators in the courts of the State. But to make out a case the facts must first be ascertained, the accounts examined. . . . The powers which should have scrutinized them, and compelled a fuller disclosure, were vested in the councils of the city, acting by their standing committees. . . . But these councils were mainly composed of members or nominees of the ring, who had a direct interest in suppressing inquiry, because they either shared the profits of dishonesty or had placed their own relatives and friends in municipal employment by bargains with the speculating heads of departments. They therefore refused to move, and voted down the proposals for investigation made by a few of their more public-spirited colleagues.

"Another method was to turn out the corrupt officials at the next election. The American system of short terms and popular elections was originally due to a distrust of the officials, and expressly designed to enable the people to recall misused powers. The astuteness of professional politicians had, however, made it unavailable. Good citizens could not hope to carry candidates of their own against the tainted nominees of the ring, because the latter, having the 'straight' or 'regular' party nominations, would command the vote of the great mass of ordinary party men, so that the only effect of voting against them would at best be to let in the candidates of the opposite, *i. e.*, the Democratic party. These candidates were usually no better than the Republican ring. . . . The third avenue to reform lay through the action of the State legislature. . . . But this avenue was closed even more completely than the other two by the control which the city ring exercised over the State legislature. The Pennsylvania House of Representatives was notoriously a tainted body, and the Senate no better, or perhaps, as some think, worse."

Only by a long, desperate struggle of the better citizens, who were aroused to disgust, was the ring finally overthrown by the formation of a Committee of One Hundred, the ceaseless efforts of a few citizens, the rousing of a general feeling, leading at last to the election of a reform Democrat, and the final conviction of some of the officials in the courts. On the situation Professor Bryce quotes two eminent Philadelphians. One says:

"Those who study these questions most critically, and think the most carefully, fear more for the republic from the indifference of the better classes than the ignorance of the lower classes. We hear endless talk about the power of the labor vote, the Irish vote, the German vote, the granger vote, but no combination at the ballot box to-day is as numerous or powerful as the stay-at-home vote."

The other, Mr. Henry C. Lea, the distinguished historian, says:

"Your expression of surprise at the maladministration of Philadelphia is thoroughly justified. In existing social conditions it would be difficult to conceive of a large community of which it would appear more safe to predicate judicious self-government than ours. Nowhere is there to be found a more general diffusion of property or a higher average standard of comfort and intelligence—nowhere so large a proportion of land-owners bearing the burden of direct taxation, and personally interested in the wise and honest expenditure of the public revenue. In these respects it is almost an ideal community in which to work out practical results from democratic theories. I have often speculated as to the causes of failure without satisfying myself with any solution. It is not attributable to manhood suffrage, for in my reform labors I have found that the most dangerous enemies of reform have not been the ignorant and poor but men of wealth, of high social position and character, who had nothing personally to gain from political corruption, but who showed themselves as unfitted to exercise the right of suffrage as the lowest proletariat, by allowing their partizanship to enlist them in the support of candidates notoriously bad who happened, by control of party machinery, to obtain the 'regular' nomination. "The nearest approach which I can make to an explanation is that the spirit of party blinds many, while still more are governed by the mental inertia

which renders independent thought the most laborious of tasks, and the selfish indolence which shrinks from interrupting the daily routine of avocations."

RISK. See INTEREST.

RITCHIE, DAVID G., was born at Jedburgh, Scotland, in 1853, and received his school education there. He was graduated with honors from the University of Edinburgh in 1874, and the same year matriculated at Balliol College, at Oxford, attending, among other lectures, those of Professor T. H. Green. He was elected to an open fellowship in Jesus College, and since 1879 he has been college lecturer and tutor in logic (in the widest sense of the term).

In politics Professor Ritchie has been a Radical, largely favoring State socialism.

Besides many review articles and essays, he has written *Darwinism and Politics* (Sonnenschein, 1889); second edition, with two additional *Essays on Human Evolution* (1891); of this little book, in its original form, two unauthorized reprints (one of them under the same cover with Professor Huxley's *Administrative Nihilism*) have appeared in the United States of America; *The Principles of State Interference; Four Essays on the Political Philosophy of Mr. Herbert Spencer, J. S. Mill, and T. H. Green* (Sonnenschein, 1891); *Darwin and Hegel*, with other philosophical studies (1893).

ROADS.—The importance of good roads to a community is evident, tho not always remembered. Traffic, industry, communication, are dependent upon them.

The roads of the Roman empire were expensive and have endured, but can be improved upon by modern engineering. Twenty-nine military roads centered at Rome, and had, according to Antoninus, a total length of 52,964 Roman miles. Ancient Peru and Mexico had good roads. In the Middle Ages roads were neglected. In 1350, in England, certain roads were given to private companies, to repair and collect tolls. In the eighteenth century, in the United States, turnpikes were maintained by private companies, and this custom still remains in some places, tho with poor results. In 1796 an act of Congress authorized a road from Baltimore westward, which was completed for 650 miles.

In Europe roads to-day are very much better than in America, tho an agitation has now commenced in the United States for better roads. Where the roads are cared for by the farmers their time and money are often wasted. Civil engineering is at first expensive, but in the long run cheaper, and far better. The cost of macadamized roads varies from \$3000 to \$9000 per mile. An organization has been effected, called the National League for Good Roads, which publishes useful literature.

ROCHDALE PIONEERS, the name given to the weavers of Rochdale (England), who started the great Rochdale cooperative movement. A rainy night in November, 1843, 12 men met in the back room of a mean inn, and commenced this cooperative movement by organizing themselves as "The Rochdale Society of Equitable Pioneers." They agreed to pay 20 pence a week into a common fund, tho only a few of the 12 were able to pay their pence that evening.

They began by buying a little tea and sugar at wholesale prices, which they sold to their members at little more than cost. In a year their number had grown to 28, and they had collected £28, with which they rented a little store, and stocked it with £15 worth of flour. For their after history, and the success of the cooperative movement which has grown out of this beginning, see COOPERATION.

RODBERTUS, KARL JOHANN (or Rodbertus-Jagetzow, as he is sometimes called, from his estates), was born in 1805 at Griefswald; his father being a professor. He was educated at Berlin, Göttingen, and Heidelberg. After practising law, and traveling, he bought, in 1836, the estate of Jagetzow in Pomerania. Here he devoted himself to economic and other studies, and became prominent in Prussian politics. In June, 1848, he was for a fortnight Cabinet Minister for Public Worship and Education; but differences in opinion caused him to resign. He was elected in 1849, once for the First Chamber, and twice for the Second. Defeated as a candidate for the first North German Diet, he retired from politics, and Lassalle, who wrote him, could not induce him to combine his socialism with a political agitation. His first great work, published in 1842, *Zur Kenntnis unserer staatswirthschaftlichen Zustände*, outlines his position. He was a Ricardian, and from this position, before Marx, deduced socialistic economics. Many modern economists call him a greater socialist economist than Marx. He died on his estates, 8th December, 1875. Professor Wagner calls Rodbertus "the first, the most original, and the boldest representative of scientific socialism in Germany," and "the most distinguished theorist of the purely economic side of scientific socialism."

Rodbertus speaks of his economic theories as a "logical development of the proposition introduced into science by Smith, and established more firmly by Ricardo's school, that all commodities can only be considered economically as the product of labor, and cost nothing but labor." This proposition he places at the beginning. He argues that, however the productivity may increase, the laborers are ever thrown back by the force of trade upon a rate of wages which does not exceed the necessary subsistence. He defines rent as that income which is derived by virtue of a possession, and without labor, and he divides rent into rent from land and rent from capital. The food and means of subsistence paid to the laborers from the produce of the land are their wages, and the rest of the commodities produced are the rent retained by the owner of the land; this is land-rent. Similarly, capital-rent is all the income which remains to the capitalist after deduction of wages paid to his laborers. But all produce is the produce of labor, and with free competition the value of every commodity gravitates

toward the value of the labor expended upon it; so that the relationship between the values of the raw and manufactured products is, on the whole, only regulated by the amount of labor expended upon each. Rodbertus points out that a change in the sum of a nation's productive force; in other words, a change in the number of laborers—apart, of course, from an alteration

Economic Analysis.

in productivity, or in the division of the produce—only changes the sum of the national produce and the amounts (not the proportions) which fall to rent and wages. According as the sum of the productive forces employed increases or decreases, will more or less rent be received by the land-owners, and more or less profit by the capitalists. Wages will not be higher with increased production, because, productivity and division being supposed the same, the increased produce falling to the laborers will be shared by the larger population. There can be no rent, then, first, unless the labor produce more than is necessary in order that the laborer may continue his labor, and second, unless institutions exist for depriving the laborer of this surplus, wholly or in part, and giving it to others, who do not themselves work, since the laborer is primarily in possession of the produce of his labor. This is especially seen in the case of slave-labor, where the laborer is allowed just so much of the produce as is necessary to the continuation of his labor. In modern times the arbitrary measures of the slave-owner have been replaced by the wage system or contract; but, says Rodbertus, "this contract is only formally and not actually free, and hunger fully takes the place of the whip. What used to be called food is now called wages. . . . A very large part of the people is no longer able to live upon its own means, but is in some way or other thrown on the support of the other part of society. . . . This fact runs parallel with another equally indubitable, and making the first still more striking; the national wealth has simultaneously increased. Not only has the national income become greater, because the population has increased, and the increased population has therefore produced more; but if the increased national wealth be divided between the increased population there is a larger sum per head." These remarkable facts go together:

- (1) the impoverishment in a nation increases out of proportion to the growth of population, while simultaneously
- (2) the national income increases at greater ratio than the population, and the national wealth also tends to grow. This phenomenon Rodbertus holds to be unique in history.

The Present.

The social condition of the working classes should be raised to the level of their political condition; but all that has been done so far has been to press it lower down. Rodbertus has no patience with the egotism which, "clothing itself too often in the garb of morality," says that the vices of the working classes are the causes of their misery and of pauperism. People call out to the laborer, *Ora et labora*, and enjoin upon him the duty of temperance and providence; but the fact is, says Rodbertus, that thrift is an impossibility, and to preach thrift where there is no chance of saving is pure cant and cruelty. Not, indeed, that morality is not to be enjoined on the working classes. Morality should never cease to enforce its categorical imperative everywhere, powerless as the human will is to attain to perfection; but the policy of merely reiterating the duty of morality is useless. He who gives bread to the hungry man, he remarks, protects him far more surely from stealing than he who repeats the command, "Thou shalt not steal." Nor has he much more respect for the *laissez-faire* school of economists. He sneers at the argument of "natural laws." Only in nature do natural laws act of themselves intelligently. For society, which is not natural, laws must be made.

Rodbertus proposes to abolish the present wage-contract and to introduce in its place a normal work-day with a normal form of wages; then to introduce labor-note money, the issue of which should be entirely in the hands of the State; and finally to establish a system of warehouses for commodities to be paid as wages. These contrivances would provisionally leave property in

Socialist Views.

land and capital as at present, except that for the future the laboring classes would share in the ceasing productivity; but the ultimate goal is the replacement of this form of property by a property of income alone, which would inaugurate a new and a higher State order than any that has gone before. But Rodbertus' work-day does not mean with him what it means with most socialists—a legally deter-

mined number of hours' work daily. He expressly says in one place that the expectation that such a normal work-day will protect the laborers from the greed of their employers, and secure them fair wages, is entirely without foundation. Nor does he regard the legal limitation of the period of labor in the case of adult males as tenable on practical grounds, or defensible when regarded from the standpoint of personal right, though he makes an exception with females and children. "As much as I am for the subordination of the individual to the State," he says, "I still maintain that the State has no right to say to a free man, 'You shall work no more than so and so many hours.'" The proper thing is to increase wages, and then, if the workman finds that he can earn in four hours enough to keep him for the day, there will be little fear of his working twelve. Even if the State were to restrict the hours of labor to eight, and to decree that wages should not be reduced, the material position of the working classes would not be improved. "Legislation which *only* restricts the hours of labor merely lops the branches of a poison tree. Legislation which at once fixes a definite amount of labor, or rather a definite performance (*Leistungsquantum*), lays the ax at its roots, plants in its place a healthy, fruitful tree, which it can then allow to shoot and blossom as freely as it will." "The way is long," he remarks in one of his letters, but for that reason it is desirable that the journey shall be begun without delay. Justice and prudence alike urge the necessity for movement, since the social question is fast taking this form: "Are the proprietors of the soil to be driven out, as in a migration of the nations, by those who are without property?" But the cost! "Certainly, the solution of the social problem will cost more than the printer's ink of a police order, simply because it *is* the social problem." He is confident that this problem will never be settled "in the street by means of strikes, paving-stones, or petroleum;" that social ills will not be "relieved, much less healed, by camomile tea." Permanent social peace, a strong executive power, enjoying the confidence and attachment of the working classes, and extensive preparations made in quiet and order, are all necessary preliminaries to the final settlement of a difficulty which becomes more dangerous the longer it is ignored.

Rodbertus' most important works, besides the above named, are *Soziale Briefe an v. Kirchmann* (1850-51); *Zür Erklärung und Abhülfe der heutigen Kreditnoth des Grundbestandes* (1868-69); *Der normale Arbeitstag* (1871).

The best English account of Rodbertus is to be found in W. H. Dawson's *Socialism and Ferdinand Lassalle*, from which our account is abridged.

ROGERS, JAMES EDWIN THOROLD, was born in Hampshire, England, in 1823. He matriculated at Magdalen Hall, Oxford, in 1842, and was graduated in 1846. He took holy orders, but later renounced them. In 1862 he was elected professor of Political Economy at Oxford, but failed of reelection in 1868, owing to his radical views. From 1880 to 1886 he sat in Parliament, and was reinstated professor at Oxford in 1888, where he died in 1890. Commencing as an economist of the orthodox economic school, he devoted himself to economic historical research, and his investigations soon convinced him that orthodoxy in this case was very radically wrong; and this conviction grew still more upon him, and was stated with still greater force, as years went on.

With the conclusions that he drew from his labors in social and industrial history, later economists have felt themselves often compelled to disagree, but his learning and capacity for research none can question.

Professor Rogers' main results are found in

his 1-vol. *Six Centuries of Work and Wages* (1885), and more comprehensively and minutely in his 6-vol. *History of Agriculture and Prices* (1836-88). Twenty years of patient investigation he put into his *History of Agriculture and Prices*. He has collected thousands and thousands of records of prices actually paid for different commodities, or for various kinds of labor; has put together the records of the different kinds belonging to the same year; has averaged these, has then averaged these averages for decades, and finally these decade averages for period averages; and has thus obtained results it is impossible to question, because based on statements written with no thought of the use to which they would be put.

Professor Rogers found these records in old exchequer bills, the college records, the manor rolls, the farm accounts preserved, as it were by accident, in the state, university, and municipal archives of English libraries. It was almost by accident that Professor Rogers discovered them and saw their unique value.

His other works were *The Economic Interpretation of History* (1888) and *The Industrial and Commercial History of England* (1892), edited by his son.

ROMAN CATHOLIC CHURCH AND SOCIAL REFORM.

—As the best statement of the attitude of the Roman Catholic Church to social reform, we print in full the Encyclical Letter of Pope Leo XIII., dated May 15, 1891, on the condition of the working classes, and a portion of the Encyclical of January 10, 1890, on the chief duties of Christians as citizens. For the attitude of the Roman Catholic Church in education, see article, RELIGION IN THE PUBLIC SCHOOLS. For the contributions of the Roman Catholic Church to social reform in the past, see articles, CHURCH AND SOCIAL REFORM; CHRISTIANITY AND SOCIAL REFORM; CHRISTIAN SOCIALISM; MIDDLE AGES; USURY; INSTITUTIONAL CHURCHES, etc. The text of the following translations is taken from the volume, *The Pope and the People*, edited by the Rev. W. H. Eyre, S. J., and approved by the Archbishop of Westminster, London:

"THE CONDITION OF THE WORKING CLASSES.

"That the spirit of revolutionary change, which has long been disturbing the nations of the world, should have passed beyond the sphere of politics and made its influence felt in the cognate sphere of practical economics is not surprising. The elements of the conflict now raging are unmistakable, in the vast expansion of industrial pursuits and the marvelous discoveries of science; in the changed relations between masters and workmen; in the enormous fortunes of some few individuals and the utter poverty of the masses; in the increased self-reliance and closer mutual combination of the working classes; as also, finally in the prevailing moral degeneracy. The momentous gravity of the state of things now obtaining fills every mind with painful apprehension; wise men are discussing it; practical men are proposing schemes; popular meetings, legislatures, and rulers of nations are all busied with it—and actually there is no question which has taken a deeper hold on the public mind.

"Therefore, Venerable Brethren, as on former occasions when it seemed opportune to refute false teaching, we have addressed you in the interests of the Church and of the common weal, and have issued letters bearing on *Political Power, Human Liberty, The Christian Constitution of the State*, and like mat-

ters, so have we thought it expedient now to speak on *The Condition of the Working Classes*. It is a subject on which we have already touched more than once, incidentally. But in the present letter the responsibility of the Apostolic office urges us to treat the question of set purpose and in detail, in order that no misapprehension may exist as to the principles which truth and justice dictate for its settlement. The discussion is not easy, nor is it void of danger. It is no easy matter to define the relative rights and mutual duties of the rich and of the poor, of capital and of labor. And the danger lies in this, that crafty agitators are intent on making use of these differences of opinion to pervert men's judgments and to stir up the people to revolt.

"But all agree, and there can be no question whatever, that some remedy must be found, and found quickly, for the misery and wretchedness pressing so heavily and unjustly at this moment on the vast majority of the working classes.

"For the ancient working men's Guilds were abolished in the last century, and no other organization took their place. Public institutions and the very laws have set aside the ancient religion. Hence, by degrees it has come to pass that working men have been surrendered, all isolated and helpless, to the hard-heartedness of employers and the greed of unchecked competition. The mischief has been increased by rapacious usury, which, although more than once condemned by the Church, is nevertheless, under a different guise, but with the like injustice, still practised by covetous and grasping men. To this must be added the custom of working by contract, and the concentration of so many branches of trade in the hands of a few individuals; so that a small number of very rich men have been able to lay upon the teeming masses of the laboring poor a yoke little better than that of slavery itself.

"To remedy these wrongs the socialists, working on the poor man's envy of the rich, are striving to do away with private property, and contend that individual possessions should become the common property of all, to be administered by the State or by municipal bodies. They hold that by thus transferring property from private individuals to the community, the present mischievous state of things will be set to rights, inasmuch as each citizen will then get his fair share of whatever there is to enjoy. But their contentions are so clearly powerless to end the controversy that, were they carried into effect, the working man himself would be among the first to suffer. They are moreover emphatically unjust, because they would rob the lawful possessor, bring State action into a sphere not within its competence, and create utter confusion in the community.

Socialism.

"It is surely undeniable that, when a man engages in remunerative labor, the impelling reason and motive of his work is to obtain property, and thereafter to hold it as his very own. If one man hires out to another his strength or skill, he does so for the purpose of receiving in return what is necessary for sustenance and education; he therefore expressly intends to acquire a right full and real, not only to the remuneration, but also to the disposal of such remuneration, just as he pleases. Thus, if he lives sparingly, saves money, and, for greater security, invests his savings in land, the land, in such case, is only his wages under another form; and, consequently, a working man's little estate thus purchased should be as completely at his full disposal as are the wages he receives for his labor. But it is precisely in such power of disposal that ownership obtains, whether the property consist of land or chattels. Socialists, therefore, by endeavoring to transfer the possessions of individuals to the community at large, strike at the interests of every wage-earner, since they would deprive him of the liberty of disposing of his wages, and thereby of all hope and possibility of increasing his stock and of bettering his condition in life.

Private Property.

"What is of far greater moment, however, is the fact that the remedy they propose is manifestly against justice. For every man has by nature the right to possess property as his own. This is one of the chief points of distinction between man and the animal creation, for the brute has no power of self-direction, but is governed by two main instincts, which keep his powers on the alert, impel him to develop them in a fitting manner, and stimulate and determine him to action without any power of choice. One of these

instincts is self-preservation, the other the propagation of the species. Both can attain their purpose by means of things which lie within range; beyond their verge the brute creation cannot go, for they are moved to action by their senses only, and in the special direction which these suggest. But with man it is wholly different. He possesses, on the one hand, the full perfection of the animal being, and hence enjoys, at least as much as the rest of the animal kind, the fruition of things material. But animal nature, however perfect, is far from representing the human being in its completeness, and is in truth but humanity's humble handmaid, made to serve and to obey. It is the mind, or reason, which is the predominant element in us who are human creatures; it is this which renders a human being human, and distinguishes him essentially and generically from the brute. And on this very account—that man alone among the animal creation is endowed with reason—it must be within his right to possess things not merely for temporary and momentary use, as other living things do, but to have and to hold them in stable and permanent possession; he must have not only things that perish in the USE but those also which, though they have been reduced into use, continue for further use in after time.

"This becomes still more clearly evident if man's nature be considered a little more deeply. For man, fathoming by his faculty of reason matters without number, and linking the future with the present, becoming, furthermore, by taking enlightened forethought, master of his own acts, guides his ways under the eternal law and the power of God, whose Providence governs all things. Wherefore it is in his power to exercise his choice not only as to matters that regard his present welfare, but also about those which he deems may be for his advantage in time yet to come. Hence man not only can possess the fruits of the earth, but also the very soil, inasmuch as from the produce of the earth he has to lay by provision for the future. Man's needs do not die out, but recur; although satisfied to-day, they demand fresh supplies for to-morrow. Nature accordingly owes to man a storehouse that shall never fail, affording the daily supply for his daily wants. And this he finds solely in the inexhaustible fertility of the earth.

"Neither do we, at this stage, need to bring into action the interference of the State. Man precedes the State, and possesses, prior to the formation of any State, the right of providing for the sustenance of his body. Now to affirm that God has given the earth for the use and enjoyment of the whole human race is not to deny that private property is lawful. For God has granted the earth to mankind in general, not in the sense that all without distinction can deal with it as they like, but rather that no part of it has been assigned to any one in particular, and that the limits of private possession have been left to be fixed by man's own industry, and by the laws of individual races. Moreover, the earth, even though apportioned among private owners, ceases not thereby to minister to the needs of all, inasmuch as there is no one who does not sustain life from what the land produces. Those who do not possess the soil contribute their labor; hence it may truly be said that all human subsistence is derived either from labor on one's own land, or from some toilsome calling, which is paid for either in the produce of the land itself, or in that which is exchanged for what the land brings forth.

"Here, again, we have further proof that private ownership is in accordance with the law of nature. Truly, that which is required for the preservation of life, and for life's well being, is produced in great abundance from the soil, but not until man has brought it into cultivation and expended upon it his solicitude and skill. Now, when man thus turns the activity of his mind and the strength of his body toward procuring the fruits of nature, by such act he makes his own that portion of nature's field which he cultivates—that portion on which he leaves, as it were, the impress of his individuality; and it cannot be just that he should possess that portion as his very own, and have a right to hold it without anyone being justified in violating that right.

"So strong and convincing are these arguments that it seems amazing that some should now be setting up anew certain obsolete opinions in opposition to what is here laid down. They assert that it is right for private persons to have the use of the soil and its various fruits, but that it is unjust for any one to possess outright either the land on which he has built, or the estate which he has brought under cultivation. But those who deny these rights do not perceive that they

are defrauding man of what his own labor has produced. For the soil which is tilled and cultivated with toil and skill utterly changes its condition; it was wild before, now it is fruitful; was barren, but now brings forth in abundance. That which has thus altered and improved the land becomes so truly part of itself as to be in great measure indistinguishable and inseparable from it. Is it just that the fruit of a man's own sweat and labor should be possessed and enjoyed by any one else? As effects follow their cause, so is it just and right that the results of labor should belong to those who have bestowed their labor.

"With reason, then, the common opinion of mankind, little affected by the few dissentients who have contended for the opposite view, has found in the careful study of nature, and in the laws of nature, the foundations of the division of property, and the practise of all ages has consecrated the principle of private ownership, as being preeminently in conformity with human nature, and as conducing in the most unmistakable manner to the peace and tranquillity of human existence. The same principle is confirmed and enforced by the civil laws—laws which, so long as they are just, derive from the law of nature their binding force. The authority of the Divine Law adds its sanction, forbidding us in severest terms even to covet that which is another's: *Thou shalt not covet thy neighbor's wife; nor his house, nor his field, nor his manservant, nor his maidservant, nor his ox, nor his ass, nor anything which is his.**

"The rights here spoken of, belonging to each individual man, are seen in much stronger light when considered in relation to man's social and domestic obligations. In choosing a state of life, it is indisputable that all are at full liberty to follow the counsel of Jesus Christ as to observing virginity, or to bind themselves by the marriage tie. No human law can abolish the natural and original right of marriage, nor in any way limit the chief and principal purpose of marriage, ordained by God's authority from the beginning. *Increase and multiply,†* Hence we have the family: the 'society' of a man's house—a society limited indeed in numbers, but no less a true 'society,' anterior to every kind of State or nation, invested with rights and duties of its own, totally independent of the civil community.

"That right of property, therefore, which has been proved to belong naturally to individual persons, must likewise belong to a man in his capacity of head of a family; nay, such a person must possess this right so much the more clearly in proportion as his position multiplies his duties. For it is a most sacred law of nature that a father should provide food and all necessities for those whom he has begotten; and, similarly, nature dictates that a man's children, who carry on, so to speak, and continue his own personality, should be by him provided with all that is needful to enable them to keep themselves honorably from want and misery amid the uncertainties of this mortal life. Now, in no other way can a father effect this except by the ownership of lucrative property, which he can transmit to his children by inheritance. A family, no less than a State, is, as we have said, a true society, governed by a power within its sphere, that is to say, by the father. Provided, therefore, the limits which are prescribed by the very purposes for which it exists be not transgressed, the family has at least equal rights with the State in the choice and pursuit of the things needful to its preservation and its just liberty.

"We say, at least equal rights; for inasmuch as the domestic household is antecedent, as well in idea as in fact, to the gathering of men into a community, the family must necessarily have rights and duties which are prior to those of the community, and founded more immediately in nature. If the citizens of a State—in other words the families—on entering into association and fellowship were to experience at the hands of the State hindrance instead of help, and were to find their rights attacked instead of being upheld, such association should be held in detestation, rather than be an object of desire.

"The contention, then, that the civil government should at its option intrude into and exercise intimate control over the family and the household, is a great and pernicious error. True, if a family finds itself in exceeding distress, utterly deprived of the counsel of friends, and without any prospect of extricating itself, it is right that extreme necessity be met by public

* Deuteronomy v. 21.

† Genesis i. 28.

The Family.

aid, since each family is a part of the commonwealth. In like manner, if within the precincts of the household there occur grave disturbance of mutual rights, public authority should intervene to force each party to yield to the other its proper due, for this is not to deprive citizens of their rights, but justly and properly to safeguard and strengthen them. But the rulers of the State must go no further; here nature bids them stop. Paternal authority can be neither abolished nor absorbed by the State; for it has the same source as human life itself. 'The child belongs to the father,' and is, as it were, the continuation of the father's personality; and, speaking strictly, the child takes its place in civil society, not of its own right, but in its quality as member of the family in which it is born. And for the reason that 'the child belongs to the father,' it is, as St. Thomas of Aquin says, 'before it attains the use of free will, under power and charge of its parents.*' The socialists, therefore, in setting aside the parent and setting up a State supervision, act *against natural justice*, and break into pieces the stability of all family life.

"And not only is such interference unjust, but it is quite certain to harass and worry all classes of citizens, and subject them to odious and intolerable bondage. It would throw open the door to envy, to mutual invective, and to discord; the sources of wealth themselves would run dry, for no one would have any interest in exerting his talents or his industry; and that ideal equality about which they entertain pleasant dreams would be in reality the leveling down of all to a like condition of misery and degradation.

"Hence it is clear that the main tenet of socialism, community of goods, must be utterly rejected, since it only injures those whom it would seem meant to benefit, is directly contrary to the natural rights of mankind, and would introduce confusion and disorder into the commonweal. The first and most fundamental principle, therefore, if one would undertake to alleviate the condition of the masses, must be the inviolability of private property. This being established, we proceed to show where the remedy sought for must be found.

"We approach the subject with confidence, and in the exercise of the rights which manifestly appertain to us, for no practical solution of this question will be found, apart from the intervention of religion and of the Church. It is we who are the chief guardian of religion, and the chief dispenser of what pertains to the

Religion.

Church, and we must not by silence neglect the duty incumbent on us. Doubtless this most serious question demands the attention and the efforts of others besides ourselves—to wit, of the rulers of States, of employers of labor, of the wealthy, aye, of the working classes themselves, for whom we are pleading. But we affirm without hesitation that all the striving of men will be vain if they leave out the Church. It is the Church that insists, on the authority of the Gospel, upon those teachings whereby the conflict can be brought to an end, or rendered, at least, far less bitter; the Church uses her efforts, not only to enlighten the mind, but to direct by her precepts the life and conduct of each and all; the Church improves and betters the condition of the working man by means of numerous useful organizations; does her best to enlist the services of all ranks in discussing and endeavoring to meet, in the most practical way, the claims of the working classes; and acts from the positive view that for these purposes recourse should be had, in due measure and degree, to the intervention of the law and of State authority. Let it, then, be taken as granted, in the first place, that the condition of things human must be endured, for it is impossible to reduce civil society to one dead level. Socialists may in that intent do their utmost, but all striving against nature is in vain. There naturally exist among mankind manifold differences of the most important kind; people differ in capacity, skill, health, strength; and unequal fortune is a necessary result of unequal condition. Such inequality is far from being disadvantageous, either to individuals, or to the community. Social and public life can only be maintained by means of various kinds of capacity for business, and the playing of many parts; and each man, as a rule, chooses the part which suits his own peculiar domestic condition. As regards bodily labor, even had man never fallen from the *state of innocence*, he would not have remained wholly unoccupied; but that which would then have been his free choice and his

delight became afterward compulsory, and the painful expiation for his disobedience. *Cursed be the earth in thy work; in thy labor thou shalt eat of it all the days of thy life.** In like manner, the other pains and hardships of life will have no end or cessation on earth; for the consequences of sin are bitter and hard to bear, and they must accompany man so long as life lasts. To suffer and to endure, therefore, is the lot of humanity; let them strive as they may, no strength and no artifice will ever succeed in banishing from human life the ills and troubles which beset it. If any there are who pretend differently—who hold out to a hard-pressed people the boon of freedom from pain and trouble, and undisturbed repose, and constant enjoyment—they delude the people and impose upon them, and their lying promises will only one day bring forth evils worse than the present. Nothing is more useful than to look upon the world as it really is—and at the same time to seek elsewhere, as we have said, for the solace to its troubles.

"The great mistake made in regard to the matter now under consideration is to take up with the notion that class is naturally hostile to class, and that the wealthy and the working men are intended by nature to live in mutual conflict. So irrational and so false is this view that the direct contrary is the truth. Just as the symmetry of the human frame is the resultant of the disposition of the bodily members, so in a State is it ordained by nature that these two classes should dwell in harmony and agreement, and should, as it were, groove into one another, so as to maintain the balance of the body politic. Each needs the other; capital cannot do without labor, nor labor without capital. Mutual agreement results in pleasantness of life and the beauty of good order; while perpetual conflict necessarily produces confusion and savage barbarity. Now, in preventing such strife as this, and in uprooting it, the efficacy of Christian institutions is marvelous and manifold. First of all, there is no intermediary more powerful than religion (whereof the Church is the interpreter and guardian) in drawing the rich and the poor bread-winners together, by reminding each class of its duties to the other, and, especially, of the obligations of justice. Thus religion teaches the laboring man and the artisan to carry out honestly and fairly all equitable agreements freely entered into; never to injure the property, nor to outrage the person, of an employer; never to resort to violence in defending their own cause, nor to engage in riot or disorder; and to have nothing to do with men of evil principles, who work upon the people with artful promises, and excite foolish hopes which usually end in useless regrets, followed by insolvency. Religion teaches the wealthy owner and the employer that their work people are not to be accounted their bondsmen; that in every man they must respect his dignity and worth as a man and as a Christian; that labor is not a thing to be ashamed of, if we lend ear to right reason and to Christian philosophy, but is an honorable calling, enabling a man to sustain his life in a way upright and creditable; and that it is shameful and inhuman to treat men like chattels to make money by, or to look upon them merely as so much muscle or physical power. Again, therefore, the Church teaches that, as religion and things spiritual and mental are among the working man's main concerns, the employer is bound to see that the worker has time for his religious duties; that he be not exposed to corrupting influences and dangerous occasions; and that he be not led away to neglect his home and family, or to squander his earnings. Furthermore, the employer must never tax his work people beyond their strength, or employ them in work unsuited to their sex or age. His great and principal duty is to give every one a fair wage. Doubtless, before deciding whether wages are adequate, many things have to be considered; but wealthy owners and all masters of labor should be mindful of this—that to exercise pressure upon the indigent and the destitute for the sake of gain, and to gather one's profit out of the need of another, is condemned by all laws, human and divine. To defraud any one of wages that are his due is a crime which cries to the avenging anger of Heaven. *Behold, the hire of the laborers . . . which by fraud hath been kept back by you, crieth aloud; and the cry of them hath entered into the ears of the Lord of Sabaoth.*† Lastly, the rich must religiously refrain from cutting down the workmen's earnings, whether by force, by fraud,

**Class
Should Help
Class.**

* St. Thomas, *Summa Theologica*, 2a 2æ Q. x. Art. 12.

* Genesis iii. 17.

† St. James v. 4.

or by usurious dealing; and with all the greater reason because the laboring man is, as a rule, weak and unprotected, and because his slender means should, in proportion to their scantiness, be accounted sacred.

"Were these precepts carefully obeyed and followed out, would they not be sufficient of themselves to keep under all strife, and all its causes?"

"But the Church, with Jesus Christ as her Master and Guide, aims higher still. She lays down precepts yet more perfect, and tries to bind class to class in friendliness and good feeling. The things of earth cannot be understood or valued aright without taking into consideration the life to come, the life that will know no death. Exclude the idea of futurity, and forthwith the very notion of what is good and right would perish; nay, the whole scheme of the universe would become a dark and unfathomable mystery. The great truth which we learn from Nature herself is also the grand Christian dogma on which religion rests as on its foundation—that when we have given up this present life, then shall we really begin to live. God has not created us for the perishable and transitory things of earth, but for things heavenly and everlasting; he has given us this world as a place of exile, and not as our abiding-place. As for riches and the other things which men call good and desirable, whether we have them in abundance, or lack them altogether—so far as eternal happiness is concerned—it matters little; the only important thing is to use them aright. Jesus Christ, when he redeemed us with plentiful redemption,* took not away the pains and sorrows which in such large proportion are woven together in the web of our mutual life. He transformed them into motives of virtue and occasions of merit; and no man can hope for eternal reward unless he follow in the blood-stained footprints of his Savior. *If we suffer with Him, we shall also reign with Him.*† Christ's labors and sufferings, accepted of his own free will, have marvelously sweetened all suffering and all labor. And not only by his example, but by his grace, and by the hope set forth of everlasting recompense, has he made pain and grief more easy to endure; for that which is at present momentary and light of our tribulation, worketh for us above measure exceedingly an eternal weight of glory.‡

"Therefore, those whom fortune favors are warned that freedom from sorrow and abundance of earthly riches are no warrant for the bliss that shall never end, but rather are obstacles;|| that the rich should tremble at the threatenings of Jesus Christ—threatenings so unwonted in the mouth of Our Lord§—and that a most strict account must be given to the Supreme Judge for all we possess. The chief and most excellent rule for the right use of money is one which the heathen philosophers hinted at, but which the Church has traced out clearly, and has not only made known to men's minds, but has impressed upon their lives. It rests on the principle that it is one thing to have a right to the possession of money, and another to have a right to use money as one will. Private ownership, as we have seen, is the natural right of man; and to exercise that right, especially as members of society, is not only lawful, but absolutely necessary. 'It is lawful,' said St. Thomas of Aquin, "for a man to hold private property; and it is also necessary for the carrying on of human existence."¶ But if the question be asked, How must one's possessions be used? the Church replies without hesitation in the words of the same holy doctor: 'Man should not consider his outward possessions as his own, but as common to all, so as to share them without hesitation when others are in need. Whence the Apostle saith, *Command the rich of this world. . . to offer with no stint, to apportion largely.*'** True, no one is commanded to distribute to others that which is required for his own needs and those of his household; nor even to give away what is reasonably required to keep up becomingly his condition in life: 'for no one ought to live other than becomingly.'†† But when what necessity denies has been supplied, and one's standing fairly taken thought for, it becomes a duty to give to the indigent out of what remains over. *Of that which remaineth, give alms.*‡‡ It is a duty, not of justice (save in extreme cases), but of Christian charity—a duty not enforced by human law. But the laws and judgments of men must yield place to the laws and judgments of Christ, the true God, who in many ways urges on his followers the practise of alms-

giving—*It is more blessed to give than to receive;** and who will count a kindness done or refused to the poor as done or refused to himself—*As long as you did it to one of my least brethren, you did it to me.*† To sum up then what has been said: Whoever has received from the Divine bounty a large share of temporal blessings, whether they be external and corporeal, or gifts of the mind, has received them for the purpose of using them for the perfecting of his own nature, and, at the same time, that he may employ them, as the steward of God's Providence, for the benefit of others. 'He that hath a talent,' says St. Gregory the Great, 'let him see that he hide it not; he that hath abundance, let him quicken himself to mercy and generosity; he that hath art and skill, let him do his best to share the use and the utility thereof with his neighbor.‡'

"As for those who possess not the gifts of fortune, they are taught by the Church that in God's sight poverty is no disgrace, and that there is nothing to be ashamed of in one's seeking one's bread by labor. This is enforced by what we see in Christ who himself, whereas he was rich, for our sakes became poor.¶ and who, being the Son of God, and God himself, chose to seem and be considered the son of a carpenter—nay, did not disdain to spend a great part of his life as a carpenter himself. *Is not this the carpenter, the son of Mary?*§ From contemplation of this Divine exemplar, it is more easy to understand that the true worth and nobility of man lies in his moral qualities, that is, in virtue; that virtue is moreover the common inheritance of men, equally within the reach of high and low, rich and poor; and that virtue, and virtue alone, wherever found, will be followed by the rewards of everlasting happiness. Nay, God himself seems to incline rather to those who suffer misfortune; for Jesus Christ calls the poor 'blessed';¶ he lovingly invites those in labor and grief to come to him for solace; ** and he displays the tenderest charity toward the lowly and the oppressed. These reflections cannot fail to keep down the pride of those who are well-to-do, and to embolden the spirit of the afflicted; to incline the former to generosity, and the latter to meek resignation. Thus the separation which pride would set up tends to disappear, nor will it be difficult to make rich and poor join hands in friendly concord.

"But, if Christian precepts prevail, the respective classes will not only be united in the bonds of friendship, but also in those of brotherly love. For they will understand and feel that all men are children of the same common Father, who is God; that all have alike the same last end, which is God himself, who alone can make either men or angels absolutely and perfectly happy; that each and all are redeemed and made sons of God, by Jesus Christ, the first-born among many brethren; that the blessings of nature and the gifts of grace belong to the whole human race in common, and that from none except the unworthy is withheld the inheritance of the Kingdom of Heaven. *If sons, heirs also; heirs indeed of God, and co-heirs of Christ.*††

"Such is the scheme of duties and of rights which is shown forth to the world by the Gospel. Would it not seem that, were society penetrated with ideas like these, strife must quickly cease?"

"But the Church, not content with pointing out the remedy, also applies it. For the Church does her utmost to teach and to train men, and to educate them; and by the intermediary of her bishops and clergy diffuses her salutary teachings far and wide. She strives to influence the mind and the heart so that all men may willingly yield themselves to be formed and guided by the commandments of God. It is precisely in this fundamental and momentous matter, on which everything depends, that the Church possesses a power peculiarly her own. The agencies which she employs are given to her by Jesus Christ himself, for the very purpose of reaching the hearts of men, and derive their efficiency from God. They alone can reach the innermost heart and conscience,

The Poor.

The Church Serves Society.

and bring men to act from a motive of duty, to resist their passions and appetites, to love God and their fellow-men with a love that is singular and supreme, and to break down courageously every barrier which impedes the way of a life of virtue.

"On this subject we need but recall for one moment the examples recorded in history. Of these facts there cannot be any shadow of doubt; for instance, that civil society was renovated in every part by the teachings of Christianity; that in the strength of that renewal the human race was lifted up to better things—nay, that it was brought back from death to life, and to so excellent a life that nothing more perfect had been known before, or will come to be known in the ages that have yet to be. Of this beneficent transformation, Jesus Christ was at once the first cause and the final end; as from him all came, so to him was all to be brought back. For when the human race, by the light of the Gospel message, came to know the grand mystery of the Incarnation of the Word and the redemption of man, at once the life of Jesus Christ, God and Man, pervaded every race and nation, and interpenetrated them with his faith, his precepts, and his laws. And if society is to be healed now, in no other way can it be healed save by a return to Christian life and Christian institutions. When a society is perishing, the wholesome advice to give to those who would restore it is to recall it to the principles from which it sprang; for the purpose and perfection of an association is to aim at and to attain that for which it was formed; and its efforts should be put in motion and inspired by the end and object which originally gave it being. Hence to fall away from its primal constitution implies disease; to go back to it, recovery. And this may be asserted with utmost truth, both of the State in general, and of that body of its citizens—by far the great majority—who sustain life by their labor.

"Neither must it be supposed that the solicitude of the Church is so preoccupied with the spiritual concerns of her children as to neglect their temporal and earthly interests. Her desire is that the poor, for example, should rise above poverty and wretchedness, and better their condition in life; and for this she makes a strong endeavor. By the very fact that she calls men to virtue and forms them to its practise, she promotes this in no slight degree. Christian morality, when adequately and completely practised, leads of itself to temporal prosperity, for it merits the blessing of that God who is the source of all blessings; it powerfully restrains the greed of possession and the thirst for pleasure—two plagues, which too often make a man who is void of self-restraint miserable in the midst of abundance;* it makes men supply for the lack of means through economy, teaching them to be content with frugal living, and further, keeping them out of the reach of those vices which devour not small incomes merely, but large fortunes, and dissipate many a goodly inheritance.

"The Church, moreover, intervenes directly in behalf of the poor, by setting on foot and maintaining many associations which she knows to be efficient for the relief of poverty. Herein again she has always succeeded so well as to have even extorted the praise of her enemies. Such was the ardor of brotherly love among the earliest Christians that numbers of those who were in better circumstances despoiled themselves of their possessions in order to relieve their brethren; whence *neither was there any one needy among them.*† To the order of deacons, instituted in that very intent, was committed by the Apostles the charge of the daily doles; and the Apostle Paul, though burdened with the solicitude of all the churches, hesitated not to undertake laborious journeys in order to carry the alms of the faithful to the poorer Christians. Tertullian calls these contributions, given voluntarily by Christians in their assemblies, deposits of piety; because to cite his own words, they were employed 'in feeding the needy, in burying them, in the support of youths and maidens destitute of means and deprived of their parents, in the care of the aged, and the relief of the shipwrecked.'‡

"Thus by degrees came into existence the patrimony which the Church has guarded with religious care as the inheritance of the poor. Nay, to spare them the shame of begging, the common Mother of rich and poor has exerted herself to gather together funds for the support of the needy. The Church has aroused everywhere the heroism of charity, and has

established congregations of religious and many other useful institutions for help and mercy, so that hardly any kind of suffering could exist which was not afforded relief. At the present day many there are who, like the heathen of old, seek to blame and condemn the Church for such eminent charity. They would substitute in its stead a system of relief organized by the State. But no human expedients will ever make up for the devotedness and self-sacrifice of Christian charity. Charity, as a virtue, pertains to the Church; for virtue it is not, unless it be drawn from the Sacred Heart of Jesus Christ; and whosoever turns his back on the Church cannot be near to Christ.

"It cannot, however, be doubted that to attain the purpose we are treating of, not only the Church, but all human agencies must concur. All who are concerned in the matter should be of one mind and according to their ability act together. It is with this, as with the Providence that governs the world; the results of causes do not usually take place save where all the causes cooperate.

"It is sufficient, therefore, to inquire what part the State should play in the work of remedy and relief.

"By the State we here understand not the particular form of government prevailing in this or that nation, but

The State.

the State as rightly apprehended; that is to say, any government conformable in its institutions to right reason and natural law, and to those dictates of the Divine wisdom which we have expounded in the Encyclical on *The Christian Constitution of the State*. The foremost duty, therefore, of the rulers of the State should be to make sure that the laws and institutions, the general character and administration of the commonwealth, shall be such as of themselves to realize public well-being and private prosperity. This is the proper scope of wise statesmanship and is the work of the heads of the State. Now, a State chiefly prospers and thrives through moral rule, well-regulated family life, respect for religion and justice, the moderation and equal allocation of public taxes, the progress of the arts and of trade, the abundant yield of the land—through everything, in fact, which makes the citizens better and happier. Hereby, then, it lies in the power of a ruler to benefit every class in the State, and among the rest to promote to the utmost the interests of the poor; and this in virtue of his office, and without being open to any suspicion of undue interference—since it is the province of the State to consult the common good. And the more that is done for the benefit of the working classes by the general laws of the country, the less need will there be to seek for special means to relieve them.

"There is another and deeper consideration which must not be lost sight of. As regards the State, the interests of all, whether high or low, are equal. The poor are members of the national community equally with the rich; they are real component living members which constitute, through the family, the living body; and it need hardly be said that they are in every State very largely in the majority. It would be irrational to neglect one portion of the citizens and favor another; and therefore the public administration must duly and solicitously provide for the welfare and the comfort of the working classes; otherwise that law of justice will be violated which ordains that each man shall have his due. To cite the wise words of St. Thomas of Aquin: 'As the part and the whole are in a certain sense identical, the part may in some sense claim what belongs to the whole.'* Among the many and grave duties of rulers who would do their best for the people, the first and chief is to act with strict justice—with that justice which is called by the schoolmen *distributive*—toward each and every class alike.

"But altho all citizens, without exception, can and ought to contribute to that common good in which individuals share so advantageously to themselves, yet it should not be supposed that all can contribute in the like way and to the same extent. No matter what changes may occur in forms of government, there will ever be differences and inequalities of condition in the State. Society cannot exist or be conceived of without them. Some there must be who devote themselves to the work of the commonwealth, who make the laws or administer justice, or whose advice and authority govern the nation in times of peace, and defend it in war. Such men clearly occupy the foremost place in the State, and should be held in highest estimation, for their work concerns most nearly and

* *The desire of money is the root of all evils.*—1 Timothy vi. 10.

† Acts iv. 34.

‡ *Apologia Secunda*, xxxix.

* 2a 2æ Q. lxi. Art. 1 ad 2.

effectively the general interests of the community. Those who labor at a trade or calling do not promote the general welfare in such measure as this; but they benefit the nation, if less directly, in a most important manner. Still we have insisted that, since the end of society is to make men better, the chief good that society can possess is virtue. Nevertheless, in all well-constituted States it is in no wise a matter of small moment to provide those bodily and external commodities *the use of which is necessary to virtuous action.** And in order to provide such material well-being, the labor of the poor—the exercise of their skill, and the employment of their strength, in the culture of the land and in the work-shops of trade—is of great account and quite indispensable. Indeed, their cooperation is in this respect so important that it may be truly said that it is only by the labor of working men that States grow rich. Justice, therefore, demands that the interests of the poorer classes should be carefully watched over by the administration, so that they who contribute so largely to the advantage of the community may themselves share in the benefits which they create—that being housed, clothed, and enabled to sustain life, they may find their existence less hard and more endurable. It follows that whatever shall appear to prove conducive to the well-being of those who work should obtain favorable consideration. Let it not be feared that solicitude of this kind will be harmful to any interest; on the contrary, it will be to the advantage of all; for it cannot but be good for the commonwealth to shield from misery those on whom it so largely depends.

"We have said that the State must not absorb the individual or the family; but should be allowed free and untrammelled action so far as is consistent with the common good and the interests of others. Rulers should, nevertheless, anxiously safeguard the community and all its members: the community, because the conservation thereof is so emphatically

State Interference.

the business of the supreme power that the safety of the commonwealth is not only the first law, but it is a government's whole reason of existence; and the members, because both philosophy and the Gospel concur in laying down that the object of the government of the State should be not the advantage of the ruler, but the benefit of those over whom he is placed. The gift of authority derives from God, and is, as it were, a participation in the highest of all sovereignties; and should be exercised as the power of God is exercised—with a fatherly solicitude which not only guides the whole, but reaches also to details.

"Whenever the general interest or any particular class suffers, or is threatened with mischief which can in no other way be met or prevented, the public authority must step in to deal with it. Now, it interests the public, as well as the individual, that peace and good order should be maintained; that family life should be carried on in accordance with God's laws and those of nature; that religion should be revered and obeyed; that a high standard of morality should prevail, both in public and private life; that the sanctity of justice should be respected, and that no one should injure another with impunity; that the members of the commonwealth should grow up to man's estate strong and robust, and capable, if need be, of guarding and defending their country. If by a strike, or other combination of workmen, there should be imminent danger of disturbance to the public peace; or if circumstances were such as that among the laboring population the ties of family life were relaxed; if religion were found to suffer through the operatives not having time and opportunity afforded them to practise its duties; if in work-shops and factories there were danger to morals through the mixing of the sexes or from other harmful occasions of evil; or if employers laid burdens upon their workmen which were unjust, or degraded them with conditions repugnant to their dignity as human beings; finally, if health were endangered by excessive labor, or by work unsuited to sex or age—in such cases, there can be no question but that, within certain limits, it would be right to invoke the aid and authority of the law. The limits must be determined by the nature of the occasion which calls for the law's interference—the principle being that the law must not undertake more, nor proceed further, than is required for the remedy of the evil or the removal of the mischief.

"Rights must be religiously respected wherever they exist; and it is the duty of the public authority

to prevent and to punish injury, and to protect every one in the possession of his own. Still, when there is question of defending the rights of individuals, the poor and helpless have a claim to especial consideration. The richer class have many ways of shielding themselves, and stand less in need of help from the State; whereas those who are badly off have no resources of their own to fall back upon, and must chiefly depend upon the assistance of the State. And it is for this reason that wage-earners, who are undoubtedly among the weak and necessitous, should be specially cared for and protected by the Government.

"Here, however, it is expedient to bring under special notice certain matters of moment. It should ever be borne in mind that the chief thing to be realized is the safe-guarding of private property by legal enactment and public policy. Most of all it is essential, amid such a fever of excitement, to keep the multitude within the line of duty; for if all may justly strive to better their condition, neither justice nor the common good allows any individual to seize upon that which belongs to another, or, under the futile and shallow pretext of equality, to lay violent hands on other people's possessions. Most true it is that by far the larger part of the workers prefer to better themselves by honest labor rather than by doing any wrong to others. But there are not a few who are imbued with evil principles and eager for revolutionary change, whose main purpose is to stir up tumult and bring about measures of violence. The authority of the State should intervene to put restraint upon such firebrands, to save the working classes from their seditious arts, and protect lawful owners from spoliation.

"When work-people have recourse to a strike, it is frequently because the hours of labor are too long, or the work too hard, or because they consider their wages insufficient. The grave inconvenience of this not uncommon occurrence should be obviated by public remedial measures; for such paralyzing of labor not only affects the masters and their work-people alike, but is extremely injurious to trade and to the general interests of the public; moreover, on such occasions, violence and disorder are generally not far distant, and thus it frequently happens that the public peace is imperiled. The laws should forestall and prevent such troubles from arising; they should lend their influence and authority to the removal in good time of the causes which lead to conflicts between employers and employed.

"But if owners of property should be made secure, the working man, in like manner, has property and belongings in respect to which he should be protected; and foremost of all, his soul and mind. Life on earth, however good and desirable in itself, is not the final purpose for which man is created; it is only the way and the means to that attainment of truth and that practise of goodness in which the full life of the soul consists. It is the soul which is made after the image and likeness of God; it is in the soul that the sovereignty resides in virtue whereof man is commanded to rule the creatures below him and to use all the earth and the ocean for his profit and advantage. *Fill the earth and subdue it; and rule over the fishes of the sea, and the fowls of the air, and all living creatures which move upon the earth.** In this respect all men are equal; there is no difference between rich and poor, master and servant, ruler and ruled, *for the same Lord is over all.*† No man may with impunity outrage that human dignity which God himself treats *with reverence*, nor stand in the way of that higher life which is the preparation for the eternal life of heaven. Nay, more; no man has in this matter power over himself. To consent to any treatment which is calculated to defeat the end and purpose of his being is beyond his right; he cannot give up his soul to servitude; for it is not man's own rights which are here in question, but the rights of God, the most sacred and inviolable of rights.

"From this follows the obligation of the cessation from work and labor on Sundays and certain holy-days. The rest from labor is not to be understood as mere giving way to idleness; much less must it be an occasion for spending money and for vicious indulgence, as many would have it to be; but it should be rest from labor, hallowed by religion. Rest (combined with religious observances) disposes man to forget for a while the business of his every-day life, to turn his thoughts to things heavenly, and to the worship which he so strictly owes to the Eternal Godhead. It is this, above all, which is the reason and

* St. Thomas of Aquin, *De Regimine Principum*, i. 15.

* Genesis i. 28.
† Romans x. 12.

motive of Sunday rest; a rest sanctioned by God's great law of the Ancient Covenant—*Remember thou keep holy the Sabbath day,** and taught to the world by his own mysterious 'rest' after the creation of man: *He rested on the seventh day from all His work which He had done.†* If we turn now to things external and corporeal, the first concern of all is to save the poor workers from the cruelty of greedy speculators, who use human beings as mere instruments for money-making. It is neither just nor humane so to grind men down with excessive labor as to stupefy their minds and wear out their bodies. Man's powers, like his general nature, are limited, and beyond these limits he cannot go. His strength is developed

The Regulation of Labor.

and increased by use and exercise, but only on condition of due intermission and proper rest. Daily labor, therefore, should be so regulated as not to be protracted over longer hours than strength admits. How many and how long the intervals of rest should be, must depend on the nature of the work, on circumstances of time and place, and on the health and strength of the workman. Those who work in mines and quarries and extract coal, stone, and metals from the bowels of the earth should have shorter hours in proportion as their labor is more severe and trying to health. Then, again, the season of the year should be taken into account, for not unfrequently a kind of labor is easy at one time which at another is intolerable or exceedingly difficult. Finally, work which is quite suitable for a strong man cannot reasonably be required from a woman or a child. And, in regard to children, great care should be taken not to place them in work-shops and factories until their bodies and minds are sufficiently developed. For just as very rough weather destroys the buds of spring, so does too early an experience of life's hard toil blight the young promise of a child's faculties, and render any true education impossible. Women, again, are not suited for home work, and it is that which is best adapted at once to preserve her modesty and to promote the good bringing up of children and the well-being of the family. As a general principle it may be laid down that a workman ought to have leisure and rest proportionate to the wear and tear of his strength; for waste of strength must be repaired by cessation from hard work.

"In all agreements between masters and work-people, there is always the condition expressed or understood that there should be allowed proper rest for soul and body. To agree, in any other sense, would be against what is right and just; for it can never be just or right to require on the one side, or to promise on the other, the giving up of those duties which a man owes to his God and to himself.

"We now approach a subject of great and urgent importance, and one in respect of which, if extremes are to be avoided, right notions are absolutely necessary. Wages, as we are told, are regulated by free consent, and therefore the employer, when he pays what was agreed upon, has done his part and seemingly is not called upon to do anything beyond. The only way, it is

The Living Wage.

said, in which injustice might occur would be if the master refused to pay the whole of the wages, or if the workman should not complete the work undertaken. In such cases the State should intervene, to see that each obtains his due—but not under any other circumstances.

"This mode of reasoning is, to a fair-minded man, by no means convincing, for there are important considerations which it leaves out of account altogether. To labor is to exert oneself for the sake of procuring what is necessary for the purposes of life, and chief of all for self-preservation. *In the sweat of thy brow thou shalt eat thy bread.‡* Hence a man's labor bears two notes or characters. First of all, it is *personal*, inasmuch as the exertion of individual strength belongs to the individual who puts it forth, employing such strength to procure that personal advantage on account of which it was bestowed. Secondly, man's labor is *necessary*; for without the result of labor a man cannot live; and self-preservation is a law of nature, which it is wrong to disobey. Now, were we to consider labor so far as it is *personal* merely, doubtless it would be within the workman's right to accept any rate of wages whatsoever; for in the same way as he is free to work or not, so is he free to accept a small remuneration or even none at all.

But this is a mere abstract supposition; the labor of the working man is not only his personal attribute, but it is *necessary*; and this makes all the difference. The preservation of life is the bounden duty of one and all, and to be wanting therein is a crime. It follows that each one has a right to procure what is required in order to live; and the poor can procure it in no other way than through work and wages.

"Let it be then taken for granted that workman and employer should, as a rule, make free agreements, and in particular should agree freely as to the wages; nevertheless, there underlies a dictate of nature more imperious and more ancient than any bargain between man and man, namely, that the remuneration must be sufficient to support the wage-earner in reasonable and frugal comfort. If through necessity or fear of a worse evil the workman accept harder conditions because an employer or contractor will afford him no better, he is made the victim of force and injustice. In these and similar questions, however,—such as, for example, the hours of labor in different trades, the sanitary precautions to be observed in factories and work-shops, etc.—in order to supersede undue interference on the part of the State, especially as circumstances, times, and localities differ so widely, it is advisable that recourse be had to societies or boards such as we shall mention presently, or to some other mode of safe-guarding the interests of the wage-earners; the State being appealed to, should circumstances require, for its sanction and protection.

"If a workman's wages be sufficient to enable him to maintain himself, his wife, and his children in reasonable comfort, he will not find it difficult, if he be a sensible man, to study economy; and he will not fail, by cutting down expenses, to put by some little savings and thus secure a small income. Nature and reason alike would urge him to this. We have seen that this great labor question cannot be solved save by assuming as a principle that private ownership must be held sacred and inviolable. The law, therefore, should favor ownership, and its policy should be to induce as many as possible of the humbler class to become owners.

"Many excellent results will follow from this; and first of all, property will certainly become more equitably divided. For the result of civil change and revolution has been to divide society into two widely differing castes. On one side there is the party which holds power because it holds wealth; which has in its grasp the whole of labor and trade; which manipulates for its own benefit and its own purposes all the sources of supply, and which is even represented in the councils of the State itself. On the other side there is the needy and powerless multitude, broken-down and suffering, and ever ready for disturbance. If working people can be encouraged to look forward to obtaining a share in the land, the consequence will be that the gulf between vast wealth and sheer poverty will be bridged over, and the respective classes will be brought nearer to one another. A further consequence will result in the greater abundance of the fruits of the earth. Men always work harder and more readily when they work on that which belongs to them; nay, they learn to love the very soil that yields, in response to the labor of their hands, not only food to eat, but an abundance of good things for themselves and those that are dear to them. That such a spirit of willing labor would add to the produce of the earth and to the wealth of the community is self-evident. And a third advantage would spring from this: men would cling to the country in which they were born; for no one would exchange his country for a foreign land if his own afforded him the means of living a decent and happy life. These three important benefits, however, can be reckoned on only provided that a man's means be not drained and exhausted by excessive taxation. The right to possess private property is derived from nature, not from man; and the State has the right to control its use in the interests of the public good alone, but by no means to absorb it altogether. The State would therefore be unjust and cruel if, under the name of taxation, it were to deprive the private owner of more than is fitting.

"In the last place—employers and workmen may of themselves effect much in the matter we are treating, by means of such associations and organizations as afford opportune aid to those who are in distress, and which draw the two classes more closely together. Among these may be enumerated societies for mutual help; various benevolent foundations established by private persons to provide for the workman, and for his widow

Association.

* Exodus xx. 8. † Genesis ii. 2. ‡ Genesis iii. 19.

or his orphans, in case of sudden calamity, in sickness, and in the event of death; and what are called "patronages," or institutions for the care of boys and girls, for young people, as well as homes for the aged. "The most important of all are working men's unions; for these virtually include all the rest. History attests what excellent results were brought about by the artificers' guilds of olden times. They were the means of affording not only many advantages to the workmen, but in no small degree of promoting the advancement of art, as numerous monuments remain to bear witness. Such unions should be suited to the requirements of this our age—an age of wider education, of different habits, and of far more numerous requirements in daily life. It is gratifying to know that there are actually in existence not a few associations of this nature, consisting either of workmen alone, or of workmen and employers together; but it were greatly to be desired that they should become more numerous and more efficient. We have spoken of them more than once; yet it will be well to explain here how notably they are needed, to show that they exist of their own right, and what should be their organization and their mode of action.

"The consciousness of his own weakness urges man to call in aid from without. We read in the pages of Holy Writ: *It is better that two should be together than one, for they have the advantage of their society. If one fall he shall be supported by the other. Woe to him that is alone, for when he falleth he hath none to lift him up.*" And further: *A brother that is helped by his brother is like a strong city.* It is this natural impulse which binds men together in civil society; and it is likewise this which leads them to join together in associations of citizen with citizen; associations which, it is true, cannot be called societies in the full sense of the word, but which, notwithstanding, are societies.

These lesser societies and the society which constitutes the State differ in many respects, because their immediate purpose and aim are different. Civil society exists for the common good, and hence is concerned with the interests of all in general, albeit with individual interests also in their due place and degree. It is, therefore, called *public society*, because by its agency, as St. Thomas of Aquin says, "Men establish relations in common with one another in the setting up of a commonwealth." But societies which are formed in the bosom of the State are styled *private*, and rightly so, since their immediate purpose is the private advantage of the associates. "Now, a private society," says St. Thomas again, "is one which is formed for the purpose of carrying out private objects; as when two or three enter into partnership with the view of trading in common." Private societies, then, altho they exist within the State, and are severally part of the State, cannot nevertheless be absolutely, and as such, prohibited by the State. For to enter into a 'society' of this kind is the natural right of man; and the State is bound to protect natural rights, not to destroy them; and if it forbid its citizens to form associations, it contradicts the very principle of its own existence; for both they and it exist in virtue of the like principle, namely, the natural tendency of man to dwell in society.

"There are occasions, doubtless, when it is fitting that the law should intervene to prevent association; as when men join together for purposes which are evidently bad, unlawful, or dangerous to the State. In such cases public authority may justly forbid the formation of associations, and may dissolve them if they already exist. But every precaution should be taken not to violate the rights of individuals and not to impose unreasonable regulations under pretense of public benefit. For laws only bind when they are in accordance with right reason, and hence with the eternal law of God."

"And here we are reminded of the Confraternities, societies, and religious orders which have arisen by the Church's authority and the piety of Christian men. The annals of every nation down to our own days bear

witness to what they have accomplished for the human race. It is indisputable that on grounds of reason alone such associations, being perfectly blameless in their objects, possess the sanction of the law of nature. In their religious aspect, they claim rightly to be responsible to the Church alone.

Ecclesiastical Association.

The rulers of the State accordingly have no rights over them, nor can they claim any share in their control; on the contrary, it is the duty of the State to respect and cherish them, and, if need be, to defend them from attack. It is notorious that a very different course has been followed, more especially in our own times. In many places the State authorities have laid violent hands on these communities, and committed manifold injustice against them; this has placed them under control of the civil law, taken away their rights as corporate bodies, and despoiled them of their property. In such property the Church had her rights, each member of the body had his or her rights, and there were also the rights of those who had founded or endowed these communities for a definite purpose, and, furthermore, of those for whose benefit and assistance they had their being. Therefore, we cannot refrain from complaining of such spoliation as unjust and fraught with evil results; and with all the more reason do we complain because, at the very time when the law proclaims that association is free to all, we see that Catholic societies, however peaceful and useful, are hampered in every way, whereas the utmost liberty is conceded to individuals whose purposes are at once hurtful to religion and dangerous to the State.

"Associations of every kind, and especially those of working men, are now far more common than heretofore. As regards many of these there is no need at present to inquire whence they spring, what are their objects, or what the means they employ. There is a good deal of evidence, however, which goes to prove that many of these societies are in the hands of secret leaders, and are managed on principles ill according with Christianity and the public well-being; and that they do their utmost to get within their grasp the whole field of labor, and force working men either to join them or to starve. Under these circumstances Christian working men must do one of two things: either join associations in which their religion will be exposed to peril or form associations among themselves—unite their forces and shake off courageously the yoke of so unrighteous and intolerable an oppression. No one who does not wish to expose man's chief good to extreme risk will for a moment hesitate to say that the second alternative should by all means be adopted.

"Those Catholics are worthy of all praise—and they are not a few—who, understanding what the times require, have striven, by various undertakings and endeavors, to better the condition of the working class without any sacrifice of principle being involved. They have taken up the cause of the working man, and have spared no efforts to better the condition both of families and individuals; to infuse a spirit of equity into the mutual relations of employers and employed; to keep before the eyes of both classes the precepts of duty and the laws of the Gospel—that Gospel which, by inculcating self-restraint, keeps men within the bounds of moderation and tends to establish harmony among the divergent interests and the various classes which compose the State. It is with such ends in view that we see men of eminence meeting together for discussion, for the promotion of concerted action, and for practical work. Others, again, strive to unite working men of various grades into associations, help them with their advice and means, and enable them to obtain fitting and profitable employment. The bishops, on their part, bestow their ready good will and support; and with their approval and guidance, many members of the clergy, both secular and regular, labor assiduously in behalf of the spiritual and mental interests of the members of such associations. And there are not wanting Catholics blessed with affluence, who have, as it were, cast in their lot with the wage-earners, and who have spent large sums in founding and widely spreading benefit and insurance societies, by means of which the working man may without difficulty acquire through his labor not only many present advantages, but also the certainty of honorable support in days to come. How greatly such manifold and earnest activity has benefited the community at large is too well known to require us to dwell upon it. We find therein grounds for most cheering hope in the future, provided always

§ Ibid.

§ Human law is law only by virtue of its accordance with right reason; and thus it is manifest that it flows from the eternal law. And in so far as it deviates from right reason it is called an unjust law; in such case it is no law at all, but rather a species of violence.—St. Thomas of Aquin, *Summa Theologica*, 1a 2æ Q. xciii. Art. 3.

that the associations we have described continue to grow and spread, and are well and wisely administered. Let the State watch over these societies of citizens banded together for the exercise of their rights; but let it not thrust itself into their peculiar concerns and their organization; for things move and live by the spirit inspiring them, and may be killed by the rough grasp of a hand from without.

"In order then that an association may be carried on with unity of purpose and harmony of action, its organization and government should be firm and wise. All such societies, being free to exist, have the further right to adopt such rules and organization as may best conduce to the attainment of their respective objects. We do not judge it expedient to enter into minute particulars touching the subject of organization; this must depend on national character, on practise and experience, on the nature and aim of the work to be done, on the scope of the various trades and employments, and on other circumstances of fact and of time—all of which should be carefully considered.

Catholic Associations.

"To sum up, then, we may lay it down as a general and lasting law, that working men's associations should be so organized and governed as to furnish the best and most suitable means for attaining what is aimed at, that is to say, for helping each individual member to better his condition to the utmost in body, mind, and property. It is clear that they must pay special and chief attention to the duties of religion and morality, and that their internal discipline must be guided very strictly by these weighty considerations; otherwise they would lose wholly their special character, and end by becoming little better than those societies which take no account whatever of religion. What advantage can it be to a working man to obtain by means of a society all that he requires, and to endanger his soul for lack of spiritual food?

*What doth it profit a man if he gain the whole world and suffer the loss of his own soul?** This, as Our Lord teaches, is the mark or character that distinguishes the Christian from the heathen. *After all these things do the heathens seek. . . . Seek ye first the Kingdom of God and his justice, and all these things shall be added unto you.*† Let our associations, then, look first and before all things to God; let religious instruction have therein the foremost place, each one being carefully taught what is his duty to God, what he has to believe, what to hope for, and how he is to work out his salvation; and let all be warned and strengthened with special care against wrong principles and false teaching. Let the working man be urged and led to the worship of God, to the earnest practice of religion, and, among other things, to the keeping holy of Sundays and holydays. Let him learn to reverence and love Holy Church, the common Mother of us all; and hence to obey the precepts of the Church, and to frequent the sacraments, since they are the means ordained by God for obtaining forgiveness of sin and for leading a holy life.

"The foundations of the organization being thus laid in religion, we next proceed to make clear the relations of the members one to another, in order that they may live together in concord and go forward prosperously and with good results. The offices and charges of the society should be apportioned for the good of the society itself, and in such mode that difference in degree or standing should not interfere with unanimity and good will. Office-bearers should be appointed with due prudence and discretion, and each one's charge should be carefully mapped out. Hereby no member will suffer injury. Let the common funds be administered with strict honesty, in such mode that a member may receive assistance in proportion to his necessities. The rights and duties of the employers, as compared with the rights and duties of the employed, ought to be the subject of careful consideration. Should it happen that either a master or a workman believe himself injured, nothing would be more desirable than that a committee should be appointed, composed of reliable and capable members of the association, whose duty would be, conformably with the rules of the association, to settle the dispute. Among the several purposes of a society, one should be to try to arrange for a continuous supply of work at all times and seasons; as well as to create a fund out of which the members may be effectually helped in their needs, not only in cases of accident, but also in sickness, old age, and distress.

"Such rules and regulations, if willingly obeyed by all, will sufficiently insure the well-being of the poor; whilst such mutual associations among Catholics are certain to be productive in no small degree of prosperity to the State. It is not rash to conjecture the future from the past. Age gives way to age, but the events of one century are wonderfully like those of another; for they are directed by the providence of God, who overrules the course of history in accordance with his purposes in creating the race of man. We are told that it was cast as a reproach on the Christians in the early ages of the Church that the greater number among them had to live by begging or by labor. Yet, destitute tho they were of wealth and influence, they ended by winning over to their side the favor of the rich and the good-will of the powerful. They showed themselves industrious, hard-working, assiduous, and peaceable; ruled by justice, and, above all, bound together in brotherly love. In presence of such mode of life and such example, prejudice gave way, the tongue of malevolence was silenced, and the lying legends of ancient superstition little by little yielded to Christian truth.

"At the time being, the condition of the working classes is the pressing question of the hour; and nothing can be of higher interest to all classes of the State than that it should be rightly and reasonably adjusted. But it will be easy for Christian working men to decide it aright if they will form associations, choose wise guides, and follow on the path which, with so much advantage to themselves and the common-weal, was trodden by their fathers before them. Prejudice, it is true, is mighty, and so is the greed of money; but if the sense of what is just and rightful be not debased through depravity of heart, their fellow-citizens are sure to be won over to a kindly feeling toward men whom they see to be in earnest as regards their work, and who prefer so unmistakably right dealing to mere lucre and the sacredness of duty to every other consideration.

"And further great advantage would result from the state of things we are describing; there would exist so much more ground for hope, and likelihood even, of recalling to a sense of their duty those working men who have either given up their faith altogether, or whose lives are at variance with its precepts. Such men feel in most cases that they have been fooled by empty promises and deceived by false pretexts. They cannot but perceive that their grasping employers too often treat them with great inhumanity and hardly care for them outside the profit their labor brings; and if they belong to any union, it is probably one in which there exists, instead of charity and love, that intestine strife which ever accompanies poverty when unresigned and unsustainable by religion. Broken in spirit and worn down in body, how many of them would gladly free themselves from such galling bondage! But human respect, or the dread of starvation, makes them tremble to take the step. To such as these, Catholic associations are of incalculable service, by helping them out of their difficulties, inviting them to companionship, and receiving the returning wanderers to a haven where they may securely find repose.

"We have now laid before you, Venerable Brethren, both who are the persons, and what are the means, whereby this most arduous question must be solved. Every one should put his hand to the work which falls to his share, and that at once and straightway, lest the evil which is already so great become through delay absolutely beyond remedy. Those who rule the State should avail themselves of the laws and institutions of the country; masters and wealthy owners must be mindful of their duty; the poor, whose interests are at stake, should make every lawful and proper effort; and since religion alone, as we said at the beginning, can avail to destroy the evil at its root, all men should rest persuaded that the main thing needful is to return to real Christianity, apart from which all the plans and devices of the wisest will prove of little avail.

"In regard to the Church, her cooperation will never be found lacking, be the time or the occasion what it may; and she will intervene with all the greater effect in proportion as her liberty of action is the more unfettered. Let this be carefully taken to heart by those whose office it is to safe-guard the public welfare. Every minister of holy religion must bring to the struggle the full energy of his mind and all his power of endurance. Moved by your authority, Venerable Brethren, and quickened by your example, they should never cease to urge upon men of every

Conclusion.

class—upon the high-placed as well as the lowly—the Gospel doctrines of Christian life; by every means in their power they must strive to secure the good of the people; and above all must earnestly cherish in themselves, and try to arouse in others, charity, the mistress and the queen of virtues. For the happy results we all long for must be chiefly brought about by the plenteous outpouring of charity; of that true Christian charity which is the fulfilling of the whole Gospel law, which is always ready to sacrifice itself for others' sake, and is man's surest antidote against worldly pride and immoderate love of self; that charity whose office is described and whose Godlike features are outlined by the Apostle St. Paul in these words: *Charity is patient, is kind, . . . seeketh not her own, suffereth all things, . . . endureth all things.** "On each one of you, Venerable Brothers, and on your clergy and people, as an earnest of God's mercy and a mark of our affection, we, lovingly in the Lord, bestow the Apostolic Benediction."

ON THE CHIEF DUTIES OF CHRISTIANS AS CITIZENS.

A portion of the Encyclical Letter of January 10, 1890.

"From day to day it becomes more and more evident how needful it is that the principles of Christian wisdom should be ever borne in mind, and that the life, the morals, and the institutions of nations should be wholly conformed to them. From the fact of these principles having been disregarded, mischiefs so vast have accrued that no right-minded man can face the trials of the time being without grave solicitude, nor contemplate the future without serious alarm. Progress, not inconsiderable indeed, has been made toward securing the well-being of the body and of material things; but all natural advantages that administer to the senses of man, while bringing in their train the possession of wealth, power, and limitless resources, may indeed greatly avail to procure the comforts and increase the enjoyments of life, but are incapable of satisfying the soul created for higher and more glorious benefits. To fix the gaze on God, and to aim earnestly at becoming like him, is the supreme law of the life of man. For we were created in the Divine image and likeness, and are vehemently urged, by our very nature, to return to him from whom we have origin. But not by bodily motion or effort do we make advance toward God, but through acts of the soul, that is, through knowledge and love. God is, in very deed, the primal and supreme truth, and truth the food on which alone the soul is nourished; and God is holiness in perfection and the sovereign good, to which solely the will may aspire and which it may attain, when virtue is its guide.

"But what applies to individual men applies equally to society—domestic alike and civil. Nature did not fashion society with intent that man should seek in it his last end, but that in it and through it he should find suitable aids whereby to attain to his own perfection. If then a civil government strives after external advantages merely, and the attainment of such objects as adorn life; if in administering public affairs it is wont to put God aside, and show no solicitude for the upholding of moral law; it deflects wofully from its right course and from the injunctions of nature; nor should such a gathering together and association of men be accounted as a commonwealth, but only as a deceitful imitation and make-believe of civil organization.

"As to what we have termed the well-being of the soul, which consists chiefly in the practise of the true religion and unswerving observance of the Christian precepts, we perceive that it is daily losing esteem among men, either by reason of forgetfulness or disregard, in such wise that the greater the advance made in the well-being of the body, the greater is the falling away in that of the soul. A striking proof of the lessening and enfeebling of Christian faith is seen in the insults that are, alas! so frequently, in open day, and before our very eyes, offered to the Catholic Church—insults, indeed, to which an age cherishing religion would on no account have submitted. For these reasons how great a multitude of men is involved in danger as to their eternal salvation surpasses belief; but more than this, nations and even vast empires themselves cannot long remain unharmed, since, upon the lapsing of Christian institutions and morality, the main foundations of human society must necessarily be uprooted. Force alone

will remain to preserve public tranquillity and order; force, however, is very feeble when the bulwark of religion has been removed; and being more apt to beget slavery than obedience, it bears within itself the germs of ever increasing troubles. The present century has encountered notable disasters, nor is it clear that some equally terrible are not impending. The very times in which we live are warning us to seek remedies there where alone they are to be found—namely, by reestablishing in the family circle and throughout the whole range of society the doctrines and practises of the Christian religion. In this lies the sole means of freeing us from the ills now weighing us down, of forestalling the dangers now threatening the world. For the accomplishment of this end, Venerable Brothers, we must bring to bear all the activity and diligence that lie within our power. Altho we have already, under other circumstances, and whenever occasion required, treated of these matters in other letters, we deem it expedient, in this message to you, to define more in detail the duties of Catholics, inasmuch as these would, if strictly observed, avail with wondrous power to save society in all its length and breadth. We are engaged, as regards matters of highest moment, in a violent and well-nigh daily struggle, wherein it is hard at times for the minds of many not to be deluded, not to go astray, not to yield. It behooves us, Venerable Brothers, to warn, instruct, and exhort each of the faithful with an earnestness befitting the occasion; *that none may abandon the way of truth.*

"It cannot be doubted that duties more numerous and of greater moment devolve on Catholics than upon such as are either not sufficiently enlightened in relation to the Catholic faith, or who are entirely unacquainted with its doctrines. Considering that forthwith upon salvation being wrought out for mankind, Jesus Christ laid upon his apostles the injunction to *preach the Gospel to every creature*, he imposed, it is evident, upon all men the duty of learning thoroughly and believing what they were taught. This duty is intimately bound up with the gaining of eternal salvation: *He that believeth and is baptized shall be saved; but he that believeth not, shall be condemned.** But the man who has embraced the Christian faith, as in duty bound, is by that very fact a subject of the Church as one of the children born of her, and becomes a member of that greatest and holiest body, which it is the special charge of the Roman Pontiff to rule with supreme power, under its invisible Head, Christ Jesus. Now, if the natural law enjoins to love devotedly and to defend the country in which we had birth, and in which we were brought up, so that every good citizen hesitates not to face death for his native land, very much more is it the urgent duty of Christians to be ever quickened by like feelings toward the Church. For the Church is the holy City of the living God, born of God himself, and by him built up and established. Upon this earth indeed she accomplishes her pilgrimage, but by instructing and guiding men, she summons them to eternal happiness. We are bound then to love dearly the country whence we have received the means of enjoyment this mortal life affords, but we have a much more urgent obligation to love, with ardent love, the Church to which we owe the life of the soul, a life that will endure forever. For fitting it is to prefer the good of the soul to the well-being of the body, inasmuch as duties toward God are of a far more hallowed character than those toward men.

"Moreover, if we would judge aright, the supernatural love for the Church and the natural love of our own country proceed from the same eternal principle, since God himself is their Author and originating Cause. Consequently it follows that between the duties they respectively enjoin, neither can come into collision with the other. We can, certainly, and should love ourselves, bear ourselves kindly toward our fellow-men, nourish affection for the State and the governing powers; but at the same time we can and must cherish toward the Church a feeling of filial piety, and love God with the deepest love of which we are capable. The order of precedence of these duties is, however, at times, either under the stress of public calamities, or through the perverse will of men, inverted. For instances occur where the State seems to require from men as subjects one thing, and religion, from men as Christians quite another; and this in reality without any other ground, than that the rulers of the State either hold the sacred power of the Church of no ac-

Godless Government.

* 1 Corinthians xiii. 4-7.

* Mark xvi. 16.

count, or endeavor to subject it to their own will. Hence arises a conflict, and on occasion, through such conflict, of virtue being put to the proof. The two powers are confronted and urge their behests in a contrary sense; to obey both is wholly impossible. *No man can serve two masters.** for to please the one amounts to contemning the other. As to which should be preferred no one ought to balance for an instant. It is a high crime indeed to withdraw allegiance from God in order to please men; an act of consummate wickedness to break the laws of Jesus Christ, in order to yield obedience to earthly rulers, or, under pretext of keeping the civil law, to ignore the rights of the Church; *we ought to obey God rather than men.*† This answer, which of old Peter and the other apostles were used to give the civil authorities who enjoined unrighteous things, we must, in like circumstances, give always and without hesitation. No better citizen is there, whether in time of peace or war, than the Christian who is mindful of his duty; but such a one should be ready to suffer all things, even death itself, rather than abandon the cause of God or of the Church.

The State.

Hence they who blame, and call by the name of sedition, this steadfastness of attitude in the choice of duty, have not rightly apprehended the force and nature of true law. We are speaking of matters widely known, and which we have before now more than once fully explained. Law is of its very essence a mandate of right reason, proclaimed by a properly constituted authority, for the common good. But true and legitimate authority is void of sanction, unless it proceed from God the supreme Ruler and Lord of all. The Almighty alone can commit power to a man over his fellow-men; nor may that be accounted as right reason which is in disaccord with truth and with divine reason; nor that held to be true good, which is repugnant to the supreme and unchangeable good, or that wrests aside and draws away the wills of men from the charity of God.

Hallowed therefore in the mind of Christians is the very idea of public authority, in which they recognize some likeness and symbol as it were of the Divine Majesty, even when it is exercised by one unworthy. A just and due reverence to the laws abides in them, not from force and threats, but from a consciousness of duty, *for God hath not given us the spirit of fear.*‡
 "But if the laws of the State are manifestly at variance with the divine law, containing enactments hurtful to the Church, or conveying injunctions adverse to the duties imposed by religion, or if they violate in the person of the supreme pontiff the authority of Jesus Christ, then truly, to resist becomes a positive duty; to obey, a crime; a crime moreover combined with misdemeanor against the State itself, inasmuch as every offense leveled against religion is also a sin against the State. Here anew it becomes evident how unjust is the reproach of sedition; for the obedience due to rulers and legislators is not refused; but there is a deviation from their will in those precepts only which they have no power to enjoin. Commands that are issued adversely to the honor due to God, and hence are beyond the scope of justice, must be looked upon as anything rather than laws. You are fully aware, Venerable Brothers, that this is the very contention of the Apostle St. Paul, who, in writing to Titus, after reminding Christians that they are to be subject to princes and powers and to obey at a word, at once adds, *And to be ready to every good work.*|| Thereby he openly declares that if laws of men contain injunctions contrary to the eternal law of God, it is right not to obey them, in like manner the Prince of the Apostles gave this courageous and sublime answer to those who would have deprived him of the liberty of preaching the Gospel; *if it be just in the sight of God to hear you rather than God, judge ye, for we cannot but speak the things which we have seen and heard.*§

Wherefore, to love both countries, that of earth below and that of heaven above, yet in such mode that the love of our heavenly surpass the love of our earthly home, and that human laws be never set above the Divine law, is the essential duty of Christians, and the fountain-head, so to say, from which all other duties spring. The Redeemer of mankind of himself has said: *For this is I born, and for this*

*came I into the world, that I should give testimony to the truth.** In like manner *I am come to cast fire upon earth, and what will I but that it be kindled?†* In the knowledge of this truth, which constitutes the highest perfection of the mind; in divine charity which, in like manner, completes the will, all Christian life and liberty abide. This noble patrimony of truth and charity intrusted by Jesus Christ to the Church, she defends and maintains ever with untiring endeavor and watchfulness."

Laws Invalid which are Against those of God.

 § Acts iv. 19, 20.

ROOSEVELT, THEODORE, was born in New York City in 1858. From private schools in New York he went to Harvard University and was graduated in 1880. Traveling in Europe and making some hunting expeditions in the West, he returned to New York and took part in the politics of his own ward and was sent to the Assembly in 1883, 1884, and 1885, where he made a record as an independent Republican and a relentless foe of political jobbery and corruption. He procured the Roosevelt investigation and some administrative reforms. In 1886 he was Republican candidate for mayor against Abram S. Hewitt and Henry George. In 1889 he was appointed Civil Service Commissioner and he threw himself actively into the work, which he continued till 1895, when he accepted a position on the city police board, thinking that the "storm center" was there. By his vigorous enforcement of Sunday-closing laws he has made many friends and also bitter enemies. Among his published writings are *Naval War of 1812* (1881); *The Winning of the West* (4 vols., 1889-1895); *Essays on Practical Politics* (1892).

ROSCHER, WILHELM GEORG FRIEDRICH, was born in 1817, in Hanover, and studied at Göttingen and Berlin. In 1838 he took the degree of doctor of philosophy at Göttingen, where, in 1840, he became privatdocent for history and economics. In 1843 he was appointed extraordinary, and 1844, ordinary professor. In 1848 he was called to Leipzig, where he remained, tho with repeated calls to other universities—Münich, Vienna, and Berlin—till his death in 1894.

Dr. Roscher has achieved a lasting fame as the founder of the historical school of political economy, and many learned associations have delighted to do him honor. Professor Cohn says of him:

"In the foremost rank we must place a man, who shortly before had acquired a reputation by a philological-historical work, and then turned to political economy, Wilhelm Roscher. His *Vorlesungen über Staatswirtschaft nach geschichtlicher Methode* (Lectures on State Economy on Historical Method) were only the outlines of his lectures. . . . but the one happy analogy by which Roscher applied the results of the historical school to political economy was a scientific achievement. The conclusions which he drew from this analogy, in regard to the mission of the historical school of political economy, are the same which the historical school of law had drawn for their science a generation previous—even his quotations from Justus Möser and Bacon are borrowed from Savigny; nevertheless, the service he rendered to our science is a great and lasting one.

"Roscher's conclusions as to the mission of political economy were as follows:

"(1) The study of the economy of the State is a political science, whose mission is to understand men, and control men. . . . (2) We need an investigation of the earlier stages of civilization in order to under-

* John xviii. 37.

† Luke xii. 49.

stand the nature of modern civilization; and further of (3) the economic development of different nations, with especial reference to the nations of classic antiquity, whose development lies before us in its totality. (4) Out of all this arises the practical demand which the science makes upon us, viz.: the task of constructing modern measures of economic policy on an historical basis, or in other words, learning what is suited for the present time by studying the historical growth of individual institutions."

Among Roscher's most important works are *Grundriss zu Vorlesungen über die Staatswirthschaft nach geschichtlicher Methode* (1843); *System der Volkswirtschaft*, vol. i.; *Die Grundlagen der Nationalökonomik* (1854); vol. ii., *Nationalökonomie des Ackerbaues und der verwandten Urproduktionszweige* (1859); vol. iii., *Nationalökonomie des Handels und Gewerbetreibendes* (1881); vol. iv., *System der Finanzwissenschaft* (1886); *Ansichten der Volkswirtschaft aus dem geschichtlichen Standpunkte* (1861).

ROSS, EDWARD ALSWORTH, was born in 1866, in Illinois. He was graduated from Coe College, Iowa, in 1886. After teaching two years, he went abroad in 1888, studying in Berlin. In 1890 he entered Johns Hopkins University, Baltimore, from which he received the degree of Ph. D. in 1891. In 1891-92 he was professor of economics and social science in Indiana University and during 1892-93 associate professor of political economy in Cornell University. In 1893 he was appointed professor of finance and administration in Leland Stanford, Jr., University, which position he now holds. He has written numerous articles; among others: *Sinking Funds* (American Economical Association, vol. vii. Nos. 4, 5); *A New Canon of Taxation* (*Political Science Quarterly*, December, 1892); *The Standard of Deferred Payments* (*Annals of American Academy*, November, 1892); *Total Utility Standard of Deferred Payments* (*Annals*, November, 1893); (Seligman's) *Shifting and Incidence of Taxation* (*Annals*, January, 1893); (Argyll's) *Unseen Foundations of Society* (*Political Science Quarterly*, December, 1893).

ROUSSEAU, JEAN JACQUES, was born at Geneva, June 28, 1712, of French parentage. His mother dying when he was very young, his dissipated father abandoned him and he was taken charge of by a relative and placed under the tutorship of a clergyman at Bossey. In his twelfth year he was apprenticed to a notary, and a year later to an engraver. But in 1828 he ran away, and in Savoy came under the protection of Mme. de Warens, but soon left and went through a variety of experiences, for a short time being footman to Mme. de Vercellis in Turin. Later he returned to Mme. de Warens and became her lover as well as her protégé. His tendency to wander took him away from her for a time; returning to find her gone, he resumed his wanderings and adventures. In 1732 he went to Paris and secured a position in the service of Sardinia, but found Mme. de Warens again and was installed in her household, and when his health failed he went with her to Chambray,

passing the time with music and reading. In 1778 he went to Montpellier, and in 1780 became tutor to the children of M. de Mably, the writer. In 1741 he returned to Paris and read a paper on the theory of music before the Academy of Sciences, but being unfavorably received, he was for a year and a half secretary to M. de Montagne, French ambassador at Venice. He then returned to Paris, still a wanderer, now and again led into immorality, yet making friends and earning a precarious living by copying music and acting as secretary to Mme. Dapin. At this time, however, he married a servant girl, Thérèse Levasseur. Five children were born to them, but all were committed to the foundling hospital. He now gained some literary notoriety. An opera of his, *Les Muses Galantes*, was privately represented. Diderot accepted him as a contributor to his *Encyclopédie*. In 1749 he won the prize offered by the Academy of Dijon for an essay on the effect of the progress of civilization, arguing the superiority of the state of nature. Its publication in 1750 made him famous. His *Divin du Village* was produced at Fontainebleau in 1752, and he was invited at court, but he declined.

Having embraced the Catholic faith in 1754, he returned to Protestantism and went to Geneva as a free citizen, but in 1756 returned to Paris and occupied the "Hermitage" for a year, during which time he wrote *La Nouvelle Héloïse*, which appeared in 1760. He quarreled with his friends and left, going to Montmorency. Here he wrote against the drama, attacking also Voltaire and Diderot. In 1762 he produced at Amsterdam *Le Contrat Social*, for which he received 1000 louis, and the same year *Émile*, a treatise on education, for which he received 6000 louis. He was now generally attacked, by the Conservatives for his *Le Contrat Social*, by the moralists for his *Nouvelle Héloïse*, by the Church for his *Émile*. In 1762 he fled from a threatened arrest and escaped to Switzerland and then to Prussia, where Frederick II. seemed willing to protect him, and from whence he wrote letters denouncing his enemies. But here he was attacked by the populace and he fled to Isle St. Pierre in the Lake of Burme till ordered to leave by the Swiss government. He eventually went, invited by David Hume, to England, which he reached in 1766. Partly lionized and partly condemned in London, he went to Derbyshire, where he wrote most of his *Confessions*. He quarreled, however, with Hume and other English friends, and being made to believe that he was being plotted against by the King of Prussia he fled to France in 1767, where he wandered from place to place, finishing his *Confessions*, and at last going to Paris and earning a living by copying music. He was welcomed and aided by the Marquis de Mirabeau and others, but quarreled with all friends and was thought by some to be at this time half insane. He died in a fit of apoplexy July 2, 1778, leaving many smaller writings besides the above-mentioned works and a mass of correspondence.

(For a review of his social teachings, see article NATURAL RIGHTS.)

RUGE, ARNOLD, was born at Bergen, island of Rügen, in 1802. He studied philology and philosophy at Halle, Jena, and Heidelberg, but in 1824 was imprisoned for five years at Colberg, for membership in a secret political society. In 1831 he was appointed professor of esthetics at Halle, and attracted much attention as a philosophical critic. In 1843 he joined Karl Marx (*g. v.*) in Paris, and they published the *Deutsch-französische Jahrbücher* (1843-45). He was elected to the German Parliament in 1848, and the same year founded the paper *Reform* at Berlin. This was soon suppressed, and after attempts at revolutionary intrigue in Dresden and Carlsruhe he went to London in 1849 and formed a European Democratic committee with Ledru-Rollin and Mazzini in London. He died at Brighton December 31, 1880. Besides the above-mentioned works he published *Zwei Jahre in Paris* (1845); *Poetische Bilder* and *Politische Bilder* (1847); *Unser System* (1850); *Ausfrüherer Zeit* (1862-67); *Manifest an das deutsche Volk* (1886).

RUSH, BENJAMIN, was born at Byberry near Philadelphia, in 1746. He studied medicine in Philadelphia, Edinburgh, London, and Paris, and began practice in Philadelphia in 1769, and was made professor of chemistry in the medical college there. In the provincial conference in Pennsylvania he moved the resolution to formulate its sentiments for a Declaration of Independence, was chosen to the Continental Congress, and became one of the signers to the Declaration of Independence. He was married the same year to Julia Stockton. Dr. Rush was made surgeon-general of the middle department of the army, and soon after physician-general.

In 1778 he resigned his position because of wrongs done to the soldiers in regard to the hospital stores, and resumed practise in Philadelphia. About 1785 he planned there the first dispensary in the United States.

In the State convention he was a staunch supporter of the Federal Constitution. He was a member of the convention of Pennsylvania to form a State Constitution.

While the yellow fever prevailed in Philadelphia in 1793, Dr. Rush was estimated by Dr. Ramsay to have saved 6000 persons in Philadelphia from death by that disease, and received many honors therefor from Europe as well as America. He was president of the Society for the Abolition of Slavery and of many other moral and religious societies, and a frequent writer on reform themes. He was treasurer of the United States Mint from 1799 till his death in 1813.

RUSKIN, JOHN, was born in London in 1819, the son of a wealthy wine merchant. He was educated at home and at Christ Church, Oxford. He then devoted himself to painting, under J. D. Harding and Copley Fielding. In 1843 he published the first volume of *Modern Painters*, the noted defense of Turner's art. He published the second volume in 1846; and the remaining volumes in 1856 and 1860, after a residence in Italy and

a careful study of Italian art. In 1849 appeared the *Seven Lamps of Architecture*, and from 1851 to 1853, the three volumes of the *Stones of Venice*. In 1869 he was elected Slade professor of fine arts at Oxford, and re-elected in 1876 and 1883; failing health compelled him to resign in 1884, since when he has lived in retirement at Brantwood, Coniston. His first writing on economic subjects was *Unto this Last*, essays republished from the *Cornhill Magazine* in 1862. This, with *Munera Pulveris* (1862-63), *The Crown of Wild Olive* (1866), and the letters to working men, *Fors Clavigera* (1871-84), embody his economic teachings. He and Carlyle may be said to be the prophets of the modern English socialist movement.

The essence of his social teaching may, perhaps, be put in one of his own phrases: "There is no wealth but life; life including all its powers of love, of joy, and of admiration."

From this teaching springs all else. Because noble life is wealth it follows, with Ruskin, that that country is richest which nourishes the greatest number of noble and happy human beings; that that man is wealthiest, who, having perfected the functions of his own life to the utmost, has also the widest helpful influence, both personal and by means of his possessions, over the lives of others.

Moreover, because life is wealth, it follows that only that which contributes life has a right to return in wealth; hence *interest*, the return of money for the use of dead money, is wrong—only those have a right to share in the products of industry who have put into the operation some industry themselves, some outgo of their own life.

These two conceptions, the law of wealth and the law of service, run through all of Ruskin's works. He teaches that wealth is "the possession of the valuable by the valiant"; that service bids English men and women to become "Soldiers of the Plowshare as well as Soldiers of the Sword."

Ruskin taught from these principles, *first*, the law of "Property to whom proper"—or that land and tools belong to those who can use them; *secondly*, that he who can, should use his tools—use his tools to develop life, the highest life in himself and others; *thirdly*, that this highest life can only be by cooperation instead of competition, the thought of what we can give rather than of what we can get, the thought of what we are rather than of what we have. This, added to Ruskin's teaching as regards art, constitutes Ruskin's social system. His theory of art and his theory of society he never divorces, because they are both part of his one theory of life. Of art he taught—he himself tells us, first, that the life of art is in religion; secondly, that its food is in the ocular and passionate love of nature; thirdly, that its health is in the humility of the artists. Applying this to his social teaching, his outcome was that society should be a cooperation or communism of artists, submitting themselves humbly to the law of love, and in the joy of beauty working to produce the highest and the noblest that is in them.

Ruskin calls himself a Communist—in his own phrase, “the reddest of the red.” Yet, in equality of property he did not believe. In creating his St. George’s Guild he distinctly says that there should be “no equality upon it, but recognition of every betterness, and reprobation of every worseness.” This certainly is opposed to communism, but is in accord with some socialism. In almost all things Ruskin is a socialist. He believes in government, in the State; he believes in the cooperation of workers in the State; he believes in award for worth; he does not believe in interest; he does not believe in the capitalist; he is the bitterest foe of the wage system and of the *laissez-faire* political economy.

Ruskin is not, however, a socialist in all things. He is politically (in his writings) a conservative. His socialism is paternal, not fraternal. He would not seek for reform through political action. He shrinks from the rough and prosaic machinery of politics. The Gospel of Art has rarely been married to the Gospel of the Ballot Box. Hence, politically, Ruskin becomes reactionary.

Yet Ruskin attempted the concrete, altho this not so much for the value of the concrete itself, as because, in trying to carry out his ideas, he could alone be consistent. His St. George’s Guild was an inevitable consequence of his teaching.

“The more I see of writing,” he says, “the less I care for it; one may do more with a man by getting to words spoken to him, face to face, than by the black-lettering of a whole life’s thought.”

A valuable account of the Guild may be found in Edward Cook’s *Studies in Ruskin*:

“It was in May, 1871,” says Mr. Cook, “that the scheme was first made public. In the *Fors* for that month Mr. Ruskin called on any landlords to come and help him who would like better to be served by men than by iron devils, and any tenants, and any workmen who could vow to work and live faithfully for the sake of the joy of their home. All who joined St. George’s standard were to do as Mr. Ruskin undertook to do; to give the tenth of what they had and what they earned, not to emigrate with, but to stay in England with, and to make a happy England of her once more.”

The Guild had an agricultural, an industrial, and an artistic character. On land bought by the Guild, to which Ruskin himself largely contributed, an attempt was made to carry on an agricultural community according to Ruskin’s *Law of Life*. Mr. Cook says of this:

“The agricultural experiments of the St. George’s Guild have not been a brilliant success. Perhaps they have not been given a fair chance. Perhaps the times and seasons have been unpropitious. But whatever explanations or excuses there may be, the fact remains that the St. George’s farms have produced very little except a plentiful crop of disappointments. Mr. Ruskin has drawn many charming pictures of his ideal settlements; but the realities have for the most part been either grim or grotesque, or (more often) both. The Guild is, however, the owner of several acres of land in different parts of the country, and there is some reason to hope that past failures will lead to future successes.”

Other industrial experiments of Mr. Ruskin have been in the way of fostering village industries. He writes: “Whatever may be the destiny of London, or Paris, or Rome in the future, I have always taught that the problem of right organization of country life was wholly independent of them.”

Mr. Ruskin’s aim was not to organize industrial villages, but to revive, in existing villages, village industry.

Foremost in work in this direction stands Mr. Albert Flemming’s attempt, under Ruskin’s influence, to

bring back the old industry of the spinning-wheel to the homes and villages of Westmoreland. In a measure it has succeeded, as one can see by reading Mr. Flemming’s own account of it, printed in *Studies in Ruskin*.

Another experiment was the making of “St. George’s cloth” in the Isle of Man, undertaken with Ruskin’s help by Mr. Egbert Rydings. A mill was built in romantic architecture by the St. George’s Guild, the motive power being water and not steam. This still exists, tho it has passed into other hands than those of the Guild.

The main concrete result of the St. George’s Guild, has, however, not unnaturally, been artistic, in the creation and maintenance of the unique and beautiful Ruskin Museum at Meresbrook Hall, Sheffield.

Besides these industrial experiments Ruskin has largely used his inheritance of some £200,000, by aiding Miss Octavia Hill (see TENEMENTS) in her model tenement experiments, in making loans without interest, and in other philanthropic ways.

RUSKIN COOPERATIVE COLONY.—

In 1893 Mr. J. A. Wayland, editor of *The Coming Nation*, conceived the idea of establishing a cooperative colony to be operated as nearly upon the plans laid down in Bellamy’s *Looking Backward* as the present competitive system would permit. From among the great number of *Coming Nation* workers he selected a few cooperators, formulated a set of by-laws, and in May, 1894, was ready to seek the colony’s location. One thousand acres of land near Tennessee City, Tenn., were finally chosen, and in July the movement from Greensburg, Ind., took place. On August 24, 1894, the colonists formally organized as the Ruskin Cooperative Association under the joint-stock corporation laws of the State of Tennessee.

A temporary printing house had been erected at Tennessee City, and in October the erection of temporary homes for the colonists was commenced upon the land, which lies two miles north of Tennessee City.

All prospered, but in 1895 differences arose and Mr. Wayland left the colony, and the colony later removed to a more favorable location called Cave Mills, six miles from Tennessee City. Its declared objects are to own and operate manufactories, to acquire land, to build homes for its members, to insure protection against want or the fear of want, to provide educational and recreative facilities of the highest order, and to promote and maintain harmonious social relations on the basis of cooperation.

According to its rules, a share of stock costs \$500. All members must hold one share but cannot hold more. For the benefit of those who cannot pay at one time a plan of instalments has been adopted, which will be mailed on application. The stock is non-transferable, except to the association.

The colony publishes *The Coming Nation*, a socialist journal, with probably the largest circulation of any social reform paper in the United States.

RUSSIA AND SOCIAL REFORM.—The most important social reform movement in

Russia is Nihilism (*q. v.*). See also MIR. Here we consider, first,

I. STATISTICS.

The Government is an absolute hereditary monarchy. The administration is intrusted to boards or councils: (1) *The Council of State*, established in 1810, with members appointed by the Emperor, and whose chief function is to examine into laws and budgets; (2) *The Ruling Senate*, established in 1711, which is partly deliberative and partly executive, which promulgates laws and acts as a high court of justice; (3) *The Holy Synod*, which superintends religious affairs; (4) *The Committee of Ministers*, consisting of 12 ministers, 4 grand dukes, and 6 other functionaries.

The empire is divided into general governments or vice-royalties: Finland, Poland, Wilna, Kieff, Moscow, Caucasus, Turkestan, Steppeno, Irkutsk, and Amur, with 78 governments and many hundred districts. European Russia has 107,676 communes, with a large degree of self-government and election by the Mir (*q. v.*), composed of householders, men or women. These communes are united into cantons or *Volosts* (in Poland *Graina*, which, however, has less authority than the *Voloste*). In 1890, chiefs of the district, nominated by the administration from the nobility, took the places of former justices of the peace elected by the peasantry. *Zemstvos* or district assemblies of representatives of peasantry, households, and nobles have still some power, but by laws of 1890 and 1894 are being replaced by governors nominated by the emperor.

Area and Population. The empire composes one-seventh of the land surface of the globe, and covers 8,644,000 English square miles. The total population was estimated in 1895 at 129,595,000. In 1722 it was estimated at 14,000,000; 1812 at 41,000,000; 1851 at 68,000,000; 1867 at 81,000,000; 1886 at 113,000,000. It was divided as follows in 1892:

	AREA IN SQ. MILES.	POPULATION.	PER SQ. M.
European Russia (1892).....	1,902,029	91,212,888	48
Poland (1893).....	49,157	8,982,253	182
Finland (1893).....	144,255	2,431,953	19
Siberia.....	4,833,496	4,993,281	1
Total Asia.....	6,564,778	19,234,687	3

The birth rate in all portions of the empire largely exceeds the death rate.

Fourteen million live in towns, 102,000,000 in the country; St. Petersburg, Moscow, Warsaw, and Odessa being the largest cities. The established religion is that of the Greek Church; the Emperor is its head, and appoints to every office. Seventy-three millions of the inhabitants are said to be of this church, 8,000,000 Roman Catholics; 3,000,000 each Protestants and Jews;

2,500,000 Mohammedans. There are 3 metropolitans, 12 archbishops, and 47 bishops, with 63,171 churches.

Education is under control of the Minister of Education, with about 9 universities, 25 higher schools, 368 professional, 1026 middle schools, and 46,880 primary schools.

In 1894 the ordinary revenue was 1,153,785,812 r. and the ordinary expenditure 991,197,437 r., the ruble being worth about 50 cents; the extraordinary revenue was 84,056,130 r. and the extraordinary expenditure 163,944,225 r.

Finances. The budget for 1896 estimates the total revenue at 1,361,547,994 r. Direct taxes were estimated at 104,000,000 r.; customs, 153,000,000 r.; excise and stamp duties, 451,000,000 r. (spirits, 284,000,000 r.); mints, mines, post, and telegraph, 44,000,000 r.; State domains, 294,000,000 r.; reimbursement of railway loans, 60,000,000 r.

The ordinary expenditures were estimated at 1,219,088,414 r., with 139,459,580 r. for extraordinary railway and post expenditures. Two hundred and fifteen

million rubles were estimated for interest on debts; 28,000,000 r. for war; 13,000,000 r. for the Imperial household; 106,000,000 r. for ways and communications.

In 1892 in European Russia the State owned 410,000,000 acres, the Imperial family 10,000,000, the peasants 373,000,000, and other private owners 294,000,000. Twenty-six per cent was arable; 15 per cent, was grazing; 38 per cent, forests, and 19 per cent, unfit for culture, or in roads, etc. In 1893 exports were 613,000,000 r., and the imports were 463,000,000 r. Grain forms about one-half the exports to Europe. The chief imports were raw cotton, machinery, and metal goods.

Industries. In 1890 the value of gold mined was \$25,802,175, of pig-iron in 1892, \$16,968,000; coal, \$9,648,000; petroleum, \$7,288,275.

(For railways see RAILWAYS.) Manufacturing (including mining) amounted in value in 1890 to 1,656,000,000 r., irrespective of the smaller industries, of which 487,100,000 r. was in the cotton industry, the number of spindles in Russia being one-fourth of those in Europe. The merchant sea fleet of Russia numbers 2870 sailing vessels on foreign seas; steamers 486. There are 398 fairs, of which the greatest is Nijni Novgorod, to which in 1890 goods were shipped and nearly all sold, valued at 181,256,830 r.

II. SOCIAL REFORM.

In 1861 Alexander II. decreed the emancipation of the serfs, but under such conditions that it was a doubtful blessing. Only one-third of the land was divided among the serfs; one-sixth was left to the landed nobility, and one-half was kept for the State. The result is that the peasants do not have enough to support themselves upon, while they are at the same time heavily taxed on the little land they have. They are thus deprived of the old feudal rights, and not given economic basis enough to support them under modern individualism. The result is that they are often compelled to sell what little land they have to the landed nobility, while many escape as "illegal men" to beg, or seek a precarious existence in the cities. Sometimes a whole village will decamp in the night to the steppes to avoid the tax-collector. It has been estimated that 20,000,000, or a third of the rural population, are absolutely proletarians. It is this condition that has produced Nihilism (*q. v.*), which is growing into a tendency toward modern socialism, tho many look for social reform, not through the ideals of Western socialism, but from the old communism of Holy Russia and her ancient Mirs freed from the subjection to the Tatar czars. Meanwhile, the condition of the people is desperate. According to the report on Russia of the Royal (English) Commission on Labor, the wages of the Russian miners were from 1 ruble to 1.45 per day; of railroad employees, many of whom are women, only from 30 kopecks to 1 ruble, and agricultural wages only about 60 kopecks, the ruble being equal to about 77 cents, and the kopeck one-hundredth of a ruble. In St. Petersburg wages are higher, but large multitudes can get no work at any price.

Cranford, U. S. Consul-General to Russia (5 vols., 1893); also, the Report on Russia of the (English) Royal Commission on Labor. See also NIHILISM.

S

SAINT-SIMON, CLAUDE HENRI COMTE DE, was born in Paris in 1760, of a noble family tracing its origin to Charlemagne. He entered the army at the age of 16, and a year afterward came to America and fought under Washington. He took part in the siege of Yorktown, and distinguished himself for bravery. Upon returning to France he was made colonel, but soon resigned his position and gave up the military career. He visited Mexico and started a project for uniting the Atlantic with the Pacific by a canal. A few years later he formed designs for a canal from Madrid to the ocean, but the French Revolution drew him to France. In spite of his family traditions, he sided with the people; and was elected president of the commune where his property was situated. He renounced his title of count, saying that he regarded it as inferior to that of citizen; and refused an office that was offered him, for fear it should be thought he owed it to his rank. All this, however, did not prevent his imprisonment for nearly a year on account of his nobility. Acquiring some money by speculation he contracted an unhappy marriage, which was later dissolved. He began scientific studies, and in order to acquire a complete knowledge of life he plunged deliberately on occasions into dissipation. When his money was spent and his health broken, he changed his mode of life and became a copying clerk, working nine hours a day for less than \$200 a year. It was not till his forty-ninth year that he felt himself fully qualified to appear as a social reformer. He wrote two works—*Sur la Science de l'Homme* and *Sur la Gravitation Universelle*. His characteristic socialist views were first developed in *L'Industrie* (1817) and further developed in *L'Organisation* (1819), *Du Système Industriel* (1821), *Catechisme des Industriels* (1823), and most important of all, *Nouveau Christianisme* (1825). In the latter work, having previously called in vain upon the Pope to head a new Crusade of the Church against poverty and suffering, he outlines a new Christianity where with religious fervor the world should be exploited in a scientific way, and society organized for the benefit of the poor and of all classes. His works, however, at first elicited little attention.

At 60 years of age his marvelous tenacity gave way, and, influenced by despondent thoughts, he attempted suicide. This brought dilatory friends to his side, and he rallied and set to work again. In 1825 he died in the midst of his followers. One of them has chronicled his last words. Calling his friends around him, he said:

"You have arrived at a period when, by your combined efforts, you will achieve a great success. The fruit is ripe; you are able to gather it. The last of my labors, the *New Christianity*, will not be immediately understood. It has been thought that every religious system ought to disappear because men have succeeded in proving the weakness and insufficiency of Catholicism. People are deceived in this. Religion cannot disappear from the world; it can only be changed. . . ."

"He paused for a few moments, then, in the final struggle, added: 'The Party of Laborers will soon be formed; the future is ours.' After having said these words, he raised his hand to his head and died."

Professor Ely says, in speaking of Saint-Simon:

"Saint-Simonism is the first example of pure socialism, by which I understand an economic system in which production is entirely carried on in common, and the fruits of labor distributed according to some ideal standard, which appears to the promoters of the scheme just. The Saint-Simonians held that men were by nature unequal, and that it was right to reward superior power, when exerted for the general good. Their idea was that each one should labor according to his capacity and be rewarded according to the services rendered. They wished to organize civil society on the plan of an army. This thought is distinctly expressed by one of their leaders in these words: 'In the army gradations in rank and authority are already established, while in civil life that is precisely what is wanting; and in an enterprise conducted upon the principle of association, a central administration is imperiously required.' The officers are the directing authority in the scheme, and they decide on the value of the services rendered to society and reward the citizens accordingly. As society consists of priests, savants, and industrials—the industrials comprising those engaged in manufactures, agriculture, and commerce—so the Government consists of the chiefs of the priests, the chiefs of the savants, and the chiefs of the industrials. All property belongs to the Church, *i. e.*, to the State, and every profession or trade is a religious exercise and has its rank in the social hierarchy."

After Saint-Simon's death his followers became numerous, especially about 1830, under the leadership of Enfantin and Bazard (*q. v.*). The *Globe*, their organ, attracted much attention. Brilliant men like Comte and Thierry belonged for a while to their school. They attempted a community at Menilmontant, but it broke up finally in a split on the subject of marriage (see BAZARD).

The Saint-Simonians regarded all idlers as thieves. They therefore rejected inheritance, and asserted that every man's property at death should become common. All should start with equal advantages. Land, capital, and all the instruments of labor should be held in common. They believed in monogamy, that woman is the equal of man, and that the social unit should not be man, but man and woman. They believed that "the exploitation of man by man" should be replaced by the exploitation of the globe by man associated with man. They would organize society on scientific lines to develop the globe scientifically. Several of the school after its break up became civil engineers and took part in opening the Isthmus of Suez and other works.

SALVATION ARMY, THE SOCIAL REFORM WORK OF THE.—The Salvation Army, which was organized under that name in 1878 by General Booth (*q. v.*) as an outgrowth of the Christian Mission he had established in East London in 1865, commenced in 1890 a social reform movement, which we outline here. With the strictly religious portion of the work of the Salvation Army we do not deal in this Encyclopedia, tho it should be recognized that the Army never divorces its social from its

more strictly spiritual work, and believes that to do so would be fatal. It believes that the social work needs the spiritual element, even as practical experience convinced General Booth that the spiritual work needed the social reform element and could not be continued without it.

It was in this thought that in 1890 General Booth wrote and published his *In Darkest England*, a book which at once arrested attention around the world; partly because of its revelations of the destitution and wretchedness in London and all England, and even more because of the plan for social work that the book proposed in clear, businesslike form.

General Booth prefaced his plan by laying down seven propositions, which in his opinion should govern such a plan, which we abridge from his book (p. 85), as follows:

"The first essential that must be borne in mind as governing every scheme that may be put forward is that it must change the man, when it is his character and conduct which constitute the reasons for his failure in the battle of life.

Principles.

No change in circumstances, no revolution in social conditions, can possibly transform the nature of man. Some of the worst men and women in the world, whose names are chronicled by history with a shudder of horror, were those who had all the advantages that wealth, education, and station could confer, or ambition could attain.

"The supreme test of any scheme for benefiting humanity lies in the answer to the question, What does it make of the individual?"

"*Secondly.* The remedy, to be effectual, must change the circumstances of the individual, when they are the cause of his wretched condition and lie beyond his control.

"Favorable circumstances will not change a man's heart or transform his nature, but unpropitious circumstances may render it absolutely impossible for him to escape, no matter how he may desire to extricate himself. The first step with these helpless, sunken creatures is to create the desire to escape, and then provide the means for doing so.

"*Thirdly.* Any remedy worthy of consideration must be on a scale commensurate with the evil with which it proposes to deal. It is no use trying to bail out the ocean with a pint pot. The evil is one whose victims are counted by the million. There must be no more philanthropic tinkering, as if this vast sea of human misery were contained in the limits of a garden pond.

"*Fourthly.* Not only must the scheme be large enough, but it must be permanent. That is to say, it must not be merely a spasmodic effort, coping with the misery of to-day.

"*Fifthly.* But while it must be permanent, it must also be immediately practicable. Any scheme, to be of use, must be capable of being brought into instant operation with beneficial results.

"*Sixthly.* The indirect features of the scheme must not be such as to produce injury to the persons whom we seek to benefit. It is no use conferring sixpenny-worth of benefit on a man if, at the same time, we do him a shilling's worth of harm.

"*Seventhly.* While assisting one class of the community, it must not seriously interfere with the interests of another. In raising one section of the fallen, we must not thereby endanger the safety of those who with difficulty are keeping on their feet.

"It is no use saying we could build a bridge across the Tay if the wind did not blow, or that we could build a railway across a bog if the quagmire would afford us a solid foundation. The engineer has to take into account the difficulties, and make them his starting point. The wind will blow, therefore the bridge must be made strong enough to resist it. Chat Moss will shake, therefore we must construct a foundation in the very bowels of the bog on which to build our railway. So it is with the social difficulties which confront us. If we act in harmony with these laws we shall triumph; but if we ignore them they will overwhelm us with destruction and cover us with disgrace."

We come thus to the statement of the plan. Says General Booth (p. 90):

"What, then, is my scheme? It is a very simple one, although, in its ramifications and extensions, it embraces the whole world. In this book I profess to do no more than to merely outline, as plainly and as simply as I can, the fundamental features of my proposals. I propose to devote the bulk of this volume to setting forth what can practically be done with one of the most pressing parts of the problem, namely, that relating to those who are out of work, and who, as the result, are more or less destitute. I have many ideas of what might be done with those who are at present cared for in some measure by the State, but I will leave these ideas for the present. . . .

The Plan.

"The scheme I have to offer consists in the formation of these people into self-helping and self-sustaining communities, each being a kind of cooperative society, or patriarchal family, governed and disciplined on the principles which have already proved so effective in the Salvation Army.

"These communities we will call, for want of a better term, colonies. There will be:

"(1) The city colony.

"(2) The farm colony.

"(3) The over-sea colony.

"By the city colony is meant the establishment, in the very center of the ocean of misery of which we have been speaking, of a number of institutions to act as harbors of refuge for all and any who have been shipwrecked in life, character, or circumstances. These harbors will gather up the poor destitute creatures, supply their immediate pressing necessities, furnish temporary employment, inspire them with hope for the future, and commence at once a course of regeneration by moral and religious influences.

"From these institutions, which are hereafter described, numbers would, after a short time, be floated off to permanent employment, or sent home to friends happy to receive them on hearing of their reformation. All who remain on our hands would, by varied means, be tested as to their sincerity, industry, and honesty, and as soon as satisfaction was created, be passed on to the colony of the second class.

"This would consist of a settlement of the colonists on an estate in the provinces, in the culture of which they would find employment and obtain support. As the race from the country to the city has been the cause of much of the distress we have to battle with, we propose to find a substantial part of our remedy by transferring these same people back to the country; that is, back again to 'the garden!'

"Here the process of reformation of character would be carried forward by the same industrial, moral, and religious methods as have already been commenced in the city, especially including those forms of labor and that knowledge of agriculture which, should the colonist not obtain employment in this country, will qualify him for pursuing his fortunes under more favorable circumstances in some other land.

"From the farm, as from the city, there can be no question that large numbers, resuscitated in health and character, would be restored to friends up and down the country. Some would find employment in their own callings, others would settle in cottages on a small piece of land that we should provide, or on cooperative farms which we intend to promote; while the great bulk, after trial and training, would be passed on to the foreign settlement, which would constitute our third class, namely the over-sea colony. . . .

"The scheme, in its entirety, may aptly be compared to a great machine, founded in the lowest slums and purlieus of our great towns and cities, drawing up into its embrace the depraved and destitute of all classes; receiving thieves, harlots, paupers, drunkards, prodigals, all alike, on the simple conditions of their being willing to work and to conform to discipline. Drawing up these poor outcasts, reforming them, and creating in them habits of industry, honesty, and truth; teaching them methods by which alike the bread that perishes and that which endures to everlasting life can be won. Forwarding them from the city to the country, and there continuing the process of regeneration, and then pouring them forth on to the virgin soils that await their coming in other lands; keeping hold of them with a strong government, and yet making them free men and women; and so laying the foundations, perchance, of another empire to swell to vast proportions in later times. Why not?"

General Booth, on condition of the public furnishing him £1,000,000, or £100,000 in cash and £30,000 yearly, being the interest on £1,000,000 at 3 per cent., bound himself and the Salvation Army to demonstrate the entire practicability of the scheme. He soon received the £100,000 required. The account of the first year's work of the scheme, issued by the Salvation Army, shows for London the following: For men—8 shelters, 7 food depots, 3 poor man's Metropoles (superior lodging-houses), 1 labor bureau, 6 workshops and labor factories. For women—8 rescue homes, 1 help and inquiry department, 8 registries, 1 shelter and food depot, 1 lodging-house, 1 bookbinding factory, 1 knitting factory, 1 laundry, and 21 slum officers' posts.

In the year 1889-90 the trading operations of the army were carried on with the net profit for the year of £12,800, of which £10,365 was paid over to the general funds of the army.

All sorts of the most suffering and degraded took advantage of the food depots; the farthing meals were especially beneficial to the children. The rescue homes recorded 1300 girls.

The scheme has steadily progressed. By 1892 there was a National Labor Exchange at Queen Victoria Street, with 10 branches. In 1892, 10,743 registered. Only 421 were found permanent situations, but 3010 were given temporary work in the elevators or workshops, and a considerable number were found temporary outside work. In 1895 employment was found for 19,372 persons.

The furniture and certain other articles produced are partly used by other departments of the Salvation Army. Other products are sold in the open market.

A farm colony was opened May 1, 1891, on the Thames, 37 miles from London, consisting of 3 farms with 1150 acres, of which 800 acres are devoted to the dairy and ordinary farming, while the remaining 300 acres are laid out in extensive fruit and market gardens.

The colony is not intended to furnish a permanent home for the men who pass through it, but was established for the purpose of furnishing a training ground for any workless man who wishes to be trained for service in the colony over the sea (in Australia), irrespective of the class of unemployed to which he belongs. He may have been a deserving man, or he may have been a very undeserving man who now wishes to do well. The colony, subject to certain conditions, is open to all classes and there are all classes upon it. Their behavior is good. Only ten per cent. of the whole have had to be sent away for persistent idleness or drunkenness. There has been no disorder during the whole time the colony has been in existence. There has never been any occasion to call in a policeman to settle any disturbances or disputes, or fights, or anything of the kind. The majority of the men work and are fairly thankful for the efforts that are made on their behalf. They improve in their physique. They become better to look at, and they improve morally. Even those who do not at all accept the religious influences, and who pay very little attention to the religious work car-

ried on (the attendance at which is entirely voluntary), improve.

The principal buildings upon the colony are as follows:

(1) Dormitories, for 350 colonists, consist of seven distinct buildings. (2) Officers' and employees' residences—four houses and 16 cottages. (3) The hospital, capable of accommodating 20 patients, and medically furnished. (4) The Salvation Army barracks, with seating for 600 people. (5) Reading-room, library, etc. (6) Covered yard and cowhouse, covering half an acre of ground. (7) Pig sties. Four pig sties, with accommodation for 500 pigs. (8) Stores. Stone and brick building used as warehouse and store. (9) Bakery, with the usual fittings and accessories. (10) The offices, originally erected as a dairy, adapted and used for the present as offices. (11) The railway running from the landing stage to the foot of the hill, where it communicates with the steam wire elevator. (12) The wharf and landing-stage. Here steam cranes raise the contents of the barges, and put them on the railway trucks. (13) Brickyards. Two valuable beds of clay are being worked. (14) Sorting shed (erecting), where the colonists can work in wet weather. (15) Market garden stores. Brick building, 120 feet by 30 feet.

The development of the over-sea colony has naturally come latest. Some beginnings, however, have been made in India and elsewhere.

General Booth's latest scheme, and one which he considers to be the largest and most important he has ever evolved, is that for the establishment of peasant settlements in India.

We quote from the *Conqueror*, the monthly organ of the Salvationists in the United States, the following outline of the general's plans for India:

"1. There is enough surplus land to support the surplus population for many years to come.

"2. When that is exhausted there will be vast tracts of tropical Africa, Asia, and America which can be colonized from India.

"3. To meet the existing difficulty it is proposed by General Booth to organize at once an Indian Peasant Settlement Scheme.

"4. The operation of the scheme will be fourfold, embracing: (a) Peasant settlements, (b) land agency, (c) village loan agency, and (d) agricultural schools.

"(1) It is proposed to ask the Indian Government and the native States at once for, say, 50,000 acres of land, in suitable blocks of from 500 to 5000 or more acres, free of taxes, for five years. It is calculated that on the 50,000 acres there can be settled (at the rate of five acres per family) 10,000 families (say, 50,000 people, including children); but it is proposed to begin with only half that number, in order to allow for expansion. The capital expenditure required for commencing operations, breaking up land, sinking wells, building houses, buying cattle, and settling first colonists is calculated to be about \$250,000, at \$5 per acre, or \$50 per family. This sum it is proposed to raise: (a) in donations, (b) in loans from private sources, bearing interest at 5 per cent., and repayable within a given term of years; (c) in loans from Government, under what is known as the 'Takkavi,' or agricultural loan law.

"(2) Connected with each colony will be an agency for acquiring waste land in or near the overpopulated towns and villages. This land would be cultivated by the labor of the adjoining villagers, thus saving all preliminary outlay for houses, wells, support of colonists, etc.

"(3) To combat the usurious money-lender, an agency will be established in connection with the farm colonies for making loans on easy terms, acting as (a) the go-between for government in obtaining for the depressed classes loans under the Takkavi law; (b) as the agents for banks, firms, philanthropists, and others, who may be desirous of investing sums of money in this way at a fair rate of interest, and (c) on the cooperative village loan system.

"(4) Agricultural schools for thousands of children will in course of time be established, where, combined with a sufficient education, they will be taught the best forms of agriculture, and ultimately sent out to form settlements and colonies in distant countries and

provinces. Meanwhile, they would be largely, if not entirely, self-supporting; growing their own food, building their own huts, and living at a minimum of expense."

General Booth estimates that, worked on purely native lines, if once the initial outlay is provided, the scheme will not only become self-supporting, but will supply considerable profit for extension, besides vastly increasing the government revenue, by the occupation of land at present uncultivated, and the establishment of a happy and prosperous peasantry.

In carrying out his plans for peasant settlements in India, he will have the support of the Indian Government.

The Salvation Army in the United States has developed no such social work as in London, yet it is commencing and preparing to work on these lines in this and all other countries. The size, and strength, and discipline of its international organization help this. Already the social work in the United States embraces 2 shelters for women and 5 for men, with sleeping accommodation for about 1100; 8 rescue homes for fallen women, accommodating about 200; 1 home for 20 ex-criminals; 2 day-nurseries for infants; and 2 farms, one of 40 and the other of 350 acres.

More than 100 officers are entirely set apart for carrying on these various operations, including 60 slum officers, who live entirely in the slums of our great cities, nursing the sick, visiting the saloons, and exercising a reforming influence over some of the worst neighborhoods.

Arrangements are now being made for the establishment of farm colonies, potato patches (on Mayor Pingree's plan), and the usual shelters, food depots, and homes in connection with most of the principal cities throughout the United States.

According to the last published report, there were, in 1895, 284 institutions in operation as parts of General Booth's scheme, 156 of which are outside of Great Britain. The total number of officers engaged is 1155, of whom 694 labor in the British Isles. The number of slum posts is 82; of rescue homes, 60; of ex-criminals' homes, 12; of food and (or) shelter depots, 68; of labor bureaus, 29; of labor factories, 25, and of farm colonies, 8.

These, of course, are aided in their work of finding employment, reuniting families, etc., by the whole organization of the army, of which the following are the most recent statistics: Corps 3200, outpost 1216, officers 11,588 in 34 countries, weeklies 27 and monthlies 15, circulating 50,000,000 copies, besides 4,000,000 copies of books and pamphlets. The total sum raised annually by the Salvation Army is about \$2,250,000; 2002 officers in 1895 were in the United States. Considerable criticism has been raised against Mr. Booth's scheme. He was accused at one time of having appropriated funds given for his social scheme to further his religious army work, including support for his own family, but after full investigation by a competent committee, this was absolutely disproved.

(See UNEMPLOYED.)

Revised by F. DE L. BOOTH-TUCKER.

SANITATION.—The progress of modern science, particularly of physiology, biology, hygiene, etc., has called increasing attention to the importance not only to the individual, but also to the community, of proper sanitary conditions. Early social sanitary arrangements were of the most primitive type, and down to the present century consisted mainly of systems of quarantines for contagious diseases, unless the provisions of public baths and gymnasia in most ancient cities be included under this head. (See BATHS.) In 1850 the first International Sanitary Convention was held at Paris, and it did much to spread ideas of municipal hygiene in place of useless quarantines. The destruction of sources of infection and the inspection of dwellings was strongly advocated. In the United States various yellow fever and other epidemics called attention to the subject. In 1866, in New York City, a Metropolitan Health Board was established, organized on the lines of the English Sanitary Acts. In 1869 Massachusetts established a State board, and other States and cities rapidly followed. March 3, 1879, Congress created a National Board of Health. To-day municipal hygiene is receiving much attention. It includes the study of (1) The climate, and how to render its vicissitudes less dangerous. (2) Telluric conditions, and how to render the land and air dryer by drainage. (3) The site or location of dwellings, the material of which they are built, their heating, lighting, and ventilation. (4) The arrangements of streets and alleys, their paving, cleansing, and repair. (5) The water supply, its quality and quantity, and the disposal of house-waste and sewage. (6) The food supply, markets, slaughter-houses, bakeries, canned and condensed food factories. (7) The effects of trades, manufactures, and other pursuits or employments. (8) The location, construction, internal arrangements, and condition of tenement-houses and public buildings, including churches, schoolhouses, hospitals, and prisons. (9) The management of contagious and infectious diseases, vaccination, isolation, disinfection, and house-to-house sanitary inspection. (10) Vital statistics, registration of births, marriages, and deaths. (11) Disposal of the dead, inhumation, cremation, coking, embalming, and electro-plating.

In Europe municipal hygiene has been carried to a much further degree than in the United States. (See BERLIN; BIRMINGHAM; GLASGOW; PARIS.) England has expended within a few years over \$600,000,000 on public health, and lowered death rates from 22 per 1000 in 1875 to 17 in 1889. Dr. W. E. Boardman shows, in the sixth report of the Massachusetts board of health, that that State loses \$13,000,000 by preventible diseases.

J. S. Billings, M. D., of the United States Army, in addresses delivered before and published by the American Academy of Political Science in 1891, on *Public Health and Municipal Government*, says that the average shortening of life connected with poverty is from 10 to 15 years. Of Philadelphia he says:

**Sanitary
Science.**

"The annual death rate of Philadelphia ought not to be as great as that of London, which is about 20 per 1000—indeed, I think it is safe to say that with a constant pure water supply, good sewerage, and clean and smooth streets, this rate should not exceed 18 per 1000. During the last five years its death rate has been 22.5 per 1000, which means that there have been each year over 4000 deaths and 7000 constant cases of sickness which were unnecessary.

"Allowing \$25 as the cost of each death for funeral expenses, etc., and \$200 per year as the cost of medicines, medical attendance, food, and nursing for a sick person, we find that about \$1,500,000 were lost to the citizens in this way."

The same authority said in the *Forum* for May, 1893:

"The most important factor in municipal sanitation is the general water supply. For all our large cities this is abundant in quantity, since over half of it goes to waste, through leaky fittings, in trickling drops and tiny streams which do not even serve to cleanse the waste-pipes. The quality is also generally good. Nevertheless, almost every city has present or prospective difficulties in preventing dangerous or offensive pollutions of its supply, and the recent possibilities of an invasion of cholera have drawn attention to the matter almost everywhere.

"With a general water supply comes the necessity for means of prompt removal of the water which has been fouled by use, that is, of sewerage. All of our large cities, with the exception of Baltimore, are provided with sewers, but these are in some cases unsatisfactory, having been badly planned, worse constructed, and too much uncared for; and everywhere there is much work to be done in this respect to meet the needs arising from growth and extension of the municipalities.

"Public wash- and bath-houses are to be found in many European cities, and are of great value in promoting cleanliness of clothing and of the person among the poor. To them poor women can take their bundles of soiled clothing and bedding, and by the payment of a small fee can have the use of tubs, tables, hot and cold water, and drying facilities, and can also have a bath. In the evening, men can also obtain baths there. Some of our cities have waterside swimming-baths for summer use, but public washhouses under municipal management and control are practically unknown in this country. Abattoirs, or public slaughter-houses, where all animals are examined by skilled inspectors before being killed, where the meats can be inspected, and where all the nuisances and dangers connected with private slaughter-houses can be either done away with or reduced to the lowest limits, are to be found in only three or four of our cities.

"In the constant struggle of health officials to prevent the spread of such contagious diseases as diphtheria and scarlet fever there are few things for which they find a more urgent need than hospitals specially calculated and set apart for the reception of this class of cases; yet very few cities are provided with them.

Most of our cities are also in need of one or more public disinfection stations under skilled management; provided with the best modern means of disinfecting bedding, clothing, etc., and also with portable apparatus which can be sent to and used in an infected house. Another important means of aiding to check the spread of contagious disease, as well as of helping the very poor in their struggle to maintain a decent existence in the midst of sore trouble, is a public mortuary—a simple building, in or near the poor quarter, where the bodies of the dead can be taken immediately after death and properly cared for, and where funeral ceremonies can be performed. The desire to preserve the dead mother or the dead child for two or three days, in order to allow time to apprise friends and arrange for the funeral, is no less strong in the poor family than it is in the rich one; but when there are only one or two rooms, and the living must cook, eat, and sleep in the presence of the dead, this natural wish produces unnatural and sometimes dangerous results. All large European cities, and many of the smaller ones, have public mortuaries, and their privileges are highly valued. They are not connected with pauper administration, a small fee is charged for their use, and they are used by transient visitors of the well-to-do classes when occasion comes. They are not morgues, although sometimes one room, with a separate entrance, may be set apart for this purpose. They have a separate room for the care of the bodies of those dying of contagious disease, and

special means of preventing infection therefrom. I do not know of any public mortuary belonging to any city in this country, although it is possible that there may be such."

One of the most important portions of public hygiene is the disposal of the sewage. Science has pointed out a healthy way, but the adoption of it in the United States is very slow. It is simply to collect the excrementitious products (feces and urine) in suitable vessels, and either use them as a fertilizer, or destroy them by cremation. The former plan is much the cheaper and is said to be almost self-supporting. In Japan it is done at a profit to the householder, who is paid for the deposit. The latter is safer on account of the possible propagation of such diseases as cholera and typhoid fever by the "germs" finding their way back into the drinking water of outlying villages or farms where the fertilizer is used. Omitting the pneumatic system of Liernur, which requires water-closets, soil-pipes, and fecal reservoirs, there are two plans which have been approved by sanitarians as satisfactory for securing the fecal deposits for fertilizing purposes: the "pail" system, better known as the "Rochdale"; and the earth or ash-closet system ("commode"), first introduced by Rev. Henry Moule of England.

Some English and German cities make considerable profit for the city by sewage farms, the sale of fertilizers, etc.

(See BERLIN; BIRMINGHAM; GLASGOW.)

SANBORN, FRANKLIN BENJAMIN, was born at Hampton Falls, N. H., in 1831. Graduating at Harvard College, he interested himself in the anti-slavery cause and was secretary of the Massachusetts-Kansas Committee in 1856. He has been a leading member of the Massachusetts State Board of Charities, secretary of the Social Science Association, and of the Concord Summer School of Philosophy. He has written lives of Thoreau and John Brown, besides numerous articles on sociological subjects.

SAUNDERS, WILLIAM, was born at West Lavington, England, in 1823. He entered business as proprietor of stone quarries, but became interested in public questions, and in 1860 founded the *Western Morning News*, and later the Central News Agency. He traveled in the United States, and wrote *Through the Bright Continent*. Always a Radical, he became, by reading *Progress and Poverty*, one of the staunchest supporters in England of the Single Tax, and contributed largely to the spread of this idea, by giving it financial and literary support. He was returned as a Radical for East Hull in 1885, defeated the next year, but returned for Walworth some time in 1892. He died May 1, 1895.

SAVINGS-BANKS.—The first savings-bank is said to have been founded in Brunswick, Germany, in 1765, and to have been followed by several in Germany and Switzerland. In England Jeremy Bentham (*g. v.*) proposed a well-devised system of "frugality banks" in

Savings-Banks.

1217

Savings-Banks.

1797. Various plans followed his for encouraging savings among the poor, but the first savings-bank of the modern type in Great Britain was organized by the Rev. Henry Duncan of Ruthwell, Scotland, in 1810. In 1817 two acts were passed by Parliament, encouraging savings-banks. Since then they have grown rapidly. In 1861, postal savings-banks (*q. v.*) were begun. The savings-banks system of France dates from 1818. The following is an unofficial estimate of the savings-banks statistics of Europe :

COUNTRIES.	Number of Depositors.	Amount of Deposits.
Austria.....	1,850,000	\$613,000,000
Belgium and Netherlands.....	310,000	82,000,000
France.....	4,150,000	559,000,000
Germany.....	5,000,000
Great Britain.....	3,715,000	535,000,000
Italy.....	1,970,000	345,000,000
Switzerland.....	1,600,000	118,500,000

In the United States the first savings-bank was organized in 1816, in New York City, tho a savings-bank seems to have been actually opened in Philadelphia before the New York bank was really under way. The first incorporated savings-bank was opened in Boston the same year. The following statistics for the United States are compiled from the report of the Comptroller of the Currency for 1895 :

STATES AND TERRITORIES.	Number of Depositors.	Amount of Deposits.
Maine.....	155,704	\$54,531,223
New Hampshire.....	163,702	26,745,703
Vermont.....	94,994	26,433,697
Massachusetts.....	1,247,090	416,778,018
Rhode Island.....	131,623	67,444,117
Connecticut.....	337,254	136,628,858
New York.....	1,615,173	643,873,574
New Jersey.....	144,160	36,149,920
Pennsylvania.....	264,642	68,522,217
Delaware.....	18,648	3,765,784
Maryland.....	148,342	45,499,279
District of Columbia.....	1,359	95,300
West Virginia *.....
North Carolina.....	169,039	291,744
South Carolina.....	174,118	4,578,838
Georgia.....	5,747	745,596

1890.....	921	4,258,893	1,524,844,406
1801.....	1,011	4,533,217	1,623,079,749
1892.....	1,059	4,781,605	1,712,769,026
1893.....	1,039	4,830,599	1,785,159,957
1894.....	1,024	4,777,687	1,747,961,280
1895.....	1,017	4,875,519	1,810,597,023

The investments of savings-banks of the United States in 1892-93 was: Real estate loans, \$763,000,000; loans on other securities, \$283,000,000; United States bonds, \$129,000,000; State stocks and bonds, \$503,000,000; railway securities, \$121,000,000; bank-stock, \$44,000,000; real estate, \$34,000,000.

In studying savings-banks statistics, however, great care must be exercised before accepting them as evidences of prosperity among the working classes. The *Outlook* for September 7, 1895 :

"In the last number of the *Yale Review* Professor Farnam follows the same line of argument as did Secretary Carlisle in his Memphis speech, and attempts to show that the public is mistaken in supposing that the interests of the creditor class are the interests of the comparatively rich. In his argument he lends the weight of his authority to Secretary Carlisle's savings-bank statistics. He says :

"The total deposits in 1890 were \$1,524,844,506, distributed among 4,258,893 persons, making an average of \$358.03 for each depositor. The savings-bank deposits alone represent more than half as much again as the farmers' debt, owned by five times as many persons."

"If it is true that there are over 4,000,000 savings-bank depositors among our 12,000,000 families, then it is true that a large portion of our small property owners belong to the creditor class. But the fallacy in this has been repeatedly exposed in official reports. The official reports are for deposits and not depositors. Three millions and a half of the deposits are in New York and New England, where there are only 2,000,000 families altogether, and not to exceed 1,000,000 depositors. But this is not all. The working-class depositors nowhere furnish the bulk of the deposits. The large depositors and the multiple depositors belong to an entirely different class. In Massachusetts, where $\frac{1}{2}$ of the deposits are made in sums less than \$100 (and presumably belong to the working classes), the aggregate of these is only $\frac{1}{4}$ of the total amount deposited. These conclusions from the Massachusetts investigations are strikingly confirmed by the present investigation in Baltimore. In Baltimore, also, there are more savings-bank deposits than families, yet in Baltimore only one family in three possesses personal capital of any description, while the aggregate holdings of $\frac{2}{3}$ of these is but 6 per cent. of the total."

This subject was most fully investigated in Massachusetts as early as 1872; by the Massachusetts Bureau of the Statistics of Labor in 1872, 1873 and 1874.

On returns from 39 banks the report for 1872 (p. 316) found that $\frac{1}{10}$ of the deposits was nearly $\frac{1}{2}$ of the amount in those banks, the remaining $\frac{9}{10}$ depositing only a little over $\frac{1}{3}$. The $\frac{1}{10}$ of the deposits were those of \$300 or over, and it was the argument of the report that since, except in the rarest instances, and under the most exceptional circumstances, no ordinary wage-worker could possibly save more than \$300 a year from his earnings (see WAGES), the amount deposited by that $\frac{1}{10}$, or nearly $\frac{1}{2}$ of the total amount,

could not have been deposited by wage-workers. This conclusion was supported by abundant quotations from various reports of the Bank Commissioners of the State, who say, in 1870: 'These institutions are becoming still more the favorite place of deposit, not only for persons of small means, but also for those seeking investment for very considerable amounts.' Governor Claflin is quoted as saying in his message for 1871: 'It is very evident that a large share of this increase is not the savings of labor. Each year shows more deposits by capitalists.' Repeated instances were found of men having in each of many banks deposits to the limit of the law. Still more instances were found of one man or woman having deposits under several accounts, as for himself, or herself, and as trustees for children, etc., indicating again depositors not of the wage-working class. One man was reported to have a deposit in each bank of the State; another will deposit for each member of his family, and a part of the alphabet. From this, and other similar evidences, the report concluded (p. 332): 'It is evident from these returns that the great bulk of depositors is from the wage classes, and it is equally evident that the great sums, generally credited to them, are not the savings of wage labor, but are the results of profits upon labor in some form.'

This report made somewhat of a sensation in Boston and in Washington. From the report of 1873 we learn that in Congress, during a discussion of the tariff, certain Western Congressmen, opposed to protection, made use of the report before it had been officially presented to the legislature of Massachusetts, to show that Massachusetts wage-workers were not as well off as was claimed by the protectionists. This incensed some Massachusetts capitalists, and the Committee on Banks and Banking of the Massachusetts legislature, the majority of the committee being connected with savings-banks, undertook to disprove the offensive report. A hearing was called. The Bureau of Labor was invited to come before it 'in order that it might make suggestions'; but, when the hearing took place, the bureau found itself, with little or no warning, confronted with a hired counsel who called witnesses from 11 banks to disprove the bureau's report, based on 39 banks, the counsel arguing that the bureau's report was untrue, because it was based on reports from only 39 banks.

The bureau ably defended its report, and demanded that if the committee questioned its conclusions, it was only fair, before they condemned it, to have a fuller examination, and not condemn, on picked evidence from 11 banks, a report carefully based on returns from 39 banks. The committee, however, would not hear, and voted the report a mere 'matter of inference,' and not reliable. The personnel of the bureau, too, was changed that year. Mr. H. K. Oliver (chief) and G. E. McNeill (*q. v.*), who had formed the bureau publishing the offensive report, were displaced, and Messrs. Carroll D. Wright and Geo. H. Long were put in their places. Before Mr. Oliver and Mr. McNeill, however, were displaced, they obtained evidence from 91 banks and from the bank commissioners' reports of 1868, 1869, 1870, and 1871, abundantly sustaining their position. From 91 banks they found and stated (p. 107) that $\frac{1}{3}$ of the deposits were of \$300 or under, *i. e.*, might possibly be deposits of working men, but that these $\frac{1}{3}$ of the deposits represented only $\frac{1}{11}$ of the amount deposited. From the Bank Commissioners' reports they found and stated (p. 227) that in 1868 and 1869, $\frac{1}{4}$ of the whole number of deposits amounted to $\frac{1}{2}$ of the whole amount deposited; that in 1870, $\frac{1}{4}$ amounted to $\frac{1}{3}$ of the whole amount, and that in 1871, $\frac{1}{4}$ of the deposits amounted to nearly $\frac{1}{2}$ of the total amount, thus not only abundantly supporting the former report of the bureau, but showing that the proportion of large depositors in the savings-banks was on the increase.

The next year, 1874, Messrs. Wright and Long sign the report. The subject of savings-banks is naturally handled very lightly, but even according to their table (pp. 244-245) we learn that over $\frac{1}{2}$ of the deposits were deposits of \$300 or over, showing that the number of large depositors was even greater than the former reports had claimed, and that these large deposits amounted to nearly $\frac{2}{3}$ of the whole amount. Five-sixths of the deposits equalled not much over $\frac{1}{2}$ of the whole sum; an abundant proof that the large amount of money in Massachusetts savings-banks cannot be taken to prove the prosperity of the Massachusetts working people.

(See also POSTAL SAVINGS-BANKS, and SCHOOL SAVINGS-BANKS.)

SAY, JEAN BAPTISTE, was born in Lyons, France, in 1767. Educated for a commercial career, he spent a part of his youth in England. Returning to Paris, he worked on Mirabeau's paper, *Courrier de Provence*. Later he was secretary to Clavière, Minister of Finance. From 1794 to 1800, he edited *La Décade*. He was a member of the Tribunate of 1799. He published his best known work, *Traité d'Économie Politique*, in 1803; his *Catéchisme d'Économie Politique* in 1815, and his *De l'Angleterre et des Anglais* in 1816. His dissent from Napoleon's policy drove him into private life, and he established a spinning mill, but after Napoleon's fall he was made professor at the École des Arts et Métiers in 1819, and at the Collège de France in 1831. He died in Paris in 1832. Cossa considers him among the first of the continental writers to have appreciated and popularized Adam Smith (*q. v.*).

SAY, JEAN BAPTISTE LEON, grandson of Jean Baptiste Say, was born in Paris in 1826. He devoted himself to political economy, and for many years was contributor to the *Journal des Débats*. He was returned to the National Assembly in 1871, and became prefect of the Seine the same year. He was Minister of Finance in 1873-75-77, and 1882. In 1880 he was appointed ambassador to London, but returned in a few weeks, having been elected president of the Senate. Among his works are: *Les Solutions Démocratiques de la Question des Impôts* (1886); *Le Socialisme d'État* (1890). He edited *Le Dictionnaire des Finances* (1889); and conjointly with Jos. Chailley, *Le Dictionnaire d'Économie Politique*.

SCHÄFFLE, ALBERT EBERHARD FRIEDRICH, was born at Nürtengen, Württemberg, in 1831. He studied theology at Tübingen, but became professor of Political Economy there in 1861. He sat in the Württemberg Landtag from 1862 to 1865, and for a short time in 1871 was Minister of Commerce for Austria. On the fall of the ministry he went to Stuttgart and devoted himself to economics. His chief works are: *Die Nationalökonomie* (1861), 3d ed. published under the title *Das gesellschaftliche System der menschlichen Wirtschaft* (1873); *Kapitalismus und Sozialismus* (1870); *Quintessenz des Sozialismus* (1874), and *Die Aussichtslosigkeit der Sozialdemokratie* (1885). His *Quintessence of Socialism* (its English name), translated in 1889, is considered by many one of the ablest presentations of socialism, and is considered by some to show Schäffle a socialist, which Cossa thinks is scarcely disproved by his latter work *The Impossibility of Social Democracy* (Eng. tr.). In his *Bau und Leben des sozialen Körpers* (1875-78, new ed. 1881), Schäffle, under the influence of Comte and Spencer, outlines a comprehensive plan of an analysis of the social body.

SCHMOLLER, GUSTAVE, was born at Heilbronn in 1834, and successively professor at Halle, Strasburg, and Berlin. He is per-

haps the leading German Socialist of the Chair (*q. v.*), having opened the famous congress at Eisenach in 1872. Since 1881 he was editor of the important *Jahrbuch für Gesetzgebung Verwaltung und Volkswirtschaft*. He is best known as one of the leaders of the Historical School (*q. v.*). He began with an essay on economic ideas in the time of the German Reformation, 1860; he then approached the modern industrial question in his excellent book, *Zur Geschichte der deutschen Kleingewerbe im neunzehnten Jahrhundert* (History of the Smaller Industries of Germany in the Nineteenth Century, 1870); but he soon changed his line of study, centering his efforts upon a history of the Prussian administration. Portions of this history have appeared as a series of articles contributed to the *Preussische Jahrbücher*, to the *Zeitschrift für preussische Geschichte*, and recently to his own *Jahrbuch*. Besides these works he has published, as a result of a study of the Middle Ages, *Die Strassburger Tucher- und Weberzunft, ein Beitrag zur Geschichte der deutschen Weberei und des deutschen Gewerberechts vom XIII. bis XVII. Jahrhundert* (The Weavers' and Cloth Makers' Guild of Strasburg; a Contribution to the History of the German Weaving Industry and German Industrial Law, from the Thirteenth to the Seventeenth Centuries). This work, consisting of documents and explanations, together with a glossary and index, appeared in 1879. Furthermore, in close connection with these studies, Schmoller has edited a collection of historical investigations by other writers in the *Staats- und sozialwissenschaftliche Forschungen* (Investigations in Political and Social Science), of which four volumes have been issued since 1879.

SCHOOLS. See EDUCATION.

SCHOOL SAVINGS-BANKS are in wide use in Europe, and are acknowledged and proven to be one of the best practical educational factors. They train the population to habits of thrift and self-dependence, and reduce crime, intemperance, and pauperism.

In France there are 23,375 school savings-banks under patronage of the government; in Belgium, 5259; in Germany, Hungary, Russia, Switzerland, England, and the Netherlands, they are in common use. The statistics of postal saving-banks (*q. v.*) and school savings-banks are officially reported together, in several divisions of Europe.

In 1855 Professor Thiry, a French educator, in America for his health, as a school commissioner in Long Island City, introduced the system into the public schools there. Since this date the system has spread widely, and by 1893 325 schools had such savings-banks, and \$350,634.32 had been deposited.

The proportion of depositors in the public schools where the system is in use numbers about two-fifths of the pupils in attendance. Of 90,070 on the school registers, where school saving-banks are in use, 36,810 are depositors. As the proportion of depositors increases the benefits of the work widen. It is not how

much any one pupil deposits or how much interest he gets for his money, but how many have accounts and how thoroughly the principles of thrift, economy, and business forethought are taught that is of the greatest value.

(See POSTAL SAVINGS-BANKS.)

SCHULZE-DELITZSCH, HERMANN, was born in 1808 at Delitzsch, Saxony. Educated at Leipsic and at Halle, he was made judge at Naumbourg and then Berlin, and in 1841 entered the royal magistracy. Spending his vacations in travel, he became deeply interested in the working classes. After the revolution of 1848, he was elected deputy by the electors of Delitzsch, and took his seat on the left center with Rodbertus. But seeing the victory of a reactionary opposition, he retired to Delitzsch and there commenced the movement to establish the cooperative agricultural banks with which his name is connected. (See COOPERATIVE BANKS.) He became the leader of the individualist policy of cooperation without state aid, and so when Lassalle commenced his socialist propaganda, Schulze-Delitzsch was invited by the working men of Leipsic to champion his ideas against Lassalle, but declined, and the majority of the working men turned to Lassalle. (See GERMANY AND SOCIAL REFORM.) His cooperative movement however went on, and on his death, in 1885, had reached large proportions.

SCOTLAND AND SOCIAL REFORM.—

Scotland was first known to the world as the home of the Picts. Never permanently conquered by any foreign race, the Romans could do no more than build a wall from the Solway to the Tyne, and later, one from the Forth to the Clyde, to protect England from Pict invasions. Edinburgh, it seems, however, was founded by a Saxon king in 449, while the Irish Scots (Celts) founded a Scottish kingdom on the western shore, bringing Christianity with them. In 843 Kenneth became king of both the Scots and the Picts, and so united them into one kingdom known later as Scotland. In 945 the King of England bestowed on Malcolm I. a portion of the Cambrian kingdom, and so established a claim for homage which led to the interminable wars between England and Scotland which lasted till union with England was formally ratified by the parliament of Scotland, January 16, 1707. This long period was marked by the gradual wane of the Celtic civilization in Scotland, first, before the Norsemen who long ruled the Hebrides and other islands and made more or less permanent settlements on the mainland, and secondly, before the Normans after their conquest of England. King David, 1124-53, introduced the feudal civilization into Scotland, followed by the gallant struggles of Wallace and Bruce. The former fell at last into the hands of the English; Bruce invaded England 12 times in 14 years, and routed the English at Bannockburn (1314), though at Neville's Cross (1346) the Scotch kings were defeated and compelled to do homage to England.

History.

With Robert II. (1371), the House of Stuart

ascended the throne of Scotland. Seven of this dynasty, however, ascended the throne as minors, giving the nobility a great chance to develop power, and driving the kings to seek aid from the debased Roman Catholic Church of Scotland, while the nobles eagerly embraced the Reformation. The scale was turned by the middle class, led by Knox, who passionately declared for Protestantism, so that when the Stuarts turned to France, and France sought to use Scotland for her ends, the people were largely opposed. When Mary Queen of Scots was betrothed to the Prince of Wales, the son of Henry VIII., statesmen on both sides hoped that the wars of England and Scotland would cease. This betrothal was broken off, but on the death of Elizabeth, her cousin King James of Scotland became James I. of England and union was accomplished.

In 1891 Scotland had a population of 4,025,647, tho only 2,888,742 in 1851, in spite of a large emigration, partly forced, when thousands of homes, particularly among the Highlands, were destroyed to make sheep walks or deer forests, which latter alone covered 4040 square miles in 1891. (See LAND.)

Statistics. The old Highland Gaelic is dying out and the English spreading from the low lands, where is the dense population; 12.3 per cent. of

the people are engaged in agriculture, 1.7 per cent. in fishing, 12.2 in mining and metallurgy, 11.8 in textile industries, 3.3 per cent. in commerce, 6.9 per cent. in transportation, 6.2 in the professions, 11.4 per cent. in personal service as servants, innkeepers, etc., 34.2 per cent. in all other industries. Of the total area only 18.3 per cent. is under the plow; 47.7 per cent. is for grazing. The mining is mainly iron and coal. In manufacturing, the textile industry in 1891 employed 206,550 persons, with 2,413,735 spindles. The making of machinery employed 51,426 men, and ship-building 23,518 workmen. Scotland, since 1560, has had an established church on the Presbyterian system, but, in 1843, a secession led to the Free Kirk. In education, Scotland is in advance of England. (For details of religion and education, see GREAT BRITAIN.) Scotland sends 72 members to the House of Commons, and 16 representative peers out of a peerage of 87, of whom 48 are also peers of the United Kingdom. Local government has been organized since 1889, with county councils as in England. (For other details see AGRICULTURE; CRIME; EDUCATION; RAILWAYS; GLASGOW.)

SOCIAL REFORM.

Modern Social Reform in Scotland may be said to have commenced in 1800, with the experiments of Robert Owen at New Lanark, and, the general interest aroused (see OWEN), Scotland contributed her part to the whole Owenite agitation, to chartism, and to early cooperation and trade-unionism. (See ENGLAND AND SOCIAL REFORM; COOPERATION; AND TRADE-UNIONS.) As the land of Adam Smith and other prominent economists of that school (see POLITICAL ECONOMY), Scotch economic thought has contributed more to individualism than to socialism, yet Chalmers (*q. v.*), with his experi-

ments at Glasgow, MacCulloch, James Mill, Bentham, and all their school, must not be omitted in a notice of Scotch social reforms, for individualism was once as radical and as necessary a social reform as socialism can be to-day. But the memories of Owen were cherished among the trade-unionists and cooperators, and later, Ruskin and Carlyle found many readers in Scotland. Still later, the agitation over the condition of Ireland had its effect on Scotland, and soon depression brought social questions home, and the government had to consider how to relieve the destitute. Under these conditions modern socialism found a beginning in Scotland. Robert Banner in Edinburgh was one of the first to agitate for socialism. A socialist society was early started in the university, and through its influence prominent English reformers like Morris and Hyndman came and lectured, and spread their views. A Land and Labor League was formed in 1884, and affiliated with the Social Democratic Federation, and later with the London Socialist League. In Glasgow a Christian Socialist society was formed. A split from the Edinburgh League realigned itself with the English Democratic Federation, became more enduring than the joint society affiliated with the League, and has led to the formation of socialist branches in all the larger Scotch cities. In 1890 Kier Hardie founded the Scotch Labor Party, and later, the Independent Labor Party, and from this time on Scotch social reform movements can scarcely be distinguished from those of England (*q. v.*). (See also SOCIALISM; TRADE-UNIONS; COOPERATION, etc.) In Glasgow J. Bruce Glazier has become a leader of socialistic reform with his wife, Katharine St. John Conway. In Edinburgh the Rev. John Glasse has been perhaps the most prominent pioneer of socialism.

SELIGMAN, EDWIN ROBERT ANDERSON, was born in New York City in 1861. He was educated at Columbia College, graduating in 1879. He studied political science for three years in Europe in the universities of Berlin, Heidelberg, and Geneva. Returning to this country, he took his degree of A. M. in 1883, and of LL. B. and Ph. D. in 1884. He was appointed lecturer in political economy at Columbia University in 1885; adjunct professor of political economy in 1888; professor of political economy and finance in 1891. He has been one of the editors of the *Political Science Quarterly* since its establishment in 1886. His writings have been mainly monographs on economic subjects, among others the following: *Owen and the Christian Socialists* (1886); *Railway Tariffs and the Interstate Commerce Law* (1887); *Two Chapters on the Medieval Gilds of England* (1887); *Finance Statistics of the American Commonwealths* (1889); *The Taxation of Corporations* (1890); *The Single Tax, Essay and Debate with Henry George*, *Proceedings of American Social Science Association* (1890); *On the Shifting and Incidence of Taxation* (1892); *The Theory of Progressive Taxation* (1893); *Progressive Taxation in Theory and Practise* (1894).

SENATE (UNITED STATES).—The Senate of the United States is a creation of the Constitution which has been lauded by some as one of its most successful provisions and denounced by others as one of its most undemocratic features. It seems, however, to have been rather an accident than a deliberate creation for good or for evil. When some States demanded that each State, large or small, be equally represented in Congress, and other States equally strenuously demanded that representation be proportional to the population of the States, a compromise was effected, by making the representation in the House proportional to population and creating a Senate where each State should have equal representation.

The aims with which the Senate was created, the purposes it was to fulfil, are set forth, under the form of answers to objections, in five letters (lxi.-lxv.), all by Alexander Hamilton, in the *Federalist*. These aims were as follows :

"To conciliate the spirit of independence in the several States, by giving each, however small, equal representation with every other, however large, in one branch of the national government.

"To create a council qualified, by its moderate size and the experience of its members, to advise and check the President in the exercise of his powers of appointing to office and concluding treaties.

"To restrain the impetuosity and fickleness of the popular House, and so guard against the effects of gusts of passion or sudden changes of opinion in the people.

"To provide a body of men whose greater experience, longer term of membership, and comparative independence of popular election, would make them an element of stability in the government of the nation; enabling it to maintain its character in the eyes of foreign States, and to preserve a continuity of policy at home and abroad.

"To establish a court proper for the trial of impeachments, a remedy deemed necessary to prevent abuse of power by the executive."

The especial Constitutional provisions in the Senate are as follows :

(For provisions which apply both to the Senate and the House, see CONGRESS.)

"SEC. III. The Senate of the United States shall be composed of two senators from each State, chosen by the legislature thereof, for six years; and each senator shall have one vote.

Immediately after they shall be assembled in consequence of the first election, they shall be divided as equally as may be into three classes. The seats of the senators of the first class shall be vacated at the expiration of the second year, and of the second class at the expiration of the fourth year, and of the third class at the expiration of the sixth year, so that one-third may be chosen every second year; and if vacancies happen by resignation, or otherwise, during the recess of the legislature of any State, the executive thereof may make temporary appointments until the next meeting of the legislature, which shall then fill such vacancies.

"No person shall be a senator who shall not have attained to the age of 30 years, and been nine years a citizen of the United States, and who shall not, when elected, be an inhabitant of that State for which he shall be chosen.

"Vice-President of the United States shall be President of the Senate, but shall have no vote, unless they be equally divided.

"The Senate shall choose their other officers, and also a President *pro tempore*, in the absence of the Vice-President, or when he shall exercise the office of President of the United States.

"The Senate shall have the sole power to try all impeachments. When sitting for that purpose, they shall be on oath or affirmation. When the President of the United States is tried, the chief justice shall preside; and no person shall be convicted without the concurrence of two-thirds of the members present.

"Judgment in cases of impeachment shall not extend further than to removal from office and disqualification to hold and enjoy any office of honor, trust, or profit under the United States; but the party convicted shall nevertheless be liable and subject to indictment, trial, judgment, and punishment, according to law.

"SEC. IV. The times, places, and manner of holding elections for senators and representatives shall be prescribed in each State by the legislature thereof; but the Congress may at any time by law make or alter such regulations, except as to the place of choosing senators.

"By an Act of Congress passed July 25, 1866, it is provided that when the legislature of any State is to elect a senator in Congress, it shall proceed to the election of such senator on the second Tuesday after the organization of the legislature, and the election shall be conducted as follows :

"Each House shall, by a *viva voce* vote, name a person for senator, and the name of the person who receives a majority vote shall be entered in the journal of the House. If the House fails to give such a majority to any person, that fact shall be entered on the journal. On the next day at 12 o'clock the members of the two Houses shall convene in joint assembly, and the journal of each House shall be read, and if the same person has received a majority of all the votes in each House, he shall be declared duly elected senator. If no one has such a majority, the joint assembly shall choose, by a *viva voce* vote of each member present, a person for senator. The person having a majority of all the votes of the joint assembly shall be declared elected. If there is no election that day, the joint assembly shall meet at 12 o'clock on each succeeding day, and shall take at least one vote each day until a senator is elected."

The officers of the Senate are : (1) a secretary, (2) chief clerk, (3) executive clerk, (4) sergeant-at-arms, (5) doorkeeper, (6) chaplain.

The Senate is a permanent body, while the House of Representatives is changed every two years. As the Constitution went into operation on the 4th of March, 1789, the term of office of every senator, as well as representative, ends on the 3d of March of a year denoted by an odd number. A Congress is measured by the term of office of the representatives; the first extending from the 4th of March, 1789, to the 3d of March, 1791.

When a vacancy is temporarily filled by executive appointment, the senator thus appointed holds his office till the close of the next succeeding term of his State legislature.

The functions of the Senate are threefold : legislative, executive, and judicial. Its legislative function is to pass, along with the House of Representatives, bills which become Acts of Congress on the assent of the President, or even without his consent, if passed a second time by a two-thirds majority of each House, after he has returned them for reconsideration. All bills for raising revenue, however, must originate in the House (*q. v.*). Its executive functions are : To approve or disapprove the President's nominations of Federal officers, including judges, ministers of State, and ambassadors; and to approve, by a majority of two-thirds of those present, of treaties made by the President. Its judicial function is to sit as a court for the trial of impeachments preferred by the House of Representatives.

The comparative smallness of the Senate allows it to act with fewer rules of procedure and more freedom of debate. "Senatorial courtesy" has become a tradition, sometimes used to block legislation. In considering the working of the Senate, we find a favorable, a medium, and an unfavorable view. Of its

favorable features Mr. Bryce says (*American Commonwealth*, 1 ed. pt. i. chap. xii.):

"The Senate has succeeded in making itself eminent and respected. It has drawn the best talent of the nation, so far as that talent flows to politics, into its body, has established an intellectual supremacy, has furnished a vantage ground from which men of ability may speak with authority to their fellow-citizens. . . .

"The Senate, albeit not chosen by direct popular election, does represent the people; and what it may lose through not standing in immediate contact with the masses, it gains in representing such ancient and powerful commonwealths as the States. A senator from New York or Pennsylvania speaks for, and is responsible to, millions of men.

"A small body educates its members better than a large one, because each member has more to do, sooner masters the business not only of his committee but of the whole body, feels a livelier sense of the significance of his own action in bringing about collective action. There is less disposition to abuse the freedom of debate. Party spirit may be as intense as in great assemblies, yet it is mitigated by the disposition to keep on friendly terms with those whom, however much you may dislike them, you have constantly to meet, and by the feeling of a common interest in sustaining the authority of the body. A senator soon gets to know each of his colleagues—they were originally only 25—and what each of them thinks of him; he becomes sensitive to their opinion; he is less inclined to pose before them, however he may pose before the public. Thus the Senate formed, in its childhood, better habits in discussing and transacting its business than could have been looked for in a large assembly; and these habits its maturer age retains. Its comparative permanence has also worked for good. Six years, which seem a short term in Europe, are in America a long term when compared with the two years for which the House of Representatives and the assemblies of nearly all the States are elected; long also when compared with the swiftness of change in American politics. A senator has the opportunity of thoroughly learning his work and of proving that he has learned it.

"A senator has more power than a member of the House, more dignity, a longer term of service, a more independent position. Hence, every Federal politician aims at a senatorship, and looks on the place of representative as a stepping-stone to what is in this sense an Upper House, that it is the House to which representatives seek to mount. It is no more surprising that the average capacity of the Senate should surpass that of the House than that the average cabinet minister of Europe should be abler than the average member of the legislature. . . .

"What is more, the Senate so trains its members as to improve their political efficiency. Several years of service in a small body, with important and delicate executive work, are worth twice as many years of jostling in the crowd of representatives at the other end of the Capitol. If the Senate does not find the man who enters it already superior to the average of Federal politicians, it makes him superior. But natural selection, as has been said, usually seats upon its benches the best ability of the country that has flowed into political life, and would do so no less were the election, in form, a direct one by the people at the polls."

Nevertheless, even Mr. Bryce finds a less favorable view:

"European writers on America have been too much inclined to idealize the Senate. Admiring its structure and function, they have assumed that the actors must be worthy of their parts. They have been encouraged in this tendency by the language of many Americans. As the Romans were never tired of repeating that the ambassador of Pyrrhus had called the Roman Senate an assembly of kings, so Americans of refinement, who are ashamed of the turbulent House of Representatives, are wont to talk of the Senate as a sort of Olympian dwelling-place of statesmen and sages. It is nothing of the kind. It is a company of shrewd and vigorous men who have fought their way to the front by the ordinary methods of American politics, and on many of whom the battle has left its stains. There are abundant opportunities for intrigue in the Senate, because its most important business is done in the secrecy of committee rooms or of executive session; and many senators are intriguers. There are opportunities for misusing senatorial

powers. Scandals have sometimes arisen from the practise of employing as counsel before the Supreme Court senators whose influence has contributed to the appointment or confirmation of the judges. There are opportunities for corruption and blackmailing, of which unscrupulous men are well known to take advantage."

Woodrow Wilson says of the Senate (*Congressional Government*, pp. 194-195):

"The Senate is just what the mode of its election and the conditions of public life in this country make it. Its members are chosen from the ranks of active politicians, in accordance with a law of natural selection to which the State legislatures are commonly obedient; and it is probable that it contains, consequently, the best men that our system calls into politics. If these best men are not good, it is because our system of government fails to attract better men by its prizes, not because the country affords or could afford no finer material. The Senate is in fact, of course, nothing more than a part, tho a considerable part, of the public service; and if the general conditions of that service be such as to starve statesmen and foster demagogues, the Senate itself will be full of the latter kind, simply because there are no others available. There cannot be a separate breed of public men reared specially for the Senate. It must be recruited from the lower branches of the representative system, of which it is only the topmost part. No stream can be purer than its sources. The Senate can have in it no better men than the best men of the House of Representatives; and if the House of Representatives attracts to itself only inferior talent, the Senate must put up with the same sort. Thus the Senate, tho it may not be as good as could be wished, is as good as it can be under the circumstances. It contains the most perfect product of our politics, whatever that product may be."

Many, however, take a much more unfavorable view. They call it the Millionaires' Club, and argue that the senators should be elected by a direct vote of the people, while others believe that the Senate itself should be abolished. Mr. Dorman B. Eaton says of the Senate:

"It is by no means easy to comprehend the breadth and importance of the vast sphere of official life which thus stands eclipsed in the dark shadow of senatorial secrecy and usurpation. . . . Probably one-half of the time of senators given to speaking and voting is given to the matter of filling offices. On an average there must be from three to four nominations to be acted upon by the Senate every day of its session. Now, all the votes, all the speeches, and all the various and important actions connected with these sessions are never reported, or seen, or known by any one but senators and their subordinates. They are never understood by the people. Yet no action of the Government more profoundly affects the moral tone of politics, the fate of parties, or the efficiency and economy of administration. If anything could add to our astonishment at such astounding results being possible under our system of freedom and publicity, it would be the fact that they have been accomplished, not by law, not according to the Constitution, not by any action of Congress, not by any consent of the Executive, not after any public debate, but solely through arbitrary rules of the Senate, adopted in secret sessions, of which nothing was reported and nothing known by the people. Every grade of appointments and removals made by the President, . . . with all the corrupt influences, the bartering of votes in the Senate for votes for senators or their friends, the scandalous relations between a senatorial vote for a nomination and another nomination made or to be made, . . . together with all the vicious relations between the confirmation of postmasters and collectors, and the partizan corruption with which senators may be connected in the States and cities—all these things are covered in the impenetrable, everlasting darkness and silence of these secret sessions, which the senators have interposed between themselves and the President and the people."

Mr. J. W. Sullivan says, in the *American Federationist*:

"A Senate in a democratic republic is like a fifth wheel to a wagon. It is cumbrous, useless, and ab-

surd. Serious argument for it, from any point of view, breaks down. Its existence but indicates a political superstition. . . .

"The Senate was not meant to be democratic in this land of equal rights.

"It was meant to 'put down the brakes' on hasty law.

"1. The Senate is not democratic. On the floor of the Senate, Nevada, with 40,000 inhabitants, counts as much as New York with 6,000,000—a travesty on the democratic idea.

"The admission to the Union of 'rotten borough' States, such as Idaho and Wyoming, has come about mainly because one of the two old political parties has hoped thereby to gain party ascendancy. The United States Senate, more than any other factor, keeps alive the idea of State as opposed to nation. Were there no Senate, the House, representing as it does congressional districts, might be a truly national body with a tendency to ignore State lines. As the members of the Senate are elected by the legislatures, a candidate may thus be made senator against whom might be polled a popular three-fourths majority. The term being six years, a senator may remain in office long after the issues on which, if any, he was chosen, have passed away. He may continue voting against bills embodying a sentiment favored by a large majority of the people in his State and voted for by a majority in the lower House from his State. A number of plutocratic or corrupt senators in combination may prevent legislation demanded by the majority in the country, a two-thirds majority in the lower House, and the President. In the States the existence of the Senates, besides giving rise to many of the abuses seen in the national Senate, breeds disturbance and corruption. Gerrymandering in senatorial districts is a common political crime. Where the two parties are about matched, the control of the State Senate and the election of a United States senator call out all the devices of the politician. 'A conspiracy to steal the Senate' is a familiar newspaper headline. In all the respects just mentioned, the Senate stands as an anti-democratic institution.

"2. No one need credit nowadays the assertion that a Senate is necessary as a check on the people's legislation. Where is the evidence that it is, or ever has been? On the contrary, illustrations that it emphatically is not are numerous. To begin with the plainest and simplest examples: No New England town has ever found reason to take from its people their full legislative power in town meeting. The town as a whole is left to profit alike by its successes and its mistakes. And so it is with the trades-union, the benefit society, the fire company, the building association. In larger business organizations, as has been pointed out, the Senate has never existed. In the subdivisions of States the upper chamber is meeting with disfavor. Brooklyn a few years ago, under a new charter, devised by trusted citizens, reduced its municipal legislature to one body. New York City for some decades has had but one. In Switzerland not one of the 22 States has ever found a Senate necessary."

(See, also, CONGRESS; CONSTITUTION; PLUTOCRACY.)

SENIOR, NASSAU WILLIAM, was born at Offington, Berkshire, in 1790, was educated at Eton and Oxford, and commenced the practise of law in 1810. He was appointed professor of political economy at Oxford in 1826; was made secretary of the House of Lords in 1836, and was member of various commissions and societies. He was interested in Eastern studies, but wrote but little in that line. He was correspondent of the Institute of France (1843) and author of several reports and articles on industrial questions, mainly published in the *Quarterly Review*, the *Edinburgh* and *London Reviews*. He has left as his principal works: *Lectures on Political Economy* (1826) and *An Outline of Political Economy*, which first appeared in the *Encyclopédie Métropolitaine* (1850). He died at London, June 4, 1864. He was the author of the now nearly discarded Wage-Fund Theory. (See WAGES.)

SERFDOM. See FEUDALISM; MIDDLE AGES.

SHAFTESBURY, ANTHONY ASHLEY COOPER, SEVENTH EARL OF, was born in London in 1801, and educated at Chiswick, Eton, and Oxford, where he took a first class in classics in 1822. He entered Parliament in 1826, representing Woodstock 1826-30, Dorchester 1830-31, Dorset 1833-46, and Bath 1847-51. He supported the administrations of Liverpool and Canning, was commissioner of the India Board of Control (1828), Lord of the Admiralty under Peel (1834-35). He succeeded his father in the peerage (1851). Altho a Tory, he was independent. He commenced his public labors for reform in 1828 by his speech on the barbarous treatment of lunatics, and was mainly influential as chairman of the Lunacy Commission in securing the bill which has been called "the Magna Charta of the liberties of the insane." By 1833 he became, largely through the influence of Oastler (*q. v.*), the acknowledged Parliamentary champion of factory legislation (*q. v.*); costing him political preferment, but earning him the title of "The Working Man's Friend." He worked incessantly in the ten-hours' movement. (See SHORT-HOUR MOVEMENT.) He made numerous personal investigations of factories and factory life, and made all England shudder with his revelations. The Children's Employment Commissions of 1842-43 were mainly due to him. He secured the passage of the Factory Act of 1844 and the famous Ten-Hour Act of 1847. An Evangelical of the Evangelicals, he incurred opprobrium, contempt, and misrepresentation, yet was president of numerous Bible societies and head of the so-called Exeter Hall school of Low Churchmen. He was an active opponent of slavery throughout the world till his death in 1885.

SHAKERS is the name commonly given to a religious sect in the United States. The official name of this sect is the United Society of Believers in Christ's Second Appearing; but its members have accepted the designation of Shakers, originally applied to them in ridicule, on account of certain rhythmical movements of the hands and arms which form part of their worship. Shaker societies are found only in the United States, but their creed had an English origin. The founder of the sect, in whose person they believe that Christ has appeared a second time, was an Englishwoman named Ann Lee, a native of Manchester, who believed that the Christ spirit appeared to her in 1774, in Manchester, England, as a baptism of fire after she had confessed her sins to James and Jane Wardlaw, Quakers.

Ann Lee was the daughter of a blacksmith, who gave her no education and sent her, while a mere child, to work in a cotton-mill. She seems to have been a violent, hysterical girl, but to have always possessed a great deal of influence over the people around her. She married a blacksmith named Stanley, and had four children, all of whom died in infancy. She became one of the earliest believers in a prophetess, who appeared in the town of Bolton-on-the-Moors, in Lancashire, named

Jane Wardlaw, who believed she had "received a call" to go forth and testify that Christ was coming to reign upon the earth, and that his second appearance would be in the form of a woman, as prefigured in the Psalms. Ann Lee, on her conversion, began to preach the same message, but soon went beyond her teacher and gained the leadership of her co-believers. She was charged with an obstruction of the streets, and sent to the Old Bailey prison in Manchester. When she came out of prison she gave forth that one night a light had shone upon her in her cell, that the Lord Jesus stood before her, and that he became one with her in form and spirit. But being much mocked and even persecuted in England, in 1774, with eight disciples, she emigrated to America and located finally at Watervliet, near Albany, N. Y. Her husband came with her, though he did not believe in her claims, and when she began to preach celibacy he left her. Slowly converts were made. In 1780 Ann, through her denunciations of war, was arrested and imprisoned as a British spy, but it served simply to advertise her. In 1781 she made a missionary tour through New England and elsewhere, and made many converts. Returning to Watervliet in 1783, she died about a year after. Her death was a surprise to many of her followers, who believed that she was to live among them forever; but her successors, to whom on her death-bed she had made over the headship of the society, declared that she was not dead, but had only withdrawn from common sight, and was still visible to eyes exalted by the gift of grace.

By Joseph Meacham and Lucy Wright, the successors of "Mother Ann," the Shakers were gathered, in 1787, into settlements, ten in number, and a covenant was drawn up embracing the chief points of their creed and of the social system since associated with it. Their head was, of course, "Mother Ann"—that is, Christ—of whom Joseph and Lucy were temporarily the representatives; elders and deacons, male and female, were appointed, the institution of celibacy was confirmed, and a community of goods was introduced through, as it was said, a revelation from Ann Lee. By 1792 the present order was fully established.

There are now some 15 societies, located in New York, Massachusetts, New Hampshire, Ohio, Kentucky, Connecticut, and Maine. Each society is constituted of several families, each family being a community in itself, having its own lands, buildings, and business. In Mt. Lebanon, N. Y., their largest community, there are several families, made up of 150 adults, 35 boys and 40 girls, or a total of 225 members. This has been the home of Elder Frederick W. Evans, the best known of the Shakers. The other societies are made up in about the same ratio as the one at Mt. Lebanon. The Eastern societies have about 650 members; Watervliet and Groveland about 100 members; and the Western societies about 500 members.

The capital of all the communities is mostly in land. Originally the communities invested their surplus income in land; now they are

selling it off as fast as they can find purchasers. For many years broom-making, gardening, seed business, medicines, etc., were profitable industries. One of their number says the income of all the communities does not any more than balance the expenditures in taxes, repairs, living, comforts, and improvements; but that having good simple food and hygienic clothing, with useful buildings supplied with modern conveniences in heating, lighting, sanitation, and hygiene, they have a heaven upon earth, and are therewith content.

Professor Ely says in his *Labor Movement in America* (p. 42):

"Their numbers have declined in recent years, but they claim, all told, still some four thousand members, while their property is of great value. They like to say little about property and numbers, as they have small respect for the 'statistical fiend' so common among us, and feel that a numerical table cannot properly measure either their success or their influence. One who has been some time with them estimates their property at twelve millions of dollars at least.

"Economically, the Shakers have been a complete success, and it is said that there has never been a failure among them. They look forward to the future with hope, believing that their history has just begun."

They hold that God is dual—father and mother. Thus Shakers have a dual government—male and female leaders. Their theology is not adverse to Christianity. The God of the Jews was not Deity, but a tutelary divinity—the "God of Israel" only. Christ was "the Lord from Heaven, a quickening spirit," that appeared to Jesus after John had baptized him with water.

A Shaker writes:

"The Shaker order is the 'New Heavens,' in which all live. The American secular government is the 'New Earth.' We wish it to be more secular by radically separating Church and State, having no chaplains and no religious legislation. Expunge 'In God We Trust' from the coins. Open libraries and museums and the World's Fair. Let sovereign people go where they please every day by law. Let intellectual celibates of both sexes fill all the offices (leaving married people to care for their own household) from the Presidency and legislature down to the police. Let half the army and navy be females. Abolish tobacco, opium, alcohol, trusts, and land monopoly, poverty and diseases of all kinds. Let married people become Jews, using their procreative powers for offspring only. Stop the propagation of sick people, paupers, criminals."

Their society is recruited mostly by young men and girls, but occasionally married persons with their children come "into union." Husbands and wives, when they have come "into union," become as brothers and sisters. The education of the children attached to the society is the work of the sisters. The brothers and sisters take their meals in a common room, eating at six in the morning, at noon, and at six in the afternoon. Their meals are taken in silence, any direction that has to be given being given by a gesture or in a whisper. In their church service music bears a prominent part, the hymns and chants which are used being all of Shaker origin, communicated to believers in dreams and reveries by the spirits with whom they have communion.

"**SHALAM.**"—The Faithist Colony at Dona Ana, N. M. This colony is the result of the teachings of the religious book or bible Oahspe, published in 1882. The colony is managed by believers in Oahspe, or "Faithists." The basic idea of the colony is that to improve society one must commence with children and not adults, and therefore the community is a home for children. Castaway infants and foundlings are taken to be raised upon a purely vegetarian diet, free from the impure habits of civilization. They are raised as brothers and sisters, holding all things in common.

They are not to be taught creeds and dogmas, but to live religion in every-day life, and to worship the Great Spirit, Creator of the Universe, only.

They will be taught all useful trades and industries. At suitable ages they will be encouraged to marry and continue the work which has been their salvation, and take in uncared-for children. The colony believes that if the Shakers had allowed their young people to marry they would to-day be the strongest religious community in the United States. They have proven the advantages of communism, but have not been able to hold their people because of extreme ideas.

At present (1893) the colony consists of ten children and five adults, a new building of brick capable of accommodating 60 children, with their caretakers, has just been built.

Seventeen hundred acres of land in trust for the children, and ample financial support to insure the success of the enterprise, give the new movement a local habitation and a name.

No fixed and unchangeable laws will hamper progress in a Faithist community. Laws are for those who make them, and pass away with the going out of office of the law-maker.

The government is in the hands of a chief elected annually, whose decree is absolute. In the settlement of a question of policy all can express their light and knowledge on the subject; then the chief decrees, it may be with the minority; but all agree to agree and obey.

Thus it is claimed that majorities count for nothing, but the best knowledge comes to the front.

For an account of Oahspe, see *Appleton's Annual Cyclopaedia* for 1891, article *Oahspe*.

SHAW, ALBERT, was born in Butler County, Ohio, in 1857. Studying in the common schools, he entered Iowa College, graduating in 1879. He then took charge of a semi-weekly newspaper in Ohio, but in 1881 went to Johns Hopkins University and studied political science. From 1884 to 1891 he was political editor of the Minneapolis *Daily Tribune*, but in 1888 went to Europe for a year and a half and studied municipal government, gathering information later used in lectures on municipal government at Cornell, Johns Hopkins, and Michigan universities; in articles in the *Century*, *Scribner's*, and *Forum* magazines, and later developed into book form. In 1891 he established the Amer-

ican *Review of Reviews*, of which he is still the editor. His main works in book form are *Icaria, a Chapter in the History of Communism* (1884); *Cooperation in a Western City* (1886); *Municipal Government in Great Britain* (1895); *Municipal Government in Continental Europe* (1896).

SHAW, GEORGE BERNARD, was born in Dublin in 1856. In 1876 he came to London and soon gained reputation as a brilliant journalist and musical critic. He became interested in social reform through Henry George, and on the founding of the Fabian Society (*q. v.*) in 1883 was one of its foremost members, a position he still holds. His novels, *An Unsocial Socialist* and *Cashel Cyron's Profession*, and his plays, *Widows' Houses* and *Arms and the Man*, and his essay, *The Quintessence of Ibsenism*, besides his numerous Fabian essays, have made him well known in the journalistic and dramatic and literary world, while his musical criticisms in the *World* and other papers, are considered among the best in London. Into them all he works in most various ways his brilliant presentations of the ideas of Fabian socialism. (See **FABIAN SOCIETY**.)

SHEARMAN, THOMAS GASKELL, was born in Birmingham, England, in 1834, but in 1844 his parents moved to New York City, where Mr. Shearman was educated privately. He entered the law; being admitted to the bar in 1859, and has developed an extensive business. Always opposed to slavery, he joined the Republican party as soon as it was formed, continued in it till 1884, when he became an Independent until 1892, and then joined the Democratic party. Originally an ardent protectionist, he was converted to free trade in 1860, and since 1879 he has devoted most of his leisure time to that cause.

Being strongly opposed to every form of state socialism, Mr. Shearman belongs, in a general sense, to the individualistic school of economists. He is not a disciple of the new "historical school," for, although fully believing that sound theories can only be attained by a careful study of historical facts, he also believes that historical records are so inaccurate as to afford no true light or guidance, unless constantly studied with reference to some provisional theory, and treated with suspicion, wherever they conflict with sound reason. But when a fact is once established, he abandons without hesitation any theory which does not include that fact. Unnatural and unscientific taxation he believes to lie at the foundation of nearly all those evils which socialists seek to remedy by socialism.

With these views, it can readily be understood that Mr. Shearman's principal interest in economic questions centers upon methods of taxation. His attention has been almost exclusively directed to the abolition of all indirect taxation and of all taxes upon earnings, consumption, and personal property, and to the concentration of all taxes upon economic rent. He originated the plan for giving local option to cities and counties, in methods of

taxation, as the only practicable method of settling the controversy over the taxation of personal property. He was the first to devise a plan for an income tax upon the income of invested wealth alone, exempting all earnings from skill or labor.

Mr. Shearman has been prevented by the pressure of business from writing any complete book on economic subjects, but is the author of numerous pamphlets, a few of which are: *Short Talks on Free Trade* (1880); *Protection the Poor Man's Friend* (1882); *Does Protection Protect?* (1883); *The Pauper Labor of Europe* (1885); *Distribution of Wealth* (1887); *The Single Tax* (1887); *Who Own the United States?* (1889); *Crooked Taxation* (1890); *A Just and Collectable Income Tax* (1893).

SHORT-HOUR MOVEMENT, THE.—

The movement to reduce the hours of labor for wage toil, sometimes called the eight-hour movement, owing to the fact that a large proportion of the present effort is to reduce the hours to eight, is among the most important portions of the modern labor movement. In the United States, especially, it furnishes the one direction in which all labor organizations are agreed at present to move. Out of it has grown in America a so-called eight-hour philosophy, which is held by its adherents to be a complete philosophy of the labor movement and to furnish a program not to be looked at as simply one plank in a labor program, but as a proposition complete in itself, including most socialist propositions and furnishing in its outline a solution of the whole labor question. It may be considered the philosophy of American trade-unions. In Europe, if the short-hour movement is not looked upon as complete in itself, it is considered among the most important portions of other programs. Hence the modern trade-union and socialist movement, especially in America, cannot be understood, without understanding both the history and the so-called "philosophy" of the short-hour movement. We shall consider therefore (1) the history of the movement in all the principal countries, (2) the so-called "eight-hour philosophy," (3) the arguments for reducing hours, (4) the objections to it.

I. HISTORY.

The history of the short-hour movement begins in England. Thorold Rogers says (*Six Centuries of Work and Wages*, pp. 327 and 542):

"It is plain that the day was one of eight hours. . . . The artisan who is demanding at this time an eight-hours' day in the building trades is simply striving to recover what his ancestor worked by four or five centuries ago."

Some writers deny this, but even according to the Statute of Apprentices (5 Eliz., c. 4), when the hours of labor were to be 12 in summer and during daylight in winter, two and a half hours were allowed for meals, while the law was notoriously not observed. In the seventeenth century there is good evidence that the hours were growing considerably longer. William

Petty (*q. v.*), whom Karl Marx with no little reason calls "the father of political economy, and to some extent the founder of statistics," says that in the last third of the seventeenth century there was a ten-hour day. In the eighteenth and nineteenth centuries we come to more certain facts. From 1790 to 1820, the hours were practically unlimited, and often even for children 15 hours and over. Those who would know the horrors perpetrated in England during this period of the triumph of absolute *laissez-faire*, should read Karl Marx's sketch of the period, in the first volume of his *Capital*, based on absolute documentary evidence. Mills were often run day and night, children were obtained in gangs from the poor-law guardians and worked in two sets, lodged in sort of pens with one set of beds; one set of children occupying the beds while the other set worked, and *vice versa*. The children were carried from the beds to the mills and from the mills to the beds. Where this was not done hours were over 12. Terrible evils resulted, and in 1796 a board of health in Manchester was appointed to investigate the conditions in the mills, the investigation being caused by the statements of a physician, Dr. Aikin. In 1802 the elder Sir Robert Peel brought in and carried a bill to allay the worst evils. It accomplished little, but furnished a precedent. It applied only to pauper apprentices and limited the hours of only the little children to 12! The short-hour agitation, however, had already commenced. Says Sidney Webb and Harold Cox's *The Eight-Hours' Day* (p. 15):

"At the beginning of the present century the ordinary working-day of the English artisan appears to have varied from 11 to 14 hours. In the new industries, such as the textile manufactories, the employers, being free from traditions, often exacted a still longer day. The London bookbinders were working 12½ hours a day (14 less meal-times) in 1780, when a trade-union was formed to obtain a reduction of an hour a day."

This movement became successful in 1786. King George III. was the first employer to accord the boon, which he did to the "finisher" in the Royal Library. The "second hour" was gained in 1794, and another half-hour about 1810, after an unsuccessful strike in 1806. Eighty years ago, therefore, the London bookbinders had won for themselves the ten-hours' day."

In 1815 another Parliamentary inquiry took place and an act of 1819 forbade the employment of children under nine, and fixed the hours of children of 9 to 16 at 72 hours per week *exclusive* of meal-times. In 1824 a bill was passed partially giving trade-unions (see COMBINATION LAWS) the right to organize, and from this time agitation became more active. In 1825 Sir John Hobhouse carried through Parliament another bill, making legal provision for a Saturday half-holiday. Already, however, further progress was demanded. Says *The Eight-Hours' Day*:

"The eight-hours' dream has certainly been in the minds of trade-unionists in England ever since the repeal of the Combination Laws in 1824, and has recurred at every season of reviving industrial prosperity since that time.

"And even before this date a serious proposal to reduce the hours of factory labor to eight hours was apparently made by Robert Owen in 1817. At that date, when even children were kept at work in the textile mills for 15 or 16 hours a day, the proposal of an eight-hours' day must have seemed simply absurd.

Previous Centuries.

Robert Owen instituted a regular working-day in his mills at New Lanark of 10½ hours net, and he lived to see an even shorter day made universal in the textile industry."

In 1830 Richard Oastler (*q. v.*), "the Factory King," became converted to the labor movement, and commenced, and for 18 years, through persecution and imprisonment, carried on his agitation for a ten-hour day. His motto was "ten hours and a time-book." He accomplished little, however, till Lord Ashley (the Earl of Shaftesbury, *q. v.*) took up his cause. In 1831 Sir John Hob-

house secured an act forbidding in the cotton trade the employment of persons under 21 by night, and all persons under 18 over 69 hours. In 1832 Tom Sadler, the factory representative, moved a ten-hour bill.

In 1833 an act mainly due to Lord Ashley limited the hours of children under 13 to 48, and enacted several advantageous subsidiary provisions. Agitation, however, went on.

The manufacturers too threw every obstacle in the way of the Factory Acts. Most of the provisions hitherto applied only to certain trades like the cotton trade; but in 1840 a commission found grievances very wide spread, particularly in mining, where men, women, and children worked half-naked, 11, 12, and often 16 hours. This produced the Mining Act, which forbade the employment underground of women and of boys under 10.

The Act of 1844, under Sir Robert Peel's government, classified adult women as "young persons," and extended the provisions of the Mining Act to the textile trades, yet left so many loopholes to the manufacturers that they scarcely opposed it, tho even Liberals like Cobden and Bright protested against most of the Factory Acts.

In 1847 was enacted the great ten-hour bill introduced by Mr. Fielden. It enacted a ten-hour day for both men and women. It was unquestionably a great advance, and yet its enactments were so often avoided that in 1850 another bill was passed to try and enforce its provisions. Agitation continued.

In 1860 there was a revival of the nine-hour movement, but industrial depression, later, made it cease. Beginning with 1871, however, there were numerous strikes for a nine-hour day, and by 1872 such demands had been granted to most skilled artisans. Legislation

too went on. Omitting minor bills the act of 1864 extended the Factory Acts to many trades, the act of 1874 reduced the hours in the textile trades from 60 to 56½ a week, the act of 1878 codified all

the factory acts. In 1878 and 1879, however, many employers undertook to revive the ten-hour day, and there were many strikes (*q. v.*). In 1881 the present socialist movement began in England, and by 1886 produced a strong agitation for an eight-hour day. Says *The Eight-Hours' Day* (pp. 21-33):

"During the year 1888 the movement received a very great impetus from the growth of the 'New Unionism.' The new sense of solidarity in the ranks of labor, which was so marked a feature of the match-makers' strike in 1888, led to the formation and rapid

extension of trade-unions among workers who were either unskilled or who had, for other reasons, hitherto been without organization. As these unions were formed usually under the prevailing socialist influence, and especially through the exertions of Messrs. John Burns and Tom Mann, most of them adopted an eight-hours' bill as a part of their program. One of the most flourishing of these new unions, the 'Gasworkers and General Laborers' Union,' demanded, in November, 1888, a reduction of their hours from 12 to eight per day. In nearly all the gas-works in the United Kingdom this reduction was conceded without a strike, and in many cases was accompanied by a slight increase in wages. Such a signal success gave an immense impetus to the general eight-hours' movement.

"The International Trade-Union Congress had appointed the 1st of May, 1890, for a simultaneous international demonstration in favor of an eight-hours' law. . . . It was decided to hold a London demonstration in Hyde Park on the first Sunday in May, and a similar decision was taken in other towns. No fewer than 16 platforms had to be provided, and at least a quarter of a million persons were present. Experienced journalists agreed that no demonstration for 20 years had equaled it in magnitude."

Of the condition of the question in England in 1891, which may be said to be the present position, *The Eight-Hours' Day* says (p. 37):

"It may be said that nearly all philanthropic opinion, and a vast preponderance of the wage-earners, are in favor of an eight-hours' day. This is resisted with almost equal unanimity by the 'business' world and capitalist opinion generally. Those who are in favor of an eight-hours' day are, by a fair majority at any rate, in favor of securing it by legislative enactment, which for the moment chiefly finds expression in support of the miners' eight-hours' bill. Socialist influence and much of the modern radicalism work strongly in the same direction. A majority of the wage-earners appear to be in favor of legislation; a large majority of the middle class, the political economists, and professional men are against it. The members of the House of Commons are gradually being won over to it, but secretly dislike it. In certain industries—such as the railway and tramway service, and coal-mining—there is an enormous preponderance of feeling in favor of legislation, and this preponderance is having great effect as regards legislation for those industries only."

AUSTRALIA.

Next to England came Australia in agitating the short-hour movement, and with such success that Australia may be called an eight-hour country. Our account of the movement in Australia, as in the other countries, is abridged from Messrs. Webb and Cox's *The Eight-Hours' Day*:

When the gold discoveries had given the first great impulse to the growth of industry in Australia, the usual working-day for artisans seems to have been 10 hours. During the early prosperity of Victoria artisans' wages rose to a fabulous height, and the trade-unions, instituted on English models, were able practically to impose their own terms. The old ideal of an eight-hour day soon came to the front.

The record of the movement in Australia begins with a public meeting held by the stone-masons in Melbourne at the beginning of April, 1856. An "eight-hour league" was formed at a meeting of the united trades, and immediate notice was given by public announcement that, after the 21st of April, 1856, no man belonging to the unions represented would work for more than eight hours a day. The strength of the artisans' position in the labor market at that time was such that no

resistance was possible, and the eight-hour day, thus won by less than three weeks' agitation, has ever since been general among the artisans of Melbourne. The 22d of April has annually been kept by them as a public holiday, and is now known as the Eight-Hour Day.

From Melbourne the eight-hour movement quickly spread to the other parts of the colony, then very sparsely inhabited, and also to New South Wales. An eight-hour day was generally established in various skilled trades in Sydney, within a few years, but it is by no means universally adopted, especially in the smaller towns. Subsequently the movement spread to Brisbane, Adelaide, and most of the towns of New Zealand, and public opinion thoroughly supports eight hours as the normal day for artisans throughout the whole of Australasia.

At the time when the Melbourne workmen obtained their eight-hour day, there was neither need or possibility of securing it by legal enactment.

A Royal Commission, however, was appointed in 1882 to investigate the subject. The evidence taken revealed that the supposed universal sentiment in favor of an eight-hour day had not sufficed to protect various large classes of workers, such as bakers, shop assistants, and attendants in restaurants, from being kept at work for excessive hours.

As a result, in 1885 an act fixed an eight-hour day for all women and boys, and provided many other labor regulations.

Both in Queensland and New Zealand bills establishing a normal eight-hour day were passed by the Lower House of the legislature, which is elected by manhood suffrage, but were rejected by the Upper House, representing the propertied class.

It may be said that public sentiment in Australia is universally in favor of an eight-hour day, but that this sentiment, backed up by very powerful trade-unions, has by itself as yet succeeded in securing the eight-hour day only for skilled artisans and a small minority of laborers. We accordingly find this public opinion resulting in Victoria in a whole succession of legal enactments, from 1874 down to the present time. By these an eight-hour day is legally enforced for women in all manufactures whatsoever; for miners underground; for engineers in charge of mining machinery; for tramway workers; for men employed by the contractors on various public works; for the servants of public bodies. And attempts at similar legislation in the other colonies are constantly being made, but have, as yet, been defeated by the capitalistic second chambers.

FRANCE.

The eight-hour movement on the Continent seems to have arisen first in Paris.

One of the first results of the revolution of 1848 was a decree limiting the hours of labor.

This decree (dated March, 1848) enacted that the hours of labor should not exceed 10 per diem in Paris, and 11 per diem elsewhere in France. It was modified by the law of the

9th of September, 1848, which established 12 hours net as the maximum working-day.

It is hardly necessary to observe that this hasty legislation was completely ineffective. No inspectors were appointed or other means taken to secure the enforcement of the law.

To the plutocratic Caesarism which followed the republic, the law itself was altogether repugnant. It was not, indeed, explicitly repealed; but it was ingeniously eaten away by a series of decrees.

With the advent of the third republic, a change came over the attitude of the government. In May, 1874, 15 inspectors were appointed to control the operation of the law of 1848 and its amendments. In the same year, and again in 1883, more stringent factory laws were enacted for women and children. On the other hand, in November, 1885, an administrative circular was issued, excluding from the operation of these laws all work-shops where only human labor force was used, and where fewer than 20 workers were employed in one building.

The law of 1848 is, however, still nominally in operation, and is so far effective that it was thought necessary, by a decree of the 3d of April, 1889, to exempt from its observance laborers employed on any works executed by order of the government in the interest of the national safety and defense. Nevertheless, so numerous are the exceptions that very few of the workers now benefit by the law.

THE GERMAN EMPIRE.

In Germany, the demand for a law limiting the hours of labor has formed a part of the agitation of the Social Democratic party. Meanwhile, factory legislation, both Imperial and State, has to some extent regulated the labor of women and children, and this has, as usual, tended to reduce the hours of men. The law of 1st of June, 1877, with the amendments of the 17th of June, 1887, prescribes a maximum day of 10 hours for persons under 16. But the laws are very imperfectly enforced, and mills employing young persons often run 84 hours a week. Artisans work 11 and 12 hours a day. In Leipzig the masons had, in 1889, recently carried a ten-hour day; but this was a local arrangement, which has not been generally followed.

The movement for an eight-hour day exists chiefly among the Social Democrats, whatever their trade, and among the coal-miners. In 1888 the coal-miners in Westphalia struck for an eight-hour day, and secured the intervention of the young Emperor in their favor. Accordingly, in Westphalia, Silesia, and Saxony, the miners work only an eight-hour shift wherever a high temperature prevails; elsewhere a ten-hour shift is still worked. This limitation of the hours in unhealthy mines was adopted by the Berlin Labor Conference in May, 1890. Many of the workers in the mines, and other industrial establishments of the Prussian Government, have since received the boon of an eight-hour day. Other trades are moving in the same direction.

SWITZERLAND.

This republic enjoys the distinction of having been the first country to declare in its very constitution the legislative right of the nation, in its political organization, to limit the working-day even for male adults. Nor has this power been allowed to sleep. The Federal Factory Labor Law of 1877 limits the maximum hours of labor for all adult labor in factories or workshops to 11 per day, and to 10 on Saturdays or public holidays.

During 1890 a law was passed limiting the hours of railway employees to 10.

OTHER EUROPEAN COUNTRIES.

In Holland, Denmark, Austria, Italy, and Spain, a large number of the labor organizations adopt an eight-hour day as a part of their program, and such a measure is frequently pressed upon the legislatures of some of these countries by the members representing the working-classes. The international demonstration of the 1st of May, 1890, was largely participated in, not only in all these countries, but also by Poland. It may, indeed, be said generally, as regards the Continental nations, that wherever the wage-earners are organized at all, their organizations demand an eight-hour law. But labor organizations do not exist, for effective purposes, among any but a minority of the workers on the Continent.

Meanwhile, as if to stave off the demand for an eight-hour law, factory legislation of the ordinary type is being everywhere adopted or rendered more stringent. Belgium and Holland, long the fields of the most unrestrained exploitation of labor, are both enacting lengthy codes of labor regulations; in France, Germany, Spain, Italy, and Austria, the law is being strengthened; Russia and Denmark and Sweden have entered the same path. The gap between the restrictions on English and those on Continental manufacturers is certainly not widening, and, as regards most countries, it is indeed rapidly growing narrower. In some respects, indeed, such as the minimum age for children's work, the provisions relating to the employment of mothers at the time of childbirth, and the prevention of excessive overtime, England has already lost its honorable lead in factory legislation.

THE UNITED STATES.

The short-hour movement early developed in the United States. As early as 1806 the organized ship-builders and calkers in New York city sought to obtain a reduction of hours to 10. By 1825 strikes for a ten-hour day were numerous.

The hours of labor at that time seem to have been about 12 per day for artisans. The textile workers were less fortunate. The working-day, even for women and children, often began at 4.30 A. M., and went on for 15 hours. Most of the New England mills ran 13 hours a day all the year round. It is not generally remembered that the factory girls of Lowell, in the classic days of the "Lowell Offering" (1832-40), worked 78 hours per week. In 1831 an organization of working men was formed at Boston to secure, among other objects, a ten-

hour day. A wide-spread agitation resulted in innumerable strikes, few of which were successful. The ten-hour day became, however, general in Baltimore between 1835 and 1840, as the result of a strike among the laborers. Shortly afterward, President Martin Van Buren (April, 1840) proclaimed that the working-day in the Navy Yard at Washington and all other public establishments should be reduced to 10 hours. This led to a general adoption of the ten-hour day in ship-building establishments which has been since maintained. In 1847, however, the masters made a determined but unsuccessful attempt to revert to longer hours.

On June 16, 1845, a large mass-meeting, attended by 5000 persons, was held at Pittsburg, Pa., for the same purpose, and led to similar action elsewhere. In October, 1845, the first national industrial convention in this country was convened at New York, to organize concerted action toward the same end. Mass-meetings and strikes for the ten-hour system now became very frequent, and in many cases were successful.

In 1845 the textile workers of Massachusetts petitioned the legislature for a ten-hour bill. The first legislation on the subject that we have been able to trace is a law of 1849 of the State of Pennsylvania, providing that 10 hours shall be a day's work in cotton, woolen, silk, paper, bagging, and flax factories, and masons had generally won the ten-hour day. The textile operatives were less fortunate. Some of the mills at Lowell adopted the new hours in 1853, but as late as 1865 the mills at South-bridge were still running 13 hours.

In 1866 the National Labor Union was formed at Baltimore, and it was this body which gave the first great impulse to the movement.

The agitation thus set on foot received legislative recognition in Connecticut in 1867, when it was decreed that eight hours' work should be a day's lawful labor *unless otherwise agreed*.

On June 24, 1869, a bill for an eight-hour day was introduced into Congress by General Banks, whose wife was once a factory girl at Lowell. This passed the House and Senate, promptly received the signature of President Grant, and was enforced in the Navy Yard at Charlestown, Mass., July 6 of the same year, tho the employees were notified that the Government would reduce wages one-fifth; but that those who so desired could work 10 hours at the old rates. The eight-hour law is still on the statute-books, and a like law exists in several States, but is often a dead letter.

In 1869, however, the so-called Eight-Hour philosophy was first adequately formulated by two Boston men, Ira Steward and George E. McNeill. A Grand Eight-Hour League had been formed previously, but had disappeared, when these two men, with a few friends, now organized the small but influential Boston Eight-Hour League. With the aid of Wendell Phillips and others, they succeeded the same year in securing the establishment of the Massachusetts Bureau of Statistics of Labor, the parent of all other

**Eight-Hour
League.**

labor bureaus. General Oliver was appointed commissioner, with Mr. McNeill as his deputy and the chief manager. The Bureau's statistics aided the eight-hour movement. Agitation for shorter hours became general. There were numerous strikes, many of them successful. Eight-hour leagues were formed in many cities, and there were many strikes; 20,000 workmen paraded New York City demanding the eight-hour day. In 1874 Massachusetts enacted a ten-hour law for women and for children under the age of 18.

The industrial depression which set in after 1873 throughout the United States caused the question of any further reduction of the hours of labor to fall temporarily into abeyance. The great railway strikers of 1877, and other labor disputes during this period, related mainly to proposed reductions in wages. This is probably the reason why the Knights of Labor did not make the eight-hour day at first an express demand. Even at the General Assembly in 1878, when a full "Declaration of Principles" was adopted, the eight-hour day was not expressly mentioned. The eight-hour clause, now No. xxi., "To shorten the hours of labor by a general refusal to work for more than eight hours," was apparently added about 1883. However, a vigorous effort to institute an eight-hour day was made in many parts of the United States in the spring of 1886. *Bradstreet's* estimated the number of strikers for shorter hours in May, 1886, at 200,000, of whom 50,000 were granted their demands, while 150,000 secured shorter hours, generally with full pay, without a strike. But on June 12, 1886, the same paper estimated that one-third of these had lost what had been conceded to them, and predicted that a still larger number would lose the advantage gained. The great meetings held at Chicago in May, 1886, in support of the movement, were taken advantage of by the anarchists to spread their ideas, and this led to the so-called Haymarket riot.

During the years 1888 to 1890, numerous attempts were made to secure an eight-hour day in particular trades and particular localities, and at the convention of the Federation of Labor at St. Louis in 1888, it was decided to hold mass-meetings in every city on the eight-hour question on four days in the year, including July 4, 1889; Labor Day, September 2, 1889; and Washington's birthday, February 22, 1890.

It was also decided to strike, trade by trade, for the eight-hour day on each 1st of May, one trade at a time, all the other trades being pledged to support it all over the country. The carpenters were chosen to strike in 1890. To a large extent they did so, and in many cities won the eight-hour day, tho in some where they won, the hours were subsequently lengthened. In 1891 the miners were to strike, and some did, but dissensions prevented a general movement. Since then the movement has taken a more desultory form. America still compares unfavorably with England. American textile operatives and coal-miners, in particular, work considerably longer than do Englishmen engaged in the same trades. In New England, New York State, and Pennsylvania, the working-day is still 10 hours, tho

some few labor for more than that time. In only a few States are the hours of male adults limited by law, and then only in special industries. On the other hand, various legislatures have attempted to lead public opinion by declaring eight hours to be the normal working-day. In spite of this encouragement, very few trades have succeeded in actually securing an eight-hour day. In Massachusetts the 58-hour week has been gained for women and children, and so practically for men. In one State, Wisconsin, eight hours is a compulsory measure for women in manufacturing establishments. In New York the stone-masons, cigar-makers, painters, and some of the glass-workers, maintain more or less precariously an eight-hour day. The same is true of about 3 per cent. of the manufacturing establishments in Massachusetts.

Such is the history of the short-hour movement. To-day almost all economists and reformers favor a shorter day, the only question being how rapidly it can be introduced, and in what ways. A few economic individualists and some of the older trade-unions, objecting to industrial legislation, favor effort to obtain a reduction of hours by trade-union effort alone, by agreements with employers, etc. A few extreme socialists consider such efforts hopeless and would have nothing but legislation; most supporters of the movement believe that the two lines of effort should go together. The Fabian Society of London has outlined a policy of short-hour legislation with trade option, of which the following is the essence:

"Where it is proved to the satisfaction of a Secretary of State that a majority of the persons employed throughout the United Kingdom, in any one trade or occupation, are in favor of the maximum hours of labor per week in that trade or occupation being fixed by law, or, if already so fixed, being altered by law, he may, by order made under this part of the act, declare a maximum number of hours per day or per week for such trade or occupation, and after the expiration of *three months* from the date of publication of such order, any person employed in contravention thereof shall be deemed to be employed in contravention of this act, and the person so employing him, or permitting him to be so employed, shall be liable, on conviction thereof, to a fine not exceeding £10 for each such contravention."

Almost all reformers, however, agree that in some way to reduce the hours of labor is among the most important of measures, and the old rhyme of the movement is now a generally accepted motto:

"Eight hours to work, eight hours to play,
Eight hours to sleep, eight 'bob' a day."

II. THE EIGHT-HOUR PHILOSOPHY.

In England, Australia, and Europe, the short-hour movement is not commonly based upon any one particular economic view, but is favored by socialists, individualists, and trade-unionists, simply on its merits. In the United States, however, it is commonly based, at least by its trade-union advocates, on a particular economic view that is commonly called the Eight-Hour Philosophy, and which they oppose to the socialist and other views of the labor movement. This philosophy was mainly developed by two men—leaders in the Boston Eight-Hour League, about 1869—Ira Steward

and George E. McNeill. This philosophy traces almost all economic ills to poverty, and believes that to gradually reduce the hours of labor, and so to free men to obtain higher life and to develop ability to create for themselves a cooperative civilization, is the one way at present to naturally and *permanently* relieve poverty.

We abridge the argument from Mr. Gunton's *Wealth and Progress*, because he has most fully developed this portion of the eight-hour philosophy. Mr. Gunton differs on many points from the other eight-hour men, but in the following quotations represents their thought. He says:

"The chief determining influence in the general rate of wages in any country, class, or industry, is the standard of living of the most expensive families furnishing a necessary part of the supply of labor in that country, class, or industry. . . ."

"The laborer cannot and will not work for less than that which will furnish him a living. He will, as experience shows, often work for less than what will supply him with exceptional comforts and luxuries, but he will not continuously work for less than will furnish him with that which, by constant repetition and force of habit, have become necessities. Before he will forego these he will refuse to work, and inaugurate strikes, riots, and other means of endangering the peace and prosperity of the community. . . ."

"This explains why we always find that those whose families are largest, or those who have more cultivated tastes and wants, and, therefore, whose cost of living is higher than the great mass of their class, are constantly chafing under the pressure of their unsatisfied demands."

Mr. Gunton then goes on elaborately to argue that this law holds good for all countries and all times. He says:

"If we can accept the universal testimony of travelers and historians, the cost of living among the laboring classes in the leading countries in Asia, Africa, and South America has always been exceedingly low, and their wages, so far as wages have been paid at all, have ever been correspondingly small. . . ."

"If we leave Asia and go to Europe—if we turn our attention from the industrial systems of India and China to that of England—tho the seeming is different, the fact is the same. While in other respects the conditions of society in England are entirely different from those of India and China, we find the same principle obtains in relation to wages. Altho at the time the laboring classes in England began to emerge from the system of slavery (or serfdom) to that of wages, the political, social, and religious institutions under which they lived were entirely different from those existing in Asiatic countries, there was still one feature common to them all, viz., *their material condition*.

"In England, as in India and China, the laborer's mode of life was simple, his wants were few, and his living was cheap. . . . And if we trace the progress of the English laborer from the thirteenth century to the present time we shall find that every movement in his wages, from that day to this, has been in accordance with the same law. . . ."

"The same is true of this and all other countries where wage conditions prevail. The fact that wages in the various trades in New York City are from 25 to 75 cents a day more than in the small cities and towns, in that and other States, is explainable only on the same principle.

"The testimony of Sir Thomas Brassey upon this point is ample and conclusive. He says: 'The minimum is determined by the cost of living, according to the standard adopted by the people. . . . of Wages. As we recede from the more civilized countries of Europe the standard of comfort is reduced, and the laborer is content to receive lower wages.'"

Mr. Gunton shows too that the law explains the differences of wages in different trades.

"But this, it may be said, is inadequate to explain the extraordinary difference between the rate of wages

in the building trades and that paid to the factory operatives. The employment of the latter is more constant than that of those in any branch of the building trade. It is also true that in the same locality the general standard of living of the operative is lower than that of the former. But it is no less obvious that both of these causes are insufficient to explain the striking difference in their wages."

The explanation here is that the wives and children of factory operatives help bring the men's wages up to the standard of living, while the wives and children of carpenters usually do not, so that their wages alone have to equal the standard of living.

It is for this reason that the wages of the father, as shown above, are reduced in proportion as the wife and children contribute to the support of the family.

The law too shows why men's wages are higher than women's. "As the man is much more generally the head and chief earner of the family, a much larger number are dependent upon the wages of the average man than upon those of the average woman. Again, altho the wants of the average woman in the same social environment, for amusements, travel, etc., are equal to those of the average man, they are generally furnished by the man, as father, friend, or lover, and therefore really constitute an item in the normal expenses of the man, instead of those of the woman."

The same is true, Mr. Gunton shows, in piece-work or day-work. Whether men work by the piece or by the day, they never earn much more or much less than enables their families to maintain the standard of comfort.

(See PIECE-WORK.)

It being thus determined that wages cannot be much higher or lower than the standard of living, the eight-hour philosophy next asks, What determines the standard of living? This it answers, in Mr. Gunton's words, as follows:

"The standard of living in any community will be high or low according as the social life of the masses is simple or complex, or, in other words, as the number of the daily wants of the people is large or small. It is lower in Asia than in Europe, lower in Europe than America, lower at Five Points than on Fifth Avenue, for the reason that the *wants* of the people in the former places are fewer and simpler than those in the latter. . . ."

Wants.

"But if the standard of living is governed by the wants, the question that next arises is, What determines the wants?"

"Man is a twofold being. He has a physical and a social nature, and, consequently, he has social as well as physical wants. The latter arise from his animal existence, and the former from his social relations. Therefore, his physical wants, like those of the lower animals, are few, and mostly hereditary, while his social wants are acquired and have no conceivable limit. . . . If we examine the history of man, we shall find that his wants are few or many, and high or low, according to the quality of the habits and customs of the society in which he moves. . . ."

"Therefore, how to increase the wants, develop the character, and consequently advance the wages of the laboring classes, ultimately resolves itself into the question, *How can the social opportunities of the masses be enlarged?*

"Now, so long as nearly all the laborer's time not occupied in eating and sleeping is devoted to the former, as at present, no commensurate development of the latter is possible. Therefore, the first condition for increasing the opportunity of the masses to develop their social character, and thereby increase their natural capacity to consume wealth, commensurate with their power to produce it, is *more leisure*. By leisure, however, we do not mean merely unoccupied time. Enforced idleness is unoccupied time, but it is not leisure. The masses, the world over, have a great deal of unoccupied time, but it is mainly in the form of idleness, and not that of leisure. Tho idleness and leisure are both unoccupied time, the economic and social influence of the one is directly opposite to that of the other. Idleness tends to impoverish, dwarf, and degrade, while leisure tends to enrich, develop, and elevate character. It is very important, therefore, to distinguish clearly between leisure and idleness. Nor is this difficult to do if we observe their essential characteristics. . . ."

"The immediate and most important question, the answer to which is necessary to enable us to take the first correct step toward preventing enforced idleness,

is how to wisely and permanently increase the *leisure time* of the laboring classes. To this question we are now in a position, on the basis of sound economic principles, to give a definite and emphatic answer, which is—*reduce the hours of labor.*

"In proposing a reduction of the hours of labor as the indispensable *first step* toward promoting industrial and social reform, we do not say that it is the only means that will, under any and all conditions, tend to promote that end.

"But while there are other more or less effectual means of promoting the same end, such as education, free lectures, public libraries, parks, museums, and art galleries, these are and must necessarily remain practically ineffectual, so far as lifting the community from its present industrial and social mire is concerned, unless the *leisure time* of the masses is increased."

It is thus that the eight-hour philosophy reaches its conclusion to concentrate all present economic effort on reducing the hours of labor. But this is by no means the whole of the philosophy. It goes on to show how a reduction in hours will also employ the unemployed, and by setting them to work, and giving them money to spend, increase their consumptive powers, and so still more raise the standard of living. Says Mr. Gunton on this point in a tract, *The Economic and Social Importance of the Eight-Hour Movement* :

"The adoption of an eight-hour system would tend to increase wages in two ways; first, by reducing enforced idleness; second, by creating new wants and raising the standard of living. The immediate effect of the general adoption of an eight-hour work day would be to reduce the working-time of over 8,000,000 adult laborers about two hours a day. This would withdraw about 16,000,000 hours' labor a day from the market without discharging a single laborer. The industrial vacuum thus created would be equal to increasing the demand for labor nearly 20 per cent. In other words, without increasing either our home or foreign market, but simply to supply the present normal consumption, it would create employment for 2,000,000 laborers, which is nearly equal to 70 per cent. of the total number of able-bodied paupers and unemployed laborers in America, England, France, and Germany. In thus eliminating enforced idleness it would remove the first great obstacle to industrial reform and social progress.

"Again, the employment of 2,000,000 of new laborers would necessarily tend to increase the number of consumers, and thereby enlarge the market for commodities to that extent.

Effects of Short Hours. That such a result would tend to increase wages is very clear. Although wages would not necessarily rise in the same proportion that enforced idleness is reduced, all the influences would be in that direction. It is a law in all nature that the power of primary forces increases directly as the opposing forces are reduced. Since enforced idleness is the most powerful obstruction to a rise of wages, by removing the unemployed the direct influence of the social forces which tend to promote the rise of real wages would be increased.

"Manifestly, therefore, the immediate effect of the adoption of this measure would be to remove the greatest obstacle to industrial peace and progress, and prepare the way for increasing the natural influences which tend to enlarge the general consumption of wealth and raise wages.

"The second effect, which would be more gradual, permanent, and far-reaching in its nature than the first, would be the result of the increased leisure and social opportunity upon the social character and consumption of the masses. With the removal of enforced idleness, and its degrading influences, over 8,000,000 laborers would leave their work each day less exhausted, mentally and physically, and have two hours' more leisure. This would mean so much positive opportunity for family life and for general social intercourse, and in a much fresher and more cheerful mood. With increased leisure and less exhaustion, the laborer will be continually forced or attracted into new and more complex social relations, which is the first step toward education and culture in the broadest and deepest sense of the term. In

short, it means his gradual introduction into a new social environment, the unconscious influence of which would necessarily awaken and develop new tastes and desires for more social comforts. He would naturally begin to desire more wholesome and better appointed homes, more literature, entertainment, and a greater amount of general social intercourse, not to speak of the intellectual, moral, and social improvement that would necessarily result from such conditions. The purely economic effect of this would be little short of revolution. In proportion to the frequency and extent with which the new desires were gratified, the development of which no power on earth could prevent, would they crystallize into urgent wants and necessities. The satisfaction of these would soon become an essential part of the standard of living demanded by the social character and habits of the people, and therefore would make a general rise of real wages inevitable. In fact, these are the only kind of influences which ever did, or ever can, permanently increase the general rate of real wages. This increased consumption and rise of wages means enlargement of the home market, and thereby making a greater concentration of capital and the use of wealth-cheapening machinery possible.

Such in brief are the main points of the eight-hour philosophy as far as its *economics* are concerned. As far as its practical program is concerned a few other points must still be noted :

1. The Eight-Hour Philosophy claims that this method of raising wages, by shortening the hours of toil, is not only based on the laws of economics, but suited to the character of all abiding progress, in that it can be introduced without either overturning the present system or jeopardizing the reasonable interests of employers, until all working-people be lifted up to a level where cooperative methods can be introduced and the wage system be gradually replaced by one where workmen shall be their own employers.

2. The Eight-Hour Philosophy claims that it is suited to the political and ethical sense of working men, in that it teaches them to look for advance of wages, not to legislative enactment or any other form of paternalism, but by their own efforts in gaining the shorter day, and so lifting themselves up to a fuller manhood.

While it takes this position it recognizes the proper place of government, by asking, as the first step in securing the short-hour day, that government establish an eight-hour day, not indeed in all factories, but in all government works; thus showing what can be done, what an eight-hour day means; making it thus an object lesson both to employers and employees, and so leading the community, not by law, but by example.

3. The Eight-Hour Philosophy recognizes that while industrial progress must come from the working-classes lifting themselves up through combination to higher standards of living, the power to combine and agitate for shorter hours implies already a degree of development. Hence, by working along the lines of least resistance, and by following the deep principle that to those who have is given, it holds that the eight-hour movement will develop first among the higher paid artisans, and then, through their gaining higher standards of living, will reach down and lift up those at present unable to organize for themselves. Thus the Eight-Hour Philosophy has always sought and found its chief home

among the more intelligent and the better organized trade-unions. Perhaps the whole of the philosophy may be best summed up in the resolutions passed by the Boston Eight-Hour League at its convention of 1872, drafted by Mr. Steward himself:

"Resolved, That poverty is the great fact with which the labor movement deals;

"That cooperation in labor is the final result to be obtained;

"That a reduction in the hours of labor is the first step in labor reform; and that the emancipation of labor from the slavery and ignorance of poverty solves all of the problems that now most disturb and perplex mankind.

"Resolved, That we demand legislation on the hours of labor, as follows:

"1. An amendment to the Patent Laws of the United States, by which an exclusive right to make or sell shall be forfeited when persons are employed in manufacturing an article patented more than eight hours a day.

"2. An amendment to the Acts of Incorporation of cities and towns, requiring them to adopt the eight-hour rule in the employment of all mechanics and day laborers, and the same hours to apply to the same class of work for the State, whether directly or indirectly, through persons, firms, or corporations contracting with the State.

"3. Manufacturing corporations to adopt the eight-hour system or surrender their charters.

"4. All persons under 21 years of age to be employed not more than eight hours a day.

"5. Eight hours to be made a legal day's work in the absence of a written agreement.

"Resolved, That this legislation, though affecting directly but a small per cent. of the people, will establish the facts most important for the working-classes to learn:

"That eight hours do not mean less wages;

"That men are never paid, as a rule, according to what they earn, but according to the average cost of living;

"That in the long run—within certain limits—less hours means *more* pay, whether they work by the day or work by the piece;

"That reducing the hours increases the purchasing power of wages as well as the amount of wealth produced;

"That dear men mean cheap productions, and cheap men mean dear productions;

"That six cents a day in China is dearest, and three dollars a day in America is cheapest;

"That the moral causes that have made three dollars a day cheaper than six cents a day will make higher wages still cheaper;

"That less hours mean reducing the profits and fortunes that are made on labor or its results;

"More knowledge and more capital for the laborer; the wage system gradually disappearing through *higher wages*;

"Less *poor* people to borrow money, and less wealthy ones to lend it, and a natural decline in the rates of interest on money;

"More idlers working, and more workers thinking; the motives to fraud reduced, and fewer calls for special legislation;

"Woman's wages increased, her household labor reduced, better opportunities for thought and action, and the creation of motives strong enough to demand and secure the ballot;

"Reaching the great causes of intemperance—extreme wealth and extreme poverty;

"And the salvation of republican institutions."

III. ARGUMENTS FOR REDUCING HOURS OF LABOR.

The adherents of the short-hour movement believe that all considerations—physical, economic, mental, and moral—conduce to make a reduction of the hours of the wage-toil today desirable and necessary. The best arguments, however, for reducing the hours of labor are the results of the reduction of hours that have been made. Undoubtedly the best account of these results is Mr. Rae's *Eight*

Hours for Work, published in 1894. The author commenced his studies of the subject merely to get information. His conclusion he thus states in his introduction:

"All experience indorses the wisdom of reducing the hours of labor. . . . The available evidence is unexpectedly copious, and its teaching is unexpectedly plain and uniform. In the course of the investigation I have found it impossible, personally, not to grow a stronger and stronger believer in the eight-hour day. Shorter work hours have left every nation that has chosen them at once healthier, wealthier, and wiser; and the shortening to eight seems, if I may say so, to be blessed above its predecessors. According to positive experiences of it, the eight-hour day has been almost invariably fair."

Mr. Rae's book of 328 pages is full of evidences to the good result of shortened hours.

The first point usually made by the advocates of the short-hour movement is that it is to-day an economic necessity. Invention and discovery have so increased man's ability to produce that in a few hours the modern factory can turn out more goods than men could formerly produce unaided by machinery in days or even weeks. This process of invention and discovery still con-

An Economic

Necessity.

competition to produce cheaply, labor-saving machine after machine and improvement upon improvement are constantly being introduced. The result is that if the working classes are paid no higher than formerly, their purchasing power is not increased at all in proportion to their producing power, and goods are piled up in the factories for which there is no market, the phenomenon of a so-called overproduction. It is true that this leads to lowering prices, so that the producer, tho paid nominally no higher wages than formerly, can purchase more goods, but it also makes it possible for the worker to retain the same standard of living and yet work for cheaper wages. Under competition this happens. (It is true that many statisticians deny that this has happened; but the workers and other statisticians show that it has occurred *where competition has been left to itself.*)

The only places where wages have not fallen have been in trades where labor combinations or some extraneous and exceptional circumstances have kept wages up. (For proof of this, see *WAGES*.) The workman finds himself, then, with lower wages to balance lower prices, unable, therefore, to buy more than formerly, and yet producing an ever-increasing supply of goods. Even the employers do not profit by this condition of affairs, because, tho they have much more to sell, they have to sell at lower prices to a falling market. They cannot go on increasing their goods for which they found no sale, yet they are compelled, at no little expense, to keep up with the latest mechanical inventions, because if they do not, they cannot produce as cheaply as those who do adopt the new inventions. Consequently their only resource is to produce as cheaply as possible when they do produce, and then to close their factories for a portion of the year or to work half time or one third time. This produces the phenomenon of the unemployed, and particularly the phenomenon of those unemployed half their time and

working at feverish rate the other half. This phenomenon appears to day in every manufacturing center. It is sometimes attributed by different thinkers to free trade or to protection, to free silver or to gold. That it is not due to these factors, but to the analysis we have just made, is evident, say the advocates of short hours, from the fact that the phenomenon appears alike in free trade England and protected America, in countries most fully on the gold basis, like England and Germany, and countries nearer to a bimetallic basis, like the United States and France.

Nor does the evil end here. The existence of the unemployed, and even the existence of the unemployed for a portion of the time, makes it harder and harder for trade-unions to keep up their labor combinations and their union rates.

The Unemployed. Under one pretext and another the union scale of wages falls. Employers are often literally unable to pay the old union rates, with goods piling on their shelves for which there is no market. Therefore wages begin to fall even in the organized trades. This reduces the market still more. Only the stronger firms are able to stand the crisis. Consolidation sets in; the small factories are permanently shut down; and more men and women are thrown unemployed on the market.

That this, to a very large extent at least, is true of the market to-day no informed person can deny. The only relief, say the short-hour men, is to lessen the hours of labor.

This, they say, will be to lessen production equitably through the year and not in fitful seasons. It will be as good for the employers, because they will still produce all the goods they can sell, and yet prevent a too great fall in prices. They can, therefore, afford to shorten hours without lowering wages. It will aid the men, because, in the first place, it will stop turning out more of the unemployed; and, secondly, because, according to the eight-hour philosophy above, it will raise the standard of living, give men leisure in place of idleness, increase wants, make men more capable of supporting labor unions; thus limit disastrous labor competition; so enable men to demand higher wages; with the higher wages enable them to buy more goods, and so give the manufacturer the improved market which he needs, and which will enable him to produce the higher wages. Thus steadily, quietly and naturally, say the short-hour men, will the interests and character of the community be advanced. The second argument for shorter hours is that humanity demands them.

A Humane Necessity. Labor to-day is very differently situated and employed from what it was formerly. It is becoming more and more an attachment to machinery (*q. v.*). Machinery is driven constantly faster and faster. The wear and tear on human life steadily increases. Men, therefore, need shorter hours to allow for this. "Faster locomotives can be invented," said an engineer, "but can they get men to run them?" "Not unless the hours of each worker are shortened," was the answer. The stress placed upon motor-

men in driving swift cars through narrow streets for long hours by many street-car corporations, eager only for dividends, is little less than criminal. Its cure is shorter hours and more men employed. The effect of the factory on the nerves of girls each year compelled to tend more looms or watch faster-flying shuttles demands shortened hours for increased work.

Again, humanity demands shorter hours because, where labor is made more and more dependent on machinery, unless the hours of such toil are limited the worker will become more and more of a hand and less and less of a head. Workers by brain, often unacquainted with machine toil, sometimes say, "I work at my profession 12 hours a day; why should the machine-tender complain of 12 hours?" Because there is a vast difference between brain and hand labor. Into brain labor the worker can throw his mind, his imagination, his soul, as well as to an extent his body. The hand-worker often does work almost absolutely mechanical, or into which he can throw his mind only in the narrowest grooves. Often he exerts but a single set of muscles. Inevitably the latter becomes exhausted first, because one set of muscles or mental powers used on one line cannot stand the continuous application which the brain-worker extends over many parts. The mental effects are still more disastrous. Labor without thought, or thought on a very narrow line, brutalizes. Unless laborers are to become brutes, the hand must have an opportunity to develop the head, and intenser hand-work increases the need for more time for head-work. An even greater reason, however, why humanity demands shorter hours is that they mean better homes, and better homes mean better men and women. If shorter hours, in the first place, as we have seen above, tend to check unemployment, and thus indirectly to raise wages, this means improved homes. Secondly, when the artisan can come to his home, say at five o'clock, can rest and wash and sit down to his evening dinner, or work a little in his garden before dark, there are possibilities of home life and home development utterly unknown to those workmen who go from bed to factory and from factory to bed. When such do have leisure, ignorant of home life, they are apt to spend it in the saloon. Seeing little of their families—there are workmen who never see their wives and children by daylight for months together—they do not realize the needs of the wife and children, nor feel the restraining ties of wifely and filial love. They live like the brutes, and their families become brutal. Those who work excessive hours become the lowest class of laborers. Short hours mean at least the possibility of human life. This is probably the strongest argument for shorter hours.

Thirdly, political reasons demand shorter hours. Under democracy an ever-increasing responsibility falls upon the working-classes. If they are ignorant, brutalized, besotted, popular government can only lead to evil. Democracy absolutely demands a high grade of development among the laboring classes. This is not possible when the worker is merely a toiling and sleeping ma-

Political Reasons.

chine. The safety of democratic countries absolutely demands shortened hours of wage toil.

Such are some of the principal arguments for the short-hour movement. How fully most of them are supported by facts can be seen only by those who, like Mr. Rae, have given the subject the fullest study.

Said Sir Robert Peel, in a speech as long ago as 1816, speaking of the first British factory act :

"The hours of work allowed by that bill being fewer in number than those formerly practised, a visible improvement in the health and general appearance of the children soon became evident, and since the complete operation of the act contagious disorders have rarely occurred."

Says a tract published by the American Federation of Labor, summing up the experience of England's agricultural and factory labor :

"When the agricultural laborers in certain countries of England, under the inspiration of Arch and his colleagues, secured additional hours of rest, but a short period was needed to see a marked improvement in their social condition. Flowers began to blossom around their cottage walls, dilapidated fences and broken gates were mended, the shrubbery more neatly tended and the garden more carefully cultivated. Inside of these humble dwellings, where the laborer had formerly entered at the conclusion of a long day's work only to throw his wearied body down to senseless slumber, articles of comfort began to come in ; a carpet replaced the scraped sand it may be on the floor, curtains to the windows and pictures upon the wall added a home feeling which did much to awaken the dormant manliness of its occupants. With increased comforts came increased wants ; increased wants and a higher vigor brought increased cultivation, and, hence, a higher standard of wages than on the continent, where the hours of labor remained from 12 to 16 per day.

"Even those who at first bitterly denounced all efforts to lessen factory toil as revolutionary and destructive of 'the natural degree, of society,' under the lessons of experience were becoming convinced that less hours

Results. meant not only higher wages, but improved sanitary, social and moral relations. Official reports show that within a single decade it was rare to find an operative under 20 years of age unable to read and write. Diseases incidental to factory labor disappeared, and there was an almost entire absence of deformity specific to that work ; wages increased from 12 to 40 per cent., and with the rise of consumption of products the production of textile fabrics largely increased. From 1844 to 1858 the commerce of Great Britain doubled and increased more than twice as fast as the population, while before this it hardly kept pace with it. From 1840 to 1870 the proportion of the adult population who could read and write increased 35 per cent. faster than the population, while the number of children attending public schools increased several hundred per cent. With increased knowledge has followed lectures on science and art in large manufacturing centers, and public gardens and museums have offered new inducements to the once despised worker. In the words of an English writer, 'refinement and civilization only take their date from the possession of the privileges which restricted labor conferred upon the people.' Such prominent opponents in Parliament as J. A. Roebuck, Sir James Graham, Sir Thomas Bazley, the late and most vindictive John Bright, and others, all lived to recant their dismal forebodings."

The strongest testimony, however, to the benefits of the short hour movement comes from those countries and those firms which have tried the eight-hour day. Mr. Rae, in his book (see above), has collected pages of this testimony :

One firm, Messrs. Watts & Manton, say, "The habits of the people are changing ; there is a greater desire for home life, and greater longing after the means by which it is to be rendered more agreeable." Mr. Johnston, flax-spinner and ex-Mayor of Belfast, says that under the long hours the boys used to lounge about the

street corners and frequent the public houses, but since the hours were shortened they attended reading-rooms in large numbers, and when tired of reading would amuse themselves with games. Mr. C. Wilson, manufacturer, Hawick, told the labor commissioner that his men had been using their leisure wisely, and had improved during the years they have now enjoyed it.

Mond & Co. state explicitly of a small reduction made in their works : "To the men it has been the greatest boon. It has had the most material effect in improving their health and decreasing the amount of drunkenness, which before the adoption of the system was very great indeed. The interference of the police is not called for now as it used to be." Messrs. Johnson of Stratford, after four years' experience of the eight-hour system, say that they have now a more intelligent set of men, and that the men and lads have come, in consequence of their greater leisure, to improve themselves by attending technical classes in the evening.

This is the universal testimony where the system has been tried for any length of time. Sometimes the *first* effect of a considerable reduction of hours is to somewhat increase drunkenness and debauchery. Men brought up under a long-hour day and accustomed to the standard of life that goes with it, sometimes use their first greater freedom for greater evil ; but soon the shorter hours produce a higher grade of life and a higher *morale*. The worst drinking and the worst morality always go with exhausting toil and no opportunity for the development of nobler life. In Switzerland it was claimed, when the hours of labor were shortened, that the hours gained from the mill would be given to the tavern ; but M. Blocher, a Swiss collar manufacturer, expressly says that this was not the case, and that it was when his men worked day and night that he saw most dissipation.

In Australia, the country which has gone farthest in reducing hours, the saloon interest is reported by Mr. Rae to have always opposed the reduction of hours. Writers like Mr. Bryce, and almost all who visit Australia, notice the neat cottages of the working classes in the suburbs almost invariably tilled by their owners, a fact which could not be if short hours meant much tipping. Mr. Rae says that the general opinion in Victoria is that the habits of the men have improved and not deteriorated through the short hours. In the United States, the testimony is conclusively the same. Firms which work their laborers short hours and treat them like human beings find that their men do more work and live far better lives than workmen reduced by long hours of toil to a condition little better than the brutes.

Massachusetts has been for some years a 10-hour State, and its labor commissioner instituted a special investigation in 1881, for the purpose of comparing results in the 10-hour mills of Massachusetts and the 11-hour mills of the neighboring States of New England. The conclusion he arrived at was this : "It is apparent that Massachusetts, with 10 hours, produces as much per man, or per loom, or per spindle, equal grades being considered, as other States with 11 and more hours, and also that wages here were as high, if not higher, than in States where the mills ran longer time."

IV. OBJECTIONS TO SHORT HOURS.

Some objections popularly raised to the short-hour movement have already been answered :

such as the claim that short hours increase drinking, etc. This has been shown by the evidence to be emphatically not the case.

An apparently better sustained objection is that manufacturers who can scarcely make a living now cannot afford to shorten their hours without also lowering their wages, and that this would both hurt the laborer and hurt the market by decreasing his purchasing power. The conclusive answer to this is that a reasonable and gradual reduction of hours has been proven over and over again not to have decreased production, while the eight-hour men claim that if it should lessen production it would raise the standard of living, make the employers employ more men, thus improve the market, and so enable the employers to pay higher wages. This latter point we shall discuss in a moment; concerning the first point, that shorter hours do not lessen production, the testimony is overwhelming.

Messrs. Webb and Cox's *The Eight-Hours' Day* says on this point:

"Seventy-five years ago men commonly worked 90 and 100 hours per week. By successive stages these hours have been brought down to 56%. At every stage it has been conclusively 'proved' by the manufacturers that the proposed new restriction of hours would deprive them of all margin of profit, would raise the price of the commodity, lower the wages of the workers, and destroy the export trade. Celebrated economists were found to demonstrate that the whole economic advantage of the running of the mill at all lay exclusively in the 'last hour,' and that its prohibition would involve, accordingly, the cessation of the industry. Yet the result has over and over again shown that manufacturers and theorists alike were wrong; the hours of work have been successively reduced, without diminution of production, fall of wages, rise of prices, or slackening of trade.

"During the debates on the ten-hours' bill it was usually taken for granted that wages would be diminished by it at least 16 per cent. Sir James Graham and Mr. Cardwell both assured the House of Commons that the fall would be 25 per cent. Mr. John Bright lent the weight of his practical experience to a similar assumption. And wages did occasionally fall off for a time. . . . But in 1859 Mr. Robert Baker, who had had a long experience as factory inspector, reported to the Social Science Association that 'altho the hours of work have been very much diminished, wages have increased in some cases 40 per cent., and generally about 12 per cent.,' and that this reduction of hours and increase of wages had 'not diminished any kind of textile production, and therefore it had not injured our national prosperity.' Nor has the gain been made at the expense of other industries. Political economists are emphatic in their conclusion that 'the effect of the Factory Acts has been undoubtedly to raise the real wages of the working classes as a whole.'

"Similar results have followed reductions of the hours of labor in other countries, and equally to the surprise of the political economists. The State of Massachusetts passed a ten-hour law in 1874, altho its textile industries were exposed to the competition not only of Lancashire, but also the immediately adjacent States, in which the hours were at that time entirely unrestricted. The manufacturers and the economists predicted ruin and starvation. Even after the event they persisted in the same prophecy, then simply converted into an assertion of the kinest fact. Mr. Edward Atkinson of Boston, the well-known advocate of unrestricted 'free trade,' even in labor, actually gave evidence before a committee of the Massachusetts legislature in 1880, as to the ten-hour law of 1874, that 'its operation was injurious to working men, as they had to work for one-eleventh less than similar laborers in other States.' The result was that the legislature directed the Bureau of Statistics of Labor to inquire whether this was the case. Mr. Carroll D. Wright gives in the 1881 report the elaborate statistical outcome of this inquiry, and thus summarizes the result: 'It is apparent that Massachusetts with 10 hours pro-

duces as much per man, or per loom, or per spindle, equal grades being considered, as other States with 11 and more hours; and also that wages here rule as high, if not higher, than in the States where the mills run longer time.' Wages in Massachusetts (tho the operatives work by the piece) not only did not fall, but steadily rose from an average of \$109.40 per annum in 1850, with about 70 hours' work per week, to one of \$238.19 in 1880, with 60 hours' work per week. Nor was the industry destroyed, or even diminished, relatively to the other States where no limitation of hours existed. In 1831 Massachusetts had invested in the cotton industry \$12,821,000, being slightly under one-half of the total for New England. In 1880 it had risen to \$72,291,601, and still bore almost exactly the same proportion to the whole. The result of this triumphant vindication of the economic advantages of a legal limitation of the hours of labor was that Rhode Island, New Hampshire, Maine, and Vermont, which had hitherto opposed the movement, now adopted the ten-hour law.'

A more plausible objection to reducing hours of labor is that it would put the country or State making the reduction at a disadvantage compared with those working long hours. This assertion, however, is again disproved by the facts. If shorter hours do not decrease production (as we have seen) and do increase the capability of the workers (as we have also seen) there can be no question that short-hour labor is in the long run by far the cheapest labor.

It has been proven over and over again (see Productivity) that the high paid American workman is the cheapest workman in the world and the English workman next. America is not afraid of the long-hours countries of Asia, but of the short-hour competition of England. Improved machinery is no sooner made in one country than it is imported or imitated in another; and as the material elements of the competition are growing equal, the supremacy must obviously go to the nation that can turn these elements to most account—the nation with the most vigorous, the most intelligent, the most productive working-class. . . . Is it any wonder to read in Dr. Gavernitz's book, *Der Gross-betrieb*, how the German manufacturers giving evidence at the commission of inquiry, one after another said they were confounded to find that the country where labor was really cheapest was the country where the wages were highest and the hours shortest; or to read in the letter of a German ironmaster to Sir I. L. Bell, explaining why he employed twice as many men for the same work as would be done in an English blast-furnace—'We have often the same technical appliances as you in England, for anything an engineer sees he can imitate and construct, but what we cannot imitate is to work with our cheaply fed men with the same vigor that your English workmen labor.'

In the United States it has been claimed repeatedly that one State could not afford to reduce the hours of labor unless all did, but the experience of Massachusetts (see above) and other States has always disproved this. In almost every case manufacturers have declared that their business would be ruined if their hours were shortened, yet when the hours have been shortened, wages have risen, production has not been permanently decreased, nor profits curtailed.

The last objection to the short-hour movement is by far the most important. It is not, however, an objection to the short-hour movement in itself, but to the position of the eight-hour philosophy, that the reduction of the hours of labor is a sufficient measure upon which to concentrate the labor movement at present. This objection is that reducing the hours of labor will not employ the unemployed, or at least will not employ them so fast as improvements in machinery, etc., will create more unemployed, and that, therefore, the short-hour movement is helpless to solve the most important economic problem of the present day. Those who use this argument against the exclusive eight-hour movement say:

"We welcome the reduction of hours as a portion, and as an indispensable portion of a labor program, but when it is made a substitute or even a temporary substitute for the whole socialist program, we consider it reactionary, and powerless to check the phenomena of so-called 'overproduction,' unemployment, and the breakdown of the whole present industrial system."

Socialist View.

The reason for this position is that the reduction of the hours of labor in the gradual way, which is alone practical, does not diminish the production of those employed, and therefore does not tend to call in the unemployed to do work formerly done in longer hours by those whose hours have been reduced. If this does occur in a few trades, as is not denied, and if the reduction of the hours of labor does raise the standard of living, and so to a degree increase demand, and so tend to employ a few of those formerly unemployed, this is overbalanced by the tendency of the reduction of hours to speed old machinery, introduce new, and make other improvements in production; thus discharging more men than the reduction of hours has given employment to. Such is the objection, and it is supported by many facts.

Says Mr. Rae, after most carefully studying the "unexpectedly copious" experience of England, Australia, and the United States, and being himself a convert to the reduction of hours (*Eight Hours for Work*, pp. 277-280): "The prevailing idea, that a uniform eight-hour day will abolish the unemployed, is of course chimerical. . . . It stands in absolute contradiction to our now very abundant experience of the real effects of shortening the hours of labor, and it stands in absolute contradiction to the natural operation of economic forces. . . . It is not in the nature or power of an eight-hour day to . . . make any serious impression on the number of the unemployed." Similarly says Palgrave's *Dictionary of Political Economy*, article *Eight-Hours Movement*, "as a matter of experience, the eight-hour day has surprisingly little effect on the numbers of the unemployed."

The Unemployed.

To this the eight-hour philosophy answers:

"(1) That the eight-hour movement does not propose to limit the reduction of hours simply to eight. If eight hours will not employ the unemployed, why then let us have seven, or six, or five, or four, which will employ the unemployed; (2) that a careful analysis of the various facts will show that the reduction of hours has employed the unemployed, as is proven by the fact that the population has increased in all civilized countries, especially in those countries where the short-hour day prevails, the number of the unemployed has not increased, and those who complain of hard times now forget the harder times of a generation or two ago."

But to this it is replied:

"As for the first point, that if eight hours do not employ the unemployed, the eight-hour philosophy proposes to reduce hours to seven, six, five, or four, and in this way employ the unemployed, this is a mere dodging of the question. The question is what is practical *now*; and none know better than the eight-hour men that to talk of reducing hours lower than eight is, except under the rarest circumstances, to-day utterly out of the question. After a half century of agitation, the average hours in the United States are yet well over 40, and only a small minority of the stronger unions have gained in some cities the eight-hour day. To talk then of lower hours is to mislead. The eight-hour philosophy itself claims that the reduction must be gradual. The question is whether to-day a reduction of the hours of labor *that is within the range of possibility* can employ the unemployed, and seven, six, or five hours are out of the range of possibility, save in the rarest instances.

"As for the second point, that the unemployed are on the whole not increasing, and that admittedly the shortening of the hours of labor is raising the level of

those enjoying its gains, and enabling them to demand higher wages and cope with further problems, it cannot be denied that progress for the working classes has been made, but it does not follow, in the first place, that this progress is due to the reduction of hours, and secondly the question still presses, whether in all civilized countries the labor question is not as a matter of fact more acute than ever, and whether even the problem of the unemployed is not, in numbers no more serious, in quality infinitely more serious. Statistics may prove a slightly larger proportion of the people to be engaged in gainful occupations, but this does not show how continuously those persons are employed; and beyond all possibility of denial, improved methods of production (partly occasioned by limiting the hours of labor) are enabling factories to turn out their products in less and less portions of the year; continually increasing the periods when operatives counted as having occupations are really out of work. In some occupations shorter hours may employ the unemployed. The eight-hour men are fond of referring to those who work on street-cars and on railroads, arguing that here at least it takes three men at eight hours to do in 24 hours what two men would do at 12. It is not denied that there are such instances, but even in such occupations the principle does not work as might be expected.

"A large number of railway employees, such as those engaged on repairs, or as clerks, laborers, etc., are employed in forms of labor where intensity of work can make up for long hours. Therefore even on railroads shorter hours will by no means create the demand for unemployed labor that some short-hour men claim. The truth is, that facts are showing that the compulsory or voluntary shortening of hours has immensely stimulated the speeding of old machinery and the introduction of new labor-saving devices, so that instead of employing more hands, fewer hands, or the same hands, have produced more goods, not less—far more than the short-hour men realize. According to Mr. Rae, in large engineering works, Messrs. S. H. Johnson & Company, of Stratford, London, reduced the hours of their works some five years ago from 54 to 48 a week, paying their hands the same day wages as before, and they get more work out now than they got then, without any increase whatever in the cost of production.

"So with Messrs. William Allan & Company, of Sunderland. It was on January 1, 1892, that this firm (of which Mr. W. Allan, M. P., is head) reduced their hours from 53 to 48 a week. Mr. Allan was himself surprised at the results he got. 'Paradoxical as it may seem, I get *fully more work* out than formerly; in fact, I am surprised at how the work is going ahead; having believed, like so many employers, that there would be a corresponding decrease in output. . . .

Of Australia, *Palgrave's Encyclopedia* says: "In Victoria, for example, where three-fourths of the population now work only eight hours a day, the unemployed are strangely enough a greater and more constant trouble than they are here, and, stranger still, they seem to have become even a greater trouble since the eight-hour day became general, a few years ago, than they were before."

Such is the universal experience. The eight-hour men try to explain it away by saying that often, when there has been a nominal reduction in hours, there has been an increase in overtime work, so that really, the wages have risen, there has been no diminution in hours, and therefore, of course, no diminution in production. Or they claim that the men, especially in the recent **Experience**, trials, were on "their good behavior."

Yet, allowing for all this, the fact remains that experience in England, Australia, and America, in all places and at all times, all points one way: the reducing of the hours of labor (within the limits of possibility) does not decrease production, nor increase the purchasing power of the community enough to balance the effect of machinery and improved methods in discharging laborers; so that the eight-hour philosophy breaks down at the vital point and does not reduce poverty, for the masses.

All this is, indeed, no argument against reducing hours. These facts only show that this reduction is not the one thing to concentrate attention upon. What other things should be done also, we are not here considering. (See UNEMPLOYMENT.) Different schools of thinkers will disagree as to what should be done. Individualists will call for the develop-

ment of individual education and capacity. Single-taxers say the one thing to do is to open natural opportunities for labor. Socialists deny that there is any one thing to do. In all countries they stand with the eight-hour men for reducing hours, but they add to this the demand that more and more the community control industry and replace competition by cooperation. They point out that, even to-day, the eight-hour men have found it easiest to gain the eight-hour day in government works, and that in England and all countries where there has been an expansion of municipalism, there has been also an expansion of employment under fair conditions. In England and New Zealand municipalism is nearing to-day the abolition of the contract system and the application of trade-union conditions to government works, thus bringing in the eight-hour day through socialism, and at the same time—by having the State do what otherwise would not be done—actually employing the unemployed.

(For instances of this, see articles **NEW ZEALAND**; **BIRMINGHAM**; **LONDON**; also, **STREET-CARS**.)

SIDGWICK, HENRY, was born at Skipton, Yorkshire, England, in 1838, and educated at Rugby and at Trinity College, Cambridge. He became a fellow and lecturer of his college in 1859, resigning his fellowship in 1869 on account of the conditions of religious belief then attached to fellowships. In 1870 he was active in establishing academic instruction for women in Cambridge. He was appointed professor prelector of moral philosophy in Trinity College in 1875, and Knightsbridge professor of moral philosophy in the University of Cambridge in 1883. He has contributed to periodical literature many articles on philosophical and economical subjects. In his philosophical works he seeks to reconcile lines of thought previously regarded as antagonistic; in ethics to reconcile intuitionism and utilitarianism. In political economy his endeavor has been to find the right compromise between, or combination of, the traditional deductive method of English political economy and the views of the men sometimes called Socialists of the Chair, predominant in Germany. His works include the *Methods of Ethics* (1874); the *Principles of Political Economy* (1883); *Outlines of the History of Ethics* (1886); *Elements of Politics* (1891).

SILVER. (For statistics and other information as to the history, production, supply, and use of silver, see **GOLD AND SILVER**; for the bimetallic position, see **BIMETALISM**; for a history of the silver question in the United States, see **CURRENCY**.) We give in this article a statement of the present silver situation in the United States as it appears to the supporters of silver coinage. (For the

arguments of those opposed, see **MONOMETALISM**.)

THE SILVER MOVEMENT.

The friends of the present silver movement in the United States are divided into several classes. There are, first, those who believe in bimetallism, and desire to see silver used as primary money in connection with gold, at some fixed value, but who believe that this can only be done safely with international agreement. Most of these are therefore opposed to the proposition for the United States to coin silver at a ratio of 16 to 1, without waiting for international agreement. This view includes the large majority of the professorial economists, such as President Walker (*q. v.*), and a large number of Republican and gold Democratic congressmen and political leaders, such as John Sherman and Secretary Carlisle, and others of both the two great parties. (For their position, except as to the very latest developments, see **BIMETALISM**.)

A second class of the friends of silver are bimetallists who believe that the United States can safely coin silver, without waiting for international agreement. In this class are a few professorial economists like Dr. Arendt of Germany and President Andrews (*q. v.*) of Brown University, and a large number of silver Republicans and Democrats.

A third class of the friends of silver are not so much bimetallists as believers in a carefully and scientifically regulated paper currency, who, holding that their ideal is not in practical politics, are willing to vote for free silver as a step toward a scientific paper currency. This view includes the mass of the Populist party and its sympathizers. Besides these three distinct classes there are, of course, those holding all kinds of combinations of views, and many who vote for free silver simply out of opposition to the gold policy identified in their minds with trusts, corporations, and plutocracy (*q. v.*).

In such a condition of affairs it is obvious that the arguments used by different persons for the coinage of silver are very diverse, as is true of the arguments used by various gold advocates. Nevertheless, the strength of the silver movement cannot be understood unless the arguments of these various views are remembered. We therefore give first the bimetallic argument for the free coinage of silver, by the United States alone, at a ratio of 16 to 1, without waiting for international agreement, and follow this by what may be called the radical view.

THE BIMETALLIC ARGUMENT.

This view bases itself first on the propositions that a contracting currency is hurtful to a nation; that a moderately and steadily expanding currency is beneficial; that for 20 years and over the United States has had virtually a contracting currency—*i. e.*, a currency not increasing in proportion to the demand for money to-day—and that therefore the country now needs an expanded currency.

To these propositions are added the propositions that one form in which a contracting

currency works evil is by lowering prices, while an expanding currency raises prices, and that the United States is suffering to-day from low prices, in part, at least, caused by a monetary contraction, which could be alleviated by the use of silver.

For a general discussion of these propositions, see CONTRACTION AND EXPANSION OF CURRENCY, but it should be noted here that as Mill stated in his day, and as President Walker has recently affirmed (address before the American Economic Association, December, 1895), no position in economics is more generally accepted than that a contracting currency does lower prices and cause depression, while the expansion of a currency, at least with a money commanding confidence (concerning which see below), is beneficial. Professor Marshall, perhaps the leading English economist, says (testimony before the Herschell Commission, No. 9629):

"I accept the common doctrine that prices generally rise, other things being equal, in proportion to the volume of the metals which are used as money."

This view was never even questioned by any leading economist writer until, as Dr. Spahr says, "the exigencies of the present silver controversy forced the monometalists to dispute it or retire from the field," while, as President Walker has reminded us, those who now argue that monetary contraction has little or no effect upon business were the foremost to assert the terrible effect of monetary expansion upon business. Nor does the proposition rest upon theory alone. History is full of illustrations of the principle. When on the discovery of the New World the supply of metals led to the coining of more money, prices notoriously rose. When, later, the Napoleonic wars led to the employment of paper as well as coin by both France and England, the value of both gold and silver fell one-half (Jevons' essay in the *Journal of the Statistical Society*, London, 1865) and doubled again when the paper was retired. When in the middle of the century the gold discoveries of California and Australia increased the supply of gold to some three times that of silver, the value of both gold and silver fell again. The rise of war prices in the United States is well known. Of recent experiences in the United States, Dr. C. B. Spahr says (*Review of Reviews*, September, 1896):

"In 1878, when the Bland-Allison bill was passed, requiring the coining of \$2,000,000 of silver bullion a month at the old ratio of 16 to 1, the monometalists with one accord predicted that we would have 'an eighty-cent dollar.' The value of the bullion in the Bland dollar had been below 80 cents. If the value of money depended on its material, and not upon its volume, the Bland dollar would certainly have been worth but 80 cents in gold. The cheaper dollar would undoubtedly have driven out the dearer dollar, and the monometalists' prediction that our gold would leave us would have been fulfilled. But these predictions have proven absolutely false. Despite the fact that the Bland dollar was not redeemable in gold, and that the banks for a time assumed a hostile attitude toward it, its value remains the same as gold, because it had the same money privileges, and its value was fixed like the value of gold by the supply and demand for money. About \$400,000,000 in silver coin was issued under this act, at the ratio of 16 to 1, and yet the whole of it remained at par. When the

Sherman act was passed the power of the government to affect the relative value of gold and silver was again shown. Not only was the price of all coin silver raised to the old level—\$1.29 an ounce—but the price of uncoined silver throughout the world was raised from a little over 90 cents an ounce to \$1.21. Yet the Sherman act had only increased our governmental demand for silver from \$24,000,000 worth a year to a little over \$50,000,000 worth. The relative value of silver only declined when Austria and Russia created a new demand for gold proportionately greater than the demand of the United States had created for silver. The recent fall in the value of silver and rise in the value of gold has been entirely due to governmental action, for the supply of gold from the mines has increased with far greater rapidity than the supply of silver. If the limited coining of silver under the Bland and Sherman acts was sufficient to raise all coined silver to \$1.29 an ounce and all uncoined silver to \$1.21 an ounce when the relative supply of silver was far greater than to-day, it is evident that unlimited coining and the doubling of our former demand would raise all silver to the old level."

Nor is it only that facts show an intimate connection between volume of currency and prices; and consequently between volume of currency and prosperity, but both the highest economic authority and facts show that the subject is one of the most serious and wide-reaching moment. President Walker wrote in 1894 (quoted in the *Bibliotheca Sacra*, April, 1896):

"To any political economist who regards the industrial structure as important, the steady shrinking of prices continued through a term of years, due to the increasing scarcity of the money supply, constitutes a tremendous force for evil. It is not alone that tens of thousands of millions of public, private, and corporate debts require a continually increasing amount of commodities to discharge the interest and principal of such obligations; it is not alone that the weight of the dead hand is continually growing heavier upon the living and active forces of the present; these are matters serious enough, but the greatest part of the evil of a diminishing money supply is wrought through the discouragement of legitimate profits, through the preference given to all investments of capital which result in a fixed charge upon production, over those which involve a participation in the gains or losses of active business."

Jevons bears this out, but President Andrews says (*An Honest Dollar*):

"Jevons, at any rate, is too moderate. After enormous admissions touching the ravages of changing currency values, he almost apologizes for the change in money value, on the ground that the sorrows springing from it are mostly occult, and that the people habitually refer them to other causes. The question is not whether the infelicities accompanying these monetary vicissitudes are appreciated or not, but whether they are real and serious. That they are both will be the conviction of every student in proportion to his acquaintance with them. . . . It is certain that none who have not made the subject a study at all adequately conceive the magnitude of the evil."

Nor is it only professorial economists who argue thus. Said Mr. Balfour, the English statesman (October 27, 1892):

"Of all conceivable systems of currency that system is assuredly the worst which gives you a standard steadily, continuously, indefinitely appreciating, and which by that very fact throws a burden upon every man of enterprise, upon every man who desires to promote the agricultural or the industrial resources of the country, and benefits no human being whatever but the owner of fixed debts in gold."

And surely the facts bear this out. The depressing effect upon American industry of the steady fall in prices for the last 30 years it is impossible to exaggerate.

The gold advocates usually meet this argu-

ment, not by denying the truth of the general theory as to the effects of a monetary contraction, but first by partly denying the fact of money contraction in the United States; secondly, by arguing that the fall of prices

(which they admit) is not due to currency changes; and thirdly, by asserting that tho a steady expansion of the currency by a money commanding public confidence might be well, silver does

not command such confidence (at least in lack of international agreement), and that, therefore, its monetization would produce evil and not good. (For these arguments in full, see MONOMETALISM.) To the first argument, that there has been no contraction of the currency in the United States, the silver bimetalists say that, on the above theory which all economists accept, the very fall of prices (and that they have fallen is not denied), forms a money contraction *relative to the demand for money*. What is the measure of demand for money? The amount of commodities men will give in exchange for it. If this has risen, as no one denies, it shows that the demand has risen more than the supply, or that there has been a contraction in money. It is true that the controller of the currency reports a per capita circulation in 1895 of \$22.96, and in 1870 of only \$17.50, but if one went back to 1865, he would find a circulation, even according to the controller, of \$22.16, while many publicists believe all these figures to really misrepresent the facts. The currency reports claim that all moneys ever coined by the United States and not withdrawn or used in the arts or entered for export, are still current. Such cannot be the case. That large amounts of gold are annually carried out of the country by travelers, etc., is well known; that much is lost is equally clear; that much gold is hoarded is still more certain. These processes—to speak of no others—going on year by year make the recent statements of the controller's reports absurdly misleading. Even the directors of the Mint admit this.

In his *Report on the Production of Gold and Silver* for 1888, p. 43, the director of the Mint uses these words:

"In years past we have often insisted that there must be an error in the item, because the most industrious inquiry failed to bring to light a very considerable portion of it. At present there are at least \$275,000,000 of the total [gold coin] that cannot be accounted for."

The method of estimating the outstanding silver is described by the director of the Mint in his *Report* for 1893, p. 166, as follows:

"The coinage of silver dollars since March 1, 1878, and the subsidiary silver coinage since 1873, at which date the estimated amount was \$5,000,000, together with the annual gain or loss by coinage or import—after an annual deduction of \$200,000 for use in the industrial arts—is taken as the estimated stock of silver coin in the United States."

A new estimate of the amount of gold and silver used in the arts was made in 1893, and beginning with that year \$1,500,000 is allowed for gold, instead of \$3,500,000 as formerly,

and \$100,000 is allowed for silver, instead of \$200,000.

The paper currency of the country is estimated by subtracting from the total amount issued the amount redeemed and destroyed by the Government. No allowance is made for paper money destroyed by fire and other means, with the exception of \$1,000,000 in United States notes estimated to have been destroyed in the Chicago fire.

On account of these facts the figures of the Treasury as to circulation have been frequently questioned. In a speech delivered at Fayette, Mo., October 12, 1895, Senator George G. Vest made an analysis of the figures for 1893, which according to government reports show a total circulation outside the Treasury of \$1,596,701,245 in money of all kinds, or an average of \$23.89 per capita.

"He first scales down the amount of money outside the Treasury to \$1,399,101,335, which is \$197,599,910 less than the official figures. He next deducts \$13,900,000 national bank reserves held by the 3781 banks on October 3, 1893, leaving \$885,201,335. From the \$3,079,462,683 deposits in 5685 State, savings, private banks, and loan and trust companies, on July 12, 1893, he estimates reserves amounting to 10 per cent., or \$307,946,268, which he deducts from the \$885,000,000, leaving \$578,245,067. He further estimates that \$250,000,000 in gold has been lost since 1873, of which the Treasury officials have made no account. This leaves \$328,245,067. Other deductions are \$20,000,000 for lost silver dollars and fractional silver; 10 per cent. on United States notes (\$34,668,101); the same per cent. on bank-notes (\$20,870,118); 1 per cent. on Treasury notes of 1890 (\$1,463,414); thus leaving only \$252,692,214. This, divided among a population which he estimates at 68,834,475 (10 per cent. advance on 1890), is \$3.67 per capita. If the \$197,599,910, probably deducted twice, on account of gold and silver bullion in the Treasury, were added, this would give \$450,202,124, which at Senator Vest's estimated population gives an average of \$6.54 per capita as the total money he estimates to be actually in circulation among the people in 1893."

As for the assertion often made by the gold advocates that even if the amount of legal-tender money has been contracted, bank and credit paper more than takes its place, it can be proved, in the first place, that the amount of paper passing through an institution like the New York Clearing-House has fallen off; second, the crowding of people in cities, where they are unknown to one another, has decreased trusting; third, the development of local transit, and of the intricacy of production and of life, has materially increased the demand for currency. (See CONTRACTION AND EXPANSION OF CURRENCY.) Again, even if the use of credit paper of one kind or another does supplement the use of gold, nevertheless all this paper must be measured by and rest upon a gold basis, if gold be the only legal tender. In ordinary times when confidence is general this may not be an evil, but let a crisis come, and then just when the most money is needed, then the money is contracted to its gold basis and fearful panic produced. This is among the worst results of monetary contraction.

It is the supposed necessity of keeping up our gold reserve which has led to the recent bond issues and syndicate contracts (*g. v.*) which have saddled the country with millions of debt. It was, the silver advocates claim, the dependence on a gold basis which pro-

duced the money panic of 1893. A steady fall of prices was caused by the contraction of money, through the strengthening of the gold reserves of France and Russia, the adoption of the gold standard by Austria; the panic in Australia, compelling investors to sell even American securities, and so withdraw gold from this country. Finally this was turned into a panic by India's sudden suspension of the free coinage of silver. Under such circumstances, to say that the panic was caused by a lack of confidence due to the Sherman act passed two years before, as the gold advocates assert, shows the weakness of their argument.

The worst aspect too, of this form of gold contraction, with gold as the basis of paper, is that it can be used by the gold interest to make matters still worse. Dr. C. B. Spahr, in *The Outlook* for April 14, 1894, says this is just what the Administration did in the gold interest. He says, speaking of the crisis of 1893:

"At such junctures in England the Government sets aside the Bank Act and allays the panic by increasing the currency. At such junctures in Germany the National Bank is by law authorized to increase the currency. At this juncture in the United States the President, elected on a platform pledging more currency, called Congress together to cut off even such increase as the existing law provided.

"Congress assembled, and the President submitted his message. The collapse of credit which made men unwilling to buy goods on credit, the anxious to sell them, and the fall in price of everything except money, President Cleveland attributed in so many words to the fear of a depreciated currency. This imaginary fear he attributed to the \$50,000,000 a year of currency issued under the Sherman act, tho under this act no one could get a dollar of currency without depositing a gold dollar's worth of silver bullion. Despite the fact that our country has needed for fifteen years \$60,000,000 a year increase to its currency, while the gold-mines supply the whole world with less than \$30,000,000 a year available for currency, he nevertheless demanded that the United States should stop using silver and join in the international demand for gold.

"In administering the Sherman law the Administration showed the same ignorance of the principles governing the value of currency, and the same determination to carry into execution the demands of the creditor classes which are enriched by the scarcity and dearth of money. When the question came before the Secretary of the Treasury whether the Sherman act notes should be paid in silver or gold, it was ordered that they be paid in gold at the option of the holder. President Cleveland, in his message to Congress, claimed that this interpretation of the Sherman act was necessary because this act declared it to be 'the established policy of the United States to maintain the two metals on a parity with each other.' He maintained that if the Government used its discretion to redeem these notes in the silver reserved against them, it 'would necessarily result in their discredit and depreciation.' This he urged despite the patent fact that the four hundred millions of silver certificates and silver dollars issued under the Bland-Allison act of 1878 had never been redeemable in gold, yet always were at par. These same silver certificates, a month after the message was written, among the New York bankers who were decrying them, actually commanded a premium of one per cent. over gold."

As for the assertion of the gold advocates that, tho there has been a fall of prices, this has not been due to the contraction of the currency, but to improvements in the methods of production, etc., it is to be said, in the first place, that even granting the assertion, it does not change the fact that prices have fallen, that falling prices have produced long-continued and disastrous depression in business. Nor does

it affect the argument that an increase of currency would raise prices and stimulate industry. Admitting all that the gold advocates say (see MONOMETALISM) as to the cause of the fall of prices, the fact still stares us in the face that gold has terribly appreciated in general purchasing power, and this gold monometalists have to admit.

Mr. Giffin (*The Case Against Bimetalsm*) gives up the argument that gold has not appreciated, and rests his case on the lack of confidence in silver (which argument we consider later). He says:

"We see, then, how widely those monometalists have been in fault who, in their dislike of bimetalsm, have denied that the recent great demands for gold in proportion to its supply were likely to have caused a rise in its exchange value for other things. Looked at in this way the fall of prices is itself a proof that gold, in relation to all the demands for it, has been relatively scarcer than it was. . . . The entire habits and customs of the people as to the use of gold and silver must be changed if gold is to be made abundant and prices are to rise. It was *this* answer which should have been made to the bimetalsm instead of a denial being given to the fact staring every one in the face that money, in the sense of the standard monetary substance, gold, is relatively scarcer than it was."

Secondly, bimetalsm cannot admit that the fall of prices has not been due to monetary contraction, *i. e.*, a contraction in proportion to the demand. That improvements in methods of production and transportation have affected the *relative* price of the commodities produced is not denied, but that has little to do with the question. There has been a general fall in prices which cannot be explained by improvements in production, etc., and can be explained by monetary contraction. This is shown by the fact that, generally speaking, the progress of invention has been steady, while the fall in prices has not been steady, but *has almost exactly followed the expansion or contraction of the currency*. As one may easily see by looking at the authoritative tables of prices, given under article Prices, there was a great decline from 1840 to 1849, exactly when money was growing scarce relative to the expansion of commerce. From 1850 to 1857 production went on expanding no more than before, but prices rose because the gold of Australia and California increased the supply of money. When this expansion of money was over, prices fell. During the Civil War money again expanded, and again prices rose. When, after the war, contraction of money took place, prices fell, though they rose again from 1860 to 1872, when money expanded. In 1873, when silver was nominally demonetized in the United States and practically in many European countries, we have a marked fall of prices, continuing till 1878, when silver was partly monetized and prices rose somewhat. They gradually fell again as money grew scarce, rose a little with the Sherman act of 1890, and later fell with the world-wide demonetization of silver. In view of these facts, supported by the best authority, to say that prices have not fallen because of monetary contraction is to deny all recent experience. We have thus all reputable economists unanimously agreeing down to the present time that prices do vary with monetary quantity;

Cause of Fall of Prices.

we have those who deny it now, admitting it formerly when it was a case of expanding currency; we have gold monometalists admitting that prices have fallen; we have the fact that money has been contracted in proportion to demand; we have general prices exactly following monetary variations and not following the—generally speaking—steady progress of invention. The case cannot be clearer that prices, however relatively affected by variations in supply and demand, have fallen because of monetary contraction and not because of the pessimistic theory that the progress of the world has caused the depression of industry.

We now come to the remaining citadel of the gold monometalists, that tho there has been a monetary contraction, and tho an expansion of currency is needed, nevertheless silver has become so cheapened in production and so discarded by the world that it cannot be safely used as stand-

**Objections
Answered.**

ard money, and certainly not without international agreement. Silver is worth to-day, gold monometalists point out, only 53 cents on the dollar, its production has increased 300 per cent. on the average production of 1861 to 1873, and there is no prospect of a reduction, but rather, if it be monetized, of a stimulated production, with little increased demand for it. The gold advocates further point out that silver has fallen, even tho under the Bland act the United States coined \$4,000,000,000 of silver, and under the Sherman act purchased 4,500,000 ounces per month. They argue that if this could not prevent the fall of silver, even when many countries were still coining it, the action of the United States alone can certainly not prevent its falling now, when virtually all the civilized countries of the world have been compelled to demonetize it. They argue that the demonetization of silver was not the cause of its fall in price but the result. They urge that to attempt to keep so cheap a metal at a parity with gold can but end disastrously and plunge the United States into all the evils of a depreciated currency. They argue that to coin silver worth only 50 cents into a legal dollar must drive out gold, put the United States on a par with the semi-civilized silver-using nations of the world, rob the working men by paying them in dollars worth only 50 cents, divide by one-half the \$1,739,000,000 in American savings-banks, the \$5,566,000,000 in life-insurance companies, the \$7,482,000,000 in assessment companies, etc., etc.

To this argument the silver adherents say it is true to-day that silver is worth only 50 cents, but that it is no wonder that this is so, when since 1871 all the civilized countries of the world have, one after another, stopped using it as primary money. Silver, they urge, did not begin to fall till the nations began to demonetize it. The partial monetization and purchase of silver by the United States did not prevent the fall, they argue, simply because it was more than overbalanced by the demonetization of silver in other countries. An international agreement to mon-

etize silver all silver advocates would welcome, but for 20 years the United States has been striving to get this without success. Those bimetalists who believe in the United States now acting without waiting for international agreement argue that if the United States does decide to coin silver, other countries will soon agree to do so, or if they do not will soon be compelled to do so. The fact is that a gold monometalism cannot be long sustained, because it is producing such depression that even wealthy countries like England will have to yield or have no further markets for investments. The reasons why England has hitherto favored gold are patent, but it is also patent that England may so ruin other countries as to hurt herself and ruin her own investments unless prices rise. There is a change in England. July 1, 1893, the *London Statist* said:

"The new policy of the Indian Government is likely to intensify the appreciation of gold. . . . If it does, then we have to look forward to a further fall in prices, to frequent fluctuations in the value of money, and to occasional severe spasms in the money market. If the Indian Government succeeds, silver, in fact, ceases to be a precious metal, and gold in the future will alone have to supply all the monetary demands of the civilized world. It follows necessarily that the value of gold must steadily rise, unless, indeed, new mines are discovered and the production is immensely increased.

"One consequence of the further appreciation of gold will be to intensify the agricultural depression all over Europe. Most of the charges on land have been fixed heretofore; they will weigh more and more heavily upon the land-owners as gold rises in value—in other words, as prices decline. So, again, rents will become more onerous, and it will be found that the settlement of the last few years was only provisional, and that a further reduction will become necessary. Also, it is evident that the burden of debt, not only upon individuals but upon governments, will be much increased. Countries like France, with an enormous debt, will feel the pinch, tho France is so rich and her people so thrifty that she will be able to bear the trial. The poorer countries will see their difficulties immensely increased, and unless they fall back upon silver the number of bankrupt governments will almost certainly increase. Spain, for example, is almost bankrupt already, but her difficulties will be increased as the burden of her gold debt is augmented. It will be hardly possible for Portugal to conclude a satisfactory settlement with her bondholders. The troubles of Greece will be added to, and the trials of Italy will likewise be multiplied. Everywhere the burden of debt will necessitate increased taxation, and so will weigh very heavily upon the general population."

As late as January 19, 1895, the *Statist* said further:

"The producing countries have been plunged into so much distress that they are compelled to sell at whatever price they can get, and our people are so well off that they are able to buy larger and larger quantities every year. The first consequence of this is that the working classes are exceedingly prosperous, and the foundation is being laid, in the second place, for a great increase in our trade, because merchants are laying in stocks of raw materials at exceptionally low prices. It may be objected that we lost heavily on our exports; but that is not really so. As was pointed out last week, there was a shrinkage in the actual volume of our trade. The United Kingdom has the labor, the machinery, and the capital to supply all the rest of the world with any quantity of goods it may require; but our foreign customers were too poor to buy from us on the usual scale. The exports merely confirm what the imports tell us—that the producing countries are in deep distress, and that we are growing in wealth. Of the total shrinkage in the value of our exports of £47,000,000, £17,000,000 is due to a decrease in quantity, and £30,000,000 to a decline in prices. Roughly, the decline in prices in the exports is half the decline in prices in the imports; or, to put

it differently, we gained twice as much by buying our imports cheap as we lost, even supposing there was a loss, in selling our exports also cheap. But, as a matter of fact, the loss must have been trifling, if there was any loss. This country manufactures cheap goods for all parts of the world; and cheap coarse stuffs include in their value not very much labor; the chief item is the raw material. But in buying the raw material we gained immensely, and, consequently, there was no need for very much reduction in wages."

This seems very satisfactory to English investors, but the fact is that it has been so successful that English investors can now find few countries prosperous enough to invest in and are crying out that something must be done. The English financial papers are full of complaints of this kind; interest is falling and markets failing. Investments of \$1000, formerly paying \$600 per year, do not now bring in \$400. Even the largest moneyed men realize that gold monometalism cannot prosper on the ruin of the producing countries. As long ago as the monetary crisis of 1892, Mr. de Rothschild said:

"If this conference were to break up without arriving at any definite result there would be a depreciation in the value of that commodity [silver] which it would be frightful to contemplate, and out of which a monetary panic would ensue, the far-spreading consequences of which it would be impossible to foretell."

The conference did come to no definite conclusion, a depreciation of silver did occur, frightful depression did result, and the consequences are not yet seen.

Dr. Otto Arendt said in the *New York Journal* of August 22, 1896, concerning the effect upon Europe, if the United States should declare for free silver:

"Bryan's victory will no doubt prepare the way for an international agreement. Should Bryan be elected, we, the bimetalists, would gain formidable allies, while American bankers would certainly do all in their power to forestall the depreciation of American values by backing our cause of international bimetalism."

"Now, as to the prospects in Europe. The possessors of American values, fearing depreciation, would influence the Bourse to such an extent as to cause capital to reconsider its attitude toward bimetalism, whereupon the European governments may be obliged to adopt bimetalism in order to restore confidence and equality."

"All Europe has formally declared that bimetalism shall not be introduced without Britain's cooperation. The English cabinet at Balfour's instigation decided, on March 17, that nothing should interfere with the gold standard. Balfour represents the remarkable and questionable view that no change of coinage should be imposed on financial men. In other words, the world of finance rules—the thief is jailer."

"Balfour waits and hopes patiently for the bimetallic conversion of London. That famous debate of March 17 has clearly shown what is thought of the question in the City. The Shylock standpoint was never presented with more brutal effrontery than by Harcourt. The American silver party will find Harcourt's speech the best campaign document. A producer who reads this speech, and does not vote for Bryan, cuts his own throat. In order to prevent some of this moral suicide, I quote a few characteristic phrases. Said the leader of the English Liberals:

"England has been called the land of Shylocks. Nobody who was present will forget the memorable speech delivered by Mr. Gladstone in this House on this same question, in which he submitted to the world's ridicule the proposition that this land of money-lenders should go from country to country, hat in hand, begging that we should be paid ten shillings for a pound. This is practically the goal to which bimetalism would lead us. [Hear, hear!] Of course, we are told that we shall receive more money. The truth is that we are paid not in gold, but in goods. It is out of this merchandise that our people make

their living, and now it is expected of us that we shall go around the world begging that we shall receive less merchandise for our gold. Can anything more ridiculous be suggested? [Hear, hear!] We, who have lent hundreds, nay thousands of millions to foreign nations, shall ask them that for this money they shall give us less in return than we now receive. [Hear!]

"With this speech Shylock Harcourt has laid bare the kernel of the whole matter. Shall producers pay double value in goods or not? The English creditor grows rich, while his American victim goes to ruin. When once it becomes fully understood in London that Bryan is bound to enact the free-silver coinage, without the permission of the Stock Exchange, will not the fear of the decrease of American values bring about the City's conversion? Then Balfour will follow his bimetallic convictions, and in that case all Europe is conquered."

"It is self-evident that the American people desire to be as independent of the manipulators of the bourses of New York and Chicago as they must be absolutely free of the conditions that govern speculation in Berlin and London. So-called silver fanaticism, of which we hear so much, is really but a protest against shady bourse manipulations that threaten the small man, year in and year out."

"The American silver party, if it means to do its full duty, must not be content to break the gold monopoly, but must also put an end to the fluctuations of the value of silver. This should be accomplished as follows: Immediately after Bryan assumes his office, the Government of the United States should ask the powers of Europe whether they desire a mutual understanding with reference to free coinage. The powers will not be long in formulating requests and submitting propositions, by whose adoption all contracting parties will gain. Thus it may come about that international bimetalism and the best possible solution of the financial and economical problems of the day will be the ultimate results of Bryan's and the people's victory."

This is the view of others than Dr. Arendt. These men hold that, having waited 20 years in vain for international agreement, the wiser hope now is for the United States to force the situation. It may for a while throw this country out of financial touch with Europe, but that it will wholly prevent international trade is absurd. Suppose the United States be on a silver basis and Europe on a gold basis. America can still buy, at the worst, gold at some price to effect international exchanges, while, if prices rise here, American producers will gain more than enough to make up for considerable inconvenience, and even loss, in international exchanges. The price of the main agricultural exports will not be affected at all, since they are dependent on English and not American markets, so that our main international exchanges will not suffer. On the other hand, if gold monometalism continue, depression and contraction must not only go on, but be intensified, because the gold advocates propose, and indeed will be compelled, to destroy all paper, which is now made use of to draw gold from the treasury. Any temporary losses which may result therefore from international exchanges are nothing to the suffering that must result from a continuance of the gold monometalism. Nor do the silver bimetalists admit that silver will lack confidence. They say that to-day its fall in price is patently due to its world-wide demonetization (*e. g.*, when India closed her mints to its free coinage, silver fell 5 per cent.). When the United States commences free coinage, not as before coining a limited amount, but agreeing to take all that can be produced, it must rise in value, while many believe it will be on a par with gold.

Says Dr. C. B. Spahr in one of the articles quoted above :

"Nothing is clearer historically than that the value of money depends not upon its material but upon the relation between its supply and the demand of business. My own lingering doubts upon this point were removed by the experience of France immediately after the gold discoveries.

"It will be recalled that the production of gold within a few years increased tenfold, while the production of silver merely increased at the steady rate it has maintained for the century. The cost of mining gold, measured in days' labor, was reduced to less than one-half. Had gold been demonetized, as the monometalists then demanded, its value would doubtless have fallen as rapidly as they predicted. But as the mints remained open, and an ounce of gold still retained the same currency privileges as $15\frac{1}{2}$ ounces of silver, its value could not fall any faster than the value of all currency fell. For several years, France, with less than half of our present population and hardly more than half of our present currency, received yearly at her mints \$100,000,000 of gold. Yet with this expansion of the currency came an expansion of business, demanding more currency. Prices rose but one-fifth in 15 years, and prices in silver rose as rapidly as prices in gold. There was a slight premium upon silver at the bullion dealers', where a little silver was each year sought for export, but this premium did not exist in ordinary transactions. Just what took place is admirably described by Chevalier in a passage that cannot be quoted too often.

Value of Silver.

Writing in 1859—11 years after the flood of cheap gold had begun to pour into the currency—the great monometalist of his generation said :

"One is surprised at first that a production of gold so vast, so colossal as has been noted, in comparison with what had been seen before, has not yet caused a lower ratio of gold to the other precious metal. But there is intervening a powerful cause which temporarily holds back gold in its fall. France offers thus far an indefinitely great market upon the basis of 1 kilogram of gold for $15\frac{1}{2}$ of silver. For the stranger who owes a Frenchman a certain number of francs—that is a certain number of times $4\frac{1}{2}$ grams of silver—acquires himself legally by giving him a quantity of gold $15\frac{1}{2}$ times as small. Whenever the merchant in precious metals wishes to exchange his gold for silver, he obtains almost the same terms; for, in addition to the quantity indicated by the ratio of $15\frac{1}{2}$ to 1, he has only to pay the premium, and by force up to this present that has been slight, and must remain so for some time yet, for a reason easy to perceive. So long as there remains much silver in France, people residing there, to whom the pieces of metal come, ought to esteem themselves happy to exchange it for gold at a premium very small over the ratio established by the law of 1803, since for the payments they have to make they cannot make their creditors take it for more than the proportion of gold indicated by the law, 1 to $15\frac{1}{2}$. For the same reason it will be impossible at London, at Brussels and Hamburg, at New York, or any other place on the general market, for gold to be worth much less than $15\frac{1}{2}$ its weight in silver."

"What took place in France in the fifties, when the free coinage of gold was continued despite the protests of the classes favoring a scarce currency, is likely to take place in the United States when the free coinage of silver is resumed, despite the protests of the same classes. The increase in our currency will be relatively less, and the rise in prices probably less. To-day the entire annual product of the silver-mines of the world (reckoned at its old price) is but a little more than \$200,000,000. Nearly one-half of this product, as Mr. Giffin said in his *Case against Bimetallism*, is taken for non-monetary purposes (including the consumption of India). Further, millions are taken for the subsidiary currency of gold-standard countries, and the entire currency of silver-standard countries. These demands are not lessened when silver rises in price. The amount of silver that can be brought to our mints is not likely to exceed \$200,000,000, even if the cause of bimetallism is too weak abroad to lead any other nation to follow our example. The relaxing of our demand for gold is likely to lower the value of that metal to where it stood prior to the adoption of international monometallism in 1803. With prices restored to the level of four or five years ago, \$100,000,000 a year is hardly more than sufficient to maintain prices upon that level. During the decade between 1880 and 1890 our currency, according

to the official estimate, increased nearly 5 per cent. a year. The estimate was somewhat exaggerated, but the real increase was about 4 per cent., and this was insufficient to prevent slowly falling prices. One hundred million dollars a year added to our currency would increase its volume but 7 per cent. a year, and would hardly keep pace with the demands of expanding business. . . .

"When the currency demands for the two metals were approximately the same, silver and gold remained at the old ratio during the first part of the century, tho three times as much silver was produced as gold; they remained at this ratio at the middle of this century, when three times as much gold was produced as silver. Much more, therefore, will equal currency demands maintain this ratio at the end of the century, when the two metals are produced in equal amounts."

Nor is there any danger of a flood of silver. Silver cannot be produced fast enough, or be brought to this country in quantities enough, to raise the circulation above the demand for money. Even gold advocates admit this. Secretary Carlisle's argument is that the free coinage of silver will contract the currency, because the gold will go and there is not enough silver to take its place. In his widely quoted speech before the working men of Chicago, April 15, 1896, he argued that if the United States mints devoted themselves wholly to coining silver it would take 15 years to coin enough silver to replace the gold that would be driven out. But silver advocates are not afraid of contraction on this score, because they show that gold is practically out of circulation now, so that what new silver would be coined would be a gain. To talk, therefore, about "a 50-cent dollar," "dishonesty," and "loss to working men and savings-bank investors," etc., is absurd, because it argues, from the value of silver when demonetized, the value of silver under free coinage; a wholly different matter. The gold advocates sometimes reply, "If this be so, if the silver dollar be worth a gold dollar, what will it advantage the oppressed debtors and farmers of whom the silver advocates make so much?" The answer is very simple. A silver dollar will be worth a dollar of gold, but prices will rise—measured in either silver or gold—because of the increased quantity of money, and so producers be able to pay off their debts the more easily in perfectly honest money."

But will this not hurt all wage-workers and all receivers of fixed incomes? Not if it benefit the whole country. To-day the wage-workers are suffering far more from non-employment and short time than from low wages. If prices rise, and for a while rise more than wages, wages will follow in time, while meanwhile the workers will gain far more than they lose in the stimulation of industry and the loosening of the wheels of commerce, to-day under paralysis. Some silver bimetallists admit that a temporary panic may be produced, if free silver be adopted, owing to the fear of free silver on the part of the moneyed classes; but they urge that it will be but temporary, while, if it does not come now, it must come later in intensified form, whenever the step to free silver be made. The step, they say, must be taken some time, because the world simply

cannot go on, on the ruin of the producing classes due to gold contraction.

But supposing silver should not rise to a full 16 to 1 valuation to gold, bimetalists even then believe in its monetization. Suppose the silver dollar falls to 85 per cent. of the present value of a gold dollar, even so it will but bring back prices to where they were in 1893. Since 1893, according to Sauerbeck's tables, which are considered of the highest authority, prices have fallen over 15 per cent., so that if creditors are paid in dollars depreciated 15 per cent. these dollars will still be as valuable as gold dollars were in 1893. Loans contracted before 1893 will be paid back in money worth more than the money lent, and the loans made since 1893 are a minority of the debts. A few creditors may thus be wronged, yet not even they dishonestly, for they loaned with a full understanding that currency might change, while the large proportion of creditors would get more value than they loaned. The following are Sauerbeck's indexed figures from 1890 :

1890.....	72	January, 1896....	61.4
1891.....	72	February.....	61.4
1892.....	68	March.....	60.7
1893.....	68	April.....	60.3
1894.....	63	May.....	60.1
1885.....	62	June.....	59.3

Thus the bimetalists believe that, with perfect equity, with a minimum of monetary disturbance, with the probability of forcing international agreement, the United States can adopt the free coinage of silver at a ratio of 16 to 1 without waiting for international agreement, and thus save the country from the commercial ruin, the industrial prostration, the subserviency to the money power of Europe and America, the infamous bond issues and syndicate contracts, the increase of indebtedness that have long rested like a miasma on the land. Says President Andrews, in a published letter under date of July 14, 1896 :

"After a possible first shock our credit would improve after free coinage. It is our present course which must speedily lower our credit. How long could a man or a firm continue to have credit who borrowed each year to pay a large portion of his running expenses? Yet on a gold basis this course is inevitable, and that is at this moment the reason why foreign lenders are shy of our securities. There must be a change if we would avoid bankruptcy. With free coinage every industry would look up, and even if we lost our gold, our prosperity would invite in English capital just as Japan's prosperity now causes it to rush there.

"Never since slavery days has the press in the parts of the country familiar to me displayed such disregard for truth and such stubborn obtuseness to the most obvious considerations as it does at present on the silver question. This means that the money power seated in London, but with representatives in New York, Philadelphia, and Chicago, is determined to continue the appreciation of gold, and determined, therefore, that the fact shall not be known. The bankers and the press are almost entirely under its influence.

"I think the money question at the present time the great question of civilization."

THE RADICAL VIEW.

The Radical view on the silver question is quite different from the bimetallic view. It may accept the bimetallic analysis of the

present situation, but it bases its support of silver on quite other grounds. It is essentially a Greenback party and not a bimetallic party. Mr. Henry D. Lloyd, describing the Populist convention of 1896 at St. Louis, says (*Review of Reviews*, September, 1896):

"The members of the People's Party have had most of their education on the money question from the Greenbackers among them. . . . The People's Party believes really in a currency redeemable in all the products of human labor, and not in gold alone, nor in gold and silver."

The People's Party accepts silver at best as but a stepping-stone to further currency reforms, while many of the party question whether it is much of a step. It is not that the People's Party wants more money, no matter how gained. It knows very clearly what kind of money it wants. Probably no body of men in the world are better educated on the money question than those who represent recent Greenbackism. They have had 30 years of discussion of it. They have no loose ideas about inflation; they know perfectly well the evils of overissue; but they also know perfectly well the evils of underissue. What they want is a paper currency, carefully restricted and regulated on scientific principles according to the multiple standard (*q. v.*) or some such system. This view, it must be remembered, has the support of almost all of even the most cautious economists, with the single tho important exception that most economists, believe the people cannot be trusted to conduct such a currency within safe limits, and that a currency not kept within such limits would be the worst kind of money. The point of difference between scientific Greenbackers and conservative economists is simply then how far the nation can be trusted to regulate a paper currency. But however this be, the Populist Party, recognizing that the majority of the nation could not be got to favor paper money, is willing, or at least a majority of the party is willing, to accept silver money as a step in that direction. (For the argument for paper money, see PAPER MONEY; also MULTIPLE STANDARD.) The party is willing to compromise on silver simply because it believes that no advance can be made in America till the power of the money monopoly be broken. It supports silver, therefore, mainly to defeat gold.

Scientific Currency.

Says Mr. Lloyd (speaking of the St. Louis convention, *idem*):

"The strongest single body of believers in the convention was this of anti-monopoly in everything, including the currency. These men would rather have declared for the demonetization of gold than the remonetization of silver. . . . But those who might have called this force into activity were quiescent. . . . The fear ruled that unless the reform forces united this time they would never have the opportunity to unite. It was in the air that there must be union."

The reason for this desire for union must be found in the bitterness and intensity of the hatred of the money power of the United States. It was not a new feeling. It is the result of 30 years of agitation against the gold power, beginning with the struggles over the

greenbacks (*q. v.*) in war time. This element cannot be dissociated from the present situation, without utterly misunderstanding the situation. The silver movement is not a passing craze. Says the *American Review of Reviews* (August, 1896) of the Democratic convention which declared for free silver:

"They were self-respecting American citizens who detest anarchy, abhor repudiation, and occupy their present attitude with the clearest conscience and strongest conviction that have guided their political action at any time since the war.

"The moral superiority in the convention did not lie with the masterful politicians of the Hill and Whitney type, who went to Chicago with the impression that they might, through long experience in convention management, divide the ranks of the free-silver majority and secure a compromise result. Against the earnestness, openness, and almost fanatical intensity of the free-silver majority, the calculating politicians were simply helpless."

It is not inconsistent with the fact of this moral earnestness that many Populist leaders have been led into exaggeration and mistake as to facts. Such is their assertion as to the so-called "crime of 1873." It can be proved (see MONOMETALISM) that there was no conspiracy or concealment on the part at least of most of those who prepared and voted for the famous act of that year, nominally demonetizing a metal which had been practically demonetized nearly 40 years. It is also evident to most thinkers that Populist speakers and writers are mistaken when they refer, in the literal sense of the word, to any *conspiracy* at any time by the gold influence of England or Wall Street. There is no remotest proof of

Conspiracy?

such a conspiracy. The much discussed story about the coming of Ernest Seyd to this country as the representative of the gold power, to obtain the passage of the bill of 1873, is a myth. Nevertheless, the Populists who talk of a conspiracy are not so wrong as at first appears. Literally, they are wrong; there has been no conspiracy, but perhaps, only because there has been no need of one. In no civilized country (except occasionally in the United States) has the financial policy of that country been directed by the masses of its people. In every country (and including the United States, except on a few occasions) the financial policy of the country has been directed by the class engaged in the business of handling or loaning money. Especially has this been the case in England. Now the perfectly avowed and natural interest of this class has been, for the last 30 years in all countries, and for the last 80 years in England, to favor gold. Its members have, therefore, perfectly honestly and usually openly, worked for the demonetization of everything except gold. They may have issued private circulars and written private letters and they probably have, but this was their right, since perhaps 90 per cent. of this class have honestly believed that their views were for the real good of all, and since this view can be, to say the least, strongly defended (see MONOMETALISM). There has been therefore no conspiracy nor need of one. And yet this whole class, to a greater or less degree, does agree together to oppose all forms of currency expansion and

recently the use of anything as standard money but gold. The effect of this upon the world is well known.

The effects of gold appreciation upon the prosperity of a country have never been more strongly felt by any Populist than by some of the sober economists quoted above. Yet steadily, from 1863 to 1896, the moneyed class time after time have prevailed upon Congress to enact a bill now partly destroying the legal-tender value of greenbacks; now withdrawing all paper money; now voting to pay bondholders in gold, tho the soldiers who risked their lives in war were paid in paper; now demonetizing silver; now repealing what few bills have been passed looking toward a larger currency. When the producing masses have induced Congress to at least compromise, they have seen the money power influence the President to a veto. Recently they have seen the administration, in closest intimacy with a secret syndicate, giving it favorable terms on loans of millions of dollars, the interest on which the people must pay. Is it any wonder that the cry of a gold conspiracy has been raised? Mrs. S. Emery's *Seven Financial Conspiracies* is said to have reached a sale of 400,000 copies. As its statements have played a large part in financial history we quote a synopsis of it here, given by Mr. G. B. Waldron in his *Handbook on Currency and Wealth* (pp. 37-40). Mr. Waldron gives also the answer which Mr. Sherman has made to the book, and we quote his answer. It will be seen, as stated above, that Mrs. Emery is wrong in charging conspiracy, but also that she is not wrong in her argument that our legislation has been unjustly influenced again and again by the money interest.

Says Mr. Waldron:

"The first great conspiracy, according to Mrs. Emery, was in the law of February 25, 1862.

"Wherein it was stipulated that the greenback should be a legal tender for all debts, public and private, except duties on imports and interest on the public debt, which from that time forward should be paid in coin."

"This 'created a demand for gold,' and sent it to a premium, reaching 18 per cent. in 1864. The special advantage of this to 'Shylock' was that 'he could buy bonds with greenbacks at face value, and by means of the exemption clause he could turn his gold into greenbacks at enormous advantage.' It further added greatly to the cost of imported goods, for which the war made a greatly increased demand. Duties being payable in gold, with gold at a premium, the prices of imported goods would be greatly advanced to the consumer.

"In a reply to this, made October 15, 1861, and widely circulated in the press, Senator John Sherman acknowledged that 'the duties on imported goods were required to be paid in coin, in order to provide the means to pay the interest on our bonds in coin.' Then he adds:

"This clause had not only the cordial support of Secretary Chase, but of President Lincoln, and proved to be the most important financial aid of the Government devised during the war. Goods being imported upon coin values, it was but right that the duty to the Government should be paid in the same coin. Otherwise, the duties would have been constantly diminishing with the lessening purchasing power of our greenbacks. If the interest of our debt had not been paid in coin, we could have borrowed no money abroad, and the rate of interest, instead of diminishing, as it did, would have been largely increased, and the volume of our paper money would necessarily have had to be increased, and its market value would have gone down lower and lower, and probably ended, as Confederate money did, in being as worthless as

rag. This exemption clause saved our public credit by making a market for our bonds, and was paid by foreigners for the privilege of entering our markets.

"For proof of conspiracy the famous 'Hazzard Circular' is offered in evidence (not by Mrs. Emery, however). This purports to be issued by Charles Hazzard, an agent of London capitalists in 1862, to New York capitalists. It is said to have been taken

from letter-files of the First National Bank of Council Grove, Kan., by Isaac Sharp in 1873, and first published in the Council Grove *Guard* September 18, 1886. James G. Nisbett made affidavit in the county of Posey, Indiana, on May 29, 1894, that, while on guard in the army at Lebanon, Ky., about the 25th of July, 1862, he with Sheridan Anderson, now deceased, were ordered to follow a party of three, one woman and two men, and that when asked to account for themselves one of them gave his name as Charles Hazzard, told that he was an Englishman in this country on business, and gave them a package of envelopes containing circulars. One of these Nisbett retained, and in his affidavit gave in full substantially as it appeared in the Council Grove *Guard*. It is as follows:

"Slavery is likely to be abolished by the war power, and chattel slavery destroyed. This I and my European friends are in favor of, for slavery is but the owning of labor, and carries with it the care of the laborer, while the European plan led on by England is capital control of labor by controlling wages. This can be done by controlling the money. The great debt, that capitalists will see to it is made out of the war, must be used as a measure to control the volume of money. To accomplish this, the bonds must be used as a banking basis. We are now waiting to get the Secretary of the Treasury to make this recommendation to Congress. It will not do to allow the greenbacks, as they are called, to circulate as money any length of time, as we cannot control them. But we can control the bonds, and through them the bank issues."

"The second 'conspiracy,' according to Mrs. Emery, was the national banking system in 1863.

"By it Shylock was permitted to invest his greenbacks in Government bonds at face value. Upon these bonds he not only drew gold interest in advance, but by means of the bank scheme he actually had 90 per cent. of their value returned to him. While drawing interest upon the entire investment in the form of bonds, 90 per cent. of it has been returned to him in the form of national bank-notes, and it is with these he carries on his banking business, loaning them out upon the most advantageous terms."

"Of this national banking system Senator John Sherman says:

"It is now conceded to have been the best form of paper money issued by banks that has ever been devised. It was organized to take the place of the State banks, which at the beginning of the war had outstanding over \$200,000,000 of notes, of value varying from State to State, and most of it at a discount of from 5 to 25 per cent. It was absolutely necessary to get rid of these State bank-notes, and to substitute in their place the notes of banks which were secured beyond doubt by the deposit of United States bonds, a system so perfect that, from the beginning until now, no one has lost a dollar in the circulating notes of national banks."

"*Conspiracy No. 3.*—According to Mrs. Emery the act of April 12, 1866, was passed for the purpose of contracting the currency by destroying the greenbacks, upon which the people paid no interest. This gave 'Shylock' more bonds, and at the same time 'lowered the prices of other property and added that much more to the burdens of the debtor class.' It doubled the debt of the Government, so that 'to-day it would take more bushels of wheat, more tons of hay, or bales of cotton, to pay our national debt than it would have taken at the close of the war.'

"On this point Senator Sherman denies that there has been any contraction, saying:

"It has been demonstrated by official documents that, from the beginning of the war to this time, the volume of our currency has been increasing year by year more rapidly than our population. . . . The statements made by Mrs. Emery about the contraction of our currency are not only misleading, but they are absolutely false. She states that in 1868 \$473,000,000 of our money was destroyed, and in 1869 \$500,000,000 of our money passed into a cremation furnace, and in 1870 \$67,000,000 was destroyed. Now, these statements are absolutely false. What she calls

money in these paragraphs was the most burdensome form of interest-bearing securities, Treasury notes bearing 7½ per cent. interest, and compound-interest notes. These were the chief and most burdensome items of the public debt. They were paid off in the years named, and were never at any time for more than a single day money in circulation. When issued they were received as money, but as interest accrued they became investments, and were not at all in circulation."

"Says Mrs. Emery:

"*Conspiracy No. 4.*—The fourth act in Shylock's tragedy, by which the Government and its great people were sacrificed, is familiarly known as the *credit-strengthening act*, by which the 5-20 bonds were made payable in coin.

This act, approved March 18, 1866, added to the burdens of the people more than six hundred millions of dollars. It is claimed by many bondholders and their leaders that the act which authorized the issue of these bonds made them payable in gold. But there is no such possible interpretation of the act; and if they were issued payable in gold in the first place, why did they pass the credit-strengthening act of 1869? The very fact that they passed that act four years after the close of the war, when the country was at peace with the world and itself, is proof beyond question that they were at first made payable in legal tender, and that this law was passed for no other purpose than that of doubling the wealth of the bondholder, which, of necessity, must and *did* double the burdens of the people."

"She further declares that Grant's election to the Presidency and Sherman's appointment to the Treasury were secured through their pledges to obtain the passage of this infamous act."

"Senator Sherman says with reference to this act:

"I maintain, and still believe, that by a fair construction of the loan laws we had a right to pay the principal of the bonds as they matured in greenbacks of the kind and character in existence when the bonds were issued, but I insisted that it was the duty of the Government to define a time when the greenbacks should be either redeemed or maintained at par in coin; that this was a plain obligation of honor and duty which rested upon the United States, and that it was not honorable or right to avail ourselves of our own negligence in restoring these notes to the specie standard in order to pay the bonds in the depreciated money. This idea is embodied in the credit-strengthening act."

"*Conspiracy No. 5.*—The next step Mrs. Emery says was that of refunding the national debt by the act of July 14, 1870:

"It was a scheme to perpetuate the debt, and a plot against the people to keep them forever under the yoke of bondage. . . . It has placed the burden beyond the control of the generation that created it. We have already paid interest enough to have twice paid the debt, and yet to-day it is a greater burden upon the people than it was at the close of the war. . . . There is but one interpretation to the funding act; its object is to compel our children and children's children, through all generations, to serve the children of these bondholders."

"In reply to this, Senator Sherman says:

"At the date of the passage of the refunding act, July 14, 1870, we had outstanding bonds bearing 5 and 6 per cent. interest for about \$1,500,000,000. By the wise providence of Congress we had reserved the right of redeeming a portion of this debt within five years, and a portion of it within ten years, so that the debt was, in the main, then, redeemable at our pleasure. It was not possible to pay it in coin, and it was not honorable to pay it in greenbacks, especially as that could only have been done by issuing new greenbacks far beyond the volume existing during the war, and which would at once depreciate in value and destroy the public credit, and dishonor the country. We therefore authorized the exchange, par for par, of bonds bearing 4, 4½, and 5 per cent. interest for the bonds bearing a higher rate of interest. The only contest in Congress upon the subject was whether the new bonds should run 5, 10, and 15 years, or 10, 15, and 30 years. I advocated the shorter period, but the House of Representatives, believing that the new bonds would not sell at par unless running for a longer period, insisted that the 4 per cent. bonds should run for 30 years. . . . It required some 10 years to complete these refunding operations—of which the larger part was accomplished while I was Secretary

Currency
Contraction.

of the Treasury—and they resulted in a saving of one-third of the interest on the debt.

"*Conspiracy No. 6.*—In the words of Mrs. Emery: 'We next find these civilized brigands have consummated a scheme for the *demonetization of silver.*' This act, passed in 1873, destroyed the money quality of silver, and thus produced a farther contraction of the currency. The object of this act was first to prevent the payment of the bonds, and second to increase their value."

Demonetization of Silver.

Alleged Bribery by Ernest Seyd.—Here the claim of conspiracy is brought forward in great detail. *The Banker's Magazine* of August, 1873, is quoted, as follows, by Senator Daniel of Virginia, in a speech delivered in the Senate, May 22, 1870 (p. 5128):

"In 1872, silver being demonetized in Germany, England, and Holland, a capital of £100,000 [\$500,000] was raised, and Ernest Seyd was sent to this country with this fund, as agent for foreign bondholders, to effect the same object."

"Mrs. Emery says (p. 52) that this testimony is corroborated by *The Congressional Globe* of April 9, 1872, as follows:

"Ernest Seyd of London, a distinguished writer and bullionist *who is now here*, has given great attention to the subject of mint and coinage. After having examined the first draft of this bill (for the demonetization of silver), he made various sensible suggestions, which the committee adopted and embodied in the bill."

"Frederick A. Luckenbach appeared before James A. Miller, the clerk of the Supreme Court at Denver, Col., on May 6, 1872, and made affidavit that as an inventor and business man, at Philadelphia and New York, he made several business visits to London; that he became well acquainted with Mr. Ernest Seyd in London, meeting him first in 1865, and renewing his acquaintance with him each year, and 'upon each occasion became his guest at one or more times, joining his family at dinner or other meals.' In February, 1874, while at dinner at Mr. Seyd's house, the conversation turned on rumored corruption in the Parliament, and Mr. Seyd told him that 'he [Seyd] could relate facts about the corruption of the American Congress that would place it far ahead of the English Parliament in that line.' Mr. Luckenbach relates that after dinner Mr. Seyd took him apart, and after making him pledge his honor not to relate what he was about to say, made this statement:

"I went to America in the winter of 1872-73, authorized to secure, if I could, a bill demonetizing silver. It was to the interest of those I represented—the governors of the Bank of England—to have it done. I took with me £100,000 sterling, with instructions if it was not sufficient to accomplish the object, to draw for another £100,000, or as much as was necessary."

"He said that German bankers were also interested in having it accomplished, and that he was the financial adviser of the bank. He continued:

"I saw the committee of the House and Senate, and paid the money, and stayed in America until I knew the measure was safe."

"This affidavit of Mr. Luckenbach was made after the death of Mr. Seyd. A few weeks later there appeared in the New York *Evening Post* a letter from Ernest Seyd, his son, and Richard Seyd, his brother, giving an unqualified denial of these statements. They say:

"Ernest Seyd was not in the United States at that date, for the purpose of bribing members of Congress to vote for the demonetization of silver, never having been there since 1856. The statement is the more absurd as he was the first to take up the cause of silver in England against the prevailing doctrine here, and remained a consistent supporter of silver, as his numerous works on the subject will show."

"There is no question that Mr. Seyd was a bimetalist, but it has been claimed on the other side that Mr. Seyd, in coming to this country, was acting not in accordance with his own beliefs, but in the interests of his clients, the Bank of England, and that, if the son and brother are honest in defense of a dead member of their family, they may have been mistaken. Mr. Seyd may have come to America at the time without their knowledge."

"But Mr. Alfred T. Story, an English correspondent for *The Voice* [given in *The Voice* of May 30, 1895], went to see the son and brother of Ernest Seyd at London, and was shown the letter-books of the firm for the years 1872 and 1873, when Mr. Seyd was said to

have been in America. He made a special investigation of the signatures of Ernest Seyd, Sr., from October, 1872, to March, 1873, and 'found that they were frequent all through that period; and there were certainly no breaks between the dates long enough for Mr. Seyd to have paid a visit to the States.' These signatures were pointed out to him by the cashier of the firm, who was in the business with them in 1872-73. The cashier said that he was prepared to take oath that the signatures were Ernest Seyd's, Sr.

"When asked whether he knew Frederick A. Luckenbach, and whether he was on such terms of intimacy with Ernest Seyd's family as to make his statement at all possible, Mr. Richard Seyd said:

"Mr. Luckenbach had an introduction to us, and he on several occasions dined at my own and my brother's house. Mr. Luckenbach, however, was an uneducated man, and I can only suppose, putting the most charitable construction on Mr. Luckenbach's statements, that that gentleman misunderstood some jesting that may have taken place, and upon such misunderstanding built up his strange accusations."

"As to the quotation in *The Banker's Journal*, the editor of that journal in New York city declares that no such statement ever appeared in the pages of *The Journal*. The quotation from *The Congressional Globe* occurs in a speech by Mr. Hooper of Massachusetts, before the House. He does refer to and received from Ernest Seyd of London, in reference to the bill then before Congress, which resulted in the demonetization of the silver dollar, but the words which are printed in italics

Mr. Seyd.

(see p. 41), '*who is now here*,' making Mr. Seyd to be actually present in the country at that time (1872), do not appear in the records of *The Congressional Globe*, and seem to have been added by some one to the quotation."

"The letter of Ernest Seyd to Mr. Hooper has since been published in the records of Congress. (Senate Mis. Doc. No. 20, Fifty-third Congress, first session.) It is dated 'La Princes Street Bank, London, February, 17, 1872,' and among other things of a technical character recommends the coining of a silver dollar of 400 grains legal tender to any amount not exceeding \$100 (or \$50). Near the close of his long letter Mr. Seyd makes this statement:

"I am myself, as you will perceive from my writings, and others with me, in favor of the full and complete adoption of the double valuation, giving full legal tender to coins as low even as one-fourth dollar in value, believing that this is the only true system upon which a future universal system of coinage can be based. Nevertheless, recognizing the difficulty of carrying this point at present, and in order to enable you to uphold the essential features of the gold valuation, I limit my recommendation to the issue of this single full-valued dollar-piece, under the proposed restriction of tender value to \$50 or \$100, partly for enabling you, without drawback or inconvenience whatever, to widen or to close the valuation question at any time, and partly in order to relieve you of the unsuitable obligations of the mint to redeem a surplus of either the token silver or the token copper coinage."

"Whatever may be said as to the question of conspiracy in the act of 1873, the fact remains that the standard silver dollar was dropped out of the law, and not again restored until the act of 1878."

"Mrs. Emery says that the panic of 1873 was the direct result of this demonetization, but it is difficult to see how this could be, since the time between demonetization and the panic was so short, and there was little silver in circulation at the time."

"At about this time appeared two circulars to which reference is frequently made by writers on the question of conspiracy by the moneyed men of the country. Under date of October 9, 1877, it is stated that the following circular was sent to all the bankers of the country:

"DEAR SIR: It is advisable to do all in your power to sustain such prominent daily and weekly newspapers, especially the agricultural and religious press, as will oppose the issuing of greenback paper money, and that you also withhold patronage or favors from all applicants who are not willing to oppose the Government issue of money. Let the Government issue the coin, and the banks issue the paper money of the country, for then we can better protect each other."

"To repeal the law creating national bank-notes, or to restore to circulation the Government issue of money, will be to provide the people with money, and

will, therefore, seriously affect your individual profit as bankers and lenders. See your Congressman at once, and engage him to support our interests, that we may control legislation.

"JAMES BUELL, Secretary,
"247 Broadway."

"Colonel S. F. Norton of Chicago, author of *Ten Men of Money Island*, is said to have a copy of this circular given him by a banker in Bloomington, Ia.

"*Attempted Press Bribery.*—The Chicago *Inter-Ocean* (Rep.) of October 20, 1877, contains the following:

"The *Inter-Ocean* acknowledges the receipt of the following singular document which came to this office from New York, Saturday morning:

"THE AMERICAN BANKERS' ASSOCIATION,

"247 Broadway, Room 4.

"New York, October 9, 1877.

"Strictly private.

"DEAR SIR: Please insert the inclosed printed slip as leaded matter on the editorial page of your first issue immediately following the receipt of this, and send marked copy with the bill to

"Yours truly,

"JAMES BUELL, Sec'y.

"Comments on the slip, not to exceed half a column, will be paid for, if billed at the same time.

"J. B."

"The following is the document, which we are asked to insert as leaded matter on the editorial page; in other words, as a statement made by the *Inter-Ocean*.

"The Greenback Party has offered, through its managers, to sell out to the Democrats and hereafter to work in Democratic harness if a few of their leaders can be provided for. This shows how much dependence there is to be placed on the leaders of the lunatics who clamor for money based on nothing."

"We insert this, but we shall send no bill for it. We shall send no bill because, in the first place, we do not follow directions about leading it; secondly, we can't believe a word of the statement to be true. We do not know who is managing the affairs of the American Bankers' Association; but, whoever he is, we advise that body to get rid of him without delay. The attempt to thus maliciously destroy the Greenback Party, without submitting a word of proof, is a piece of effrontery which ought to be beneath any body of commercial gentlemen, and especially the American Bankers' Association. We refuse to believe that such an extraordinary document was authorized by that body."

"In the New York *Sun* (Dem.) of October 25, 1877, only four days earlier, appeared notice of the receipt of a similar letter requesting that the following be inserted:

"The prospect is that in six months there will not be a Greenback leader in all the land. Overtures have been made by the leaders of the Greenback movement to President Hayes to abandon the greenback as a lost cause, provided that he will give good official positions to about twenty of the most blatant of the clamorous for money that is based on nothing."

"It is but proper to say that James Buell is dead and cannot speak for himself; but others, at that time officers of the American Bankers' Association of New York city, deny that such circulars were ever issued by authority of the association.

"In the words of Mrs. Emery:

"*Conspiracy No. 7.*—This act, passed January 24, 1875, authorized the Secretary of the Treasury to destroy the fractional currency, and issue silver coin in like denominations to take its place. The people had found the fractional currency convenient, not only as a medium of exchange at home, but especially cheap and convenient for small remittances in trade. The destruction of this money was a serious injury to the business men of the country. For without fractional currency even small remittances incurred the expense of a draft or money-order. But Congress appeared to be looking after the interest of the money-monger, and not to the prosperity of the country.

"It next became necessary to issue bonds with which to purchase the silver bullion authorized for coinage. Let it be remembered that these were untaxed, interest-bearing bonds, and of such large denominations that only capitalists were able to carry them, while to the debt-ridden people was added the interest of these very bonds, which could only exist by the destruction of the greenbacks and fractional currency upon which the people paid no interest.

Resumption.

"The restoration of silver as a medium of exchange was a great triumph to the unthinking masses, and greatly increased their confidence in the governmental policy, but to those who studied the situation the jingle of silver was another death-knell to the prosperity of the country."

"This Senator Sherman calls 'the pride and boast of the Government of the United States,' since it resulted in 'the restoration of our notes, long after the war was over, to the standard of coin.'

"These are the seven acts of government, which Mrs. Emery calls the 'Seven Financial Conspiracies,' but which Senator Sherman in reply declares to be 'the seven great pillars of our financial credit, the seven great financial measures by which the Government was saved from the perils of war, and by which the United States has become the most flourishing and prosperous nation in the world.'"

Thus far Mr. Waldron's condensation of Mrs. Emery's charges and Senator Sherman's reply. It will be seen that as to conspiracy Mrs. Emery has not made out her case, and that the less Populist writers say about the Hazard circular, Mr. Seyd's alleged bribery, and the so-called Buell circular, the better for their cause. Nevertheless, he who does not read between the lines vital truths accompanied by occasional mistakes, can scarcely realize the situation. Whatever one thinks about the necessity of making the greenbacks not good in payment of duties or the interest on the public debt, only protectionists will accept Senator Sherman's glib answer that foreigners pay the duties on imports, while many will question the statement that we could only find a market for bonds by making them payable in gold. As for the creation of our present national banking system; contraction of the currency; the so-called "credit strengthening act"; the refunding of the debt; the demonetization of silver; resumption of specie payments—Mrs. Emery's concluding seven points—no person can deny that they took place; that they were each one pushed through Congress by the influence of the moneyed classes, and that they were every one in pursuance of a settled policy of gold monometalism. (For a discussion of them see CURRENCY.) The Populists have a grievance, and a bitter one, if all economists are right, that falling prices do depend on the quantity of the currency; that falling prices are fatal to prosperity, and that an expanded currency can raise prices. They have seen millionaires flourish and agriculturists suffer; they have steadily seen corporations and trusts fatten, and prices fall; they have seen great syndicates hand in glove with Presidents and controlling Congress. All they desire is the return of prices to where they were when most debts were contracted, and then, on that basis, the establishment of a just and scientific currency. Such, in brief, is the Populists' argument. It is with them an intensely moral one, and a cry for justice. If temporarily the monetization of silver should raise prices for the working classes before it raised their wages, Populists believe that, by raising prices, silver monetization will so stimulate industry that workmen will be employed all the time instead of on half time, as they are largely to-day, and so better off, even with higher prices. Investors in savings-banks, etc., will not be robbed, because they believe the talk of a 50-cent dollar

to be a false argument raised by interested classes and caught up by a deceived public. They believe that silver will be made equal with gold and that with quickened industry, living prices, the country can go on to a scientific currency, which shall be better than either silver or gold. If, on the other hand, the producers of factory and field do not unite against the gold interest, Populists believe that money must continue to contract, prices continue to fall, and a suffering result which may leave the workers almost helpless. Said President Walker, who is not a Populist (Address before the American Economic Association, December 26, 1890):

"The money supply is not a matter of no consequence. Alike considerable excess and considerable deficiency inevitably become the source of direful ills and woes unnumbered. If of an irredeemable and fluctuating paper currency, that alcohol of commerce, it can be said that 'it biteth like a serpent and stingeth like an adder,' with equal truth may it be added that strangulation, suffocation are not words too strong to express the agony of the industrial body when embraced in the fast-tightening folds of contracting money supply."

SINGLE TAX, THE.—A statement of the fundamental principles of the reform bearing the name of the Single Tax, and prepared for the *Financial Reform Almanack* of England, for the year 1891, by the great apostle of the movement, Henry George, is herewith presented. For a necessarily brief exposition, nothing more comprehensive and authoritative has been written. Speaking for himself and his associates, Mr. George says:

"We propose to abolish all taxes save one single tax levied on the value of land, irrespective of the value of improvements in or on it.

"What we propose is not a tax on real estate, for real estate includes improvements. Nor is it a tax on land, for we would not tax all land, but only land having a value irrespective of its improvements, and would tax that in proportion to that value.

"Our tax involves the imposition of no new tax, since we already tax land values in taxing real estate. To carry it out we have only to abolish all taxes save the tax on real estate and to abolish all of that which now falls on buildings or improvements, leaving only that part of it which now falls on the value of the bare land. This we would increase so as to take as nearly as may be the whole of the economic rent, or what is sometimes styled the 'unearned increment of land values.'

"That the value of land alone would suffice to provide all needed public revenues—municipal, county, and national—there is no doubt. To show briefly why we urge this change, let me treat (1) of its expediency, and (2) of its justice.

"(1) It would dispense with a whole army of tax-gatherers and other officials which present taxes require, and place in the Treasury a much larger proportion of what is taken from the people, while, by making government

simpler and cheaper, it would make it purer. It would get rid of taxes which necessarily promote fraud, perjury, bribery, and corruption; which lead men into temptation, and which tax what **Expediency.** the nation can least afford to spare—honesty and conscience. Since land lies out of doors and cannot be removed, and its value is the most readily ascertained of all values, the tax to which we would resort can be collected with the minimum of cost and the least strain upon public morals.

"It would enormously increase the production of wealth:

"A. By the removal of the burdens that now weigh upon industry and thrift. If we tax houses, there will be fewer and poorer houses; if we tax machinery, there will be less machinery; if we tax trade there will be less trade; if we tax capital there will be less capital; if we tax savings, there will be less savings. All the taxes, therefore, that we would abolish, are taxes that repress industry and lessen wealth. But if we tax land values, there will be no less land.

"B. On the contrary, the taxation of land values has the effect of making land more easily available by industry, since it makes it more difficult for owners of valuable land, which they themselves do not care to use, to hold it idle for a larger future price. While the abolition of taxes on labor and the products of labor would free the active element of production, the taxing of land values in taxation would free the passive element by destroying speculative land values and preventing the holding out of use of land needed for use. If any one will but look around to-day and see the unused or but half used land, the idle labor, the unemployed or poorly employed capital, he will get some idea of how enormous would be the production of wealth were all the forces of production free to engage.

"C. The taxation of the processes and products of labor on the one hand, and the insufficient taxation of land values on the other, produces an unjust distribution of wealth which is building up in the hands of a few fortunes more monstrous than the world has ever before seen, while the masses of our people are steadily becoming relatively poorer. These taxes necessarily fall on the poor more heavily than on the rich; by increasing prices, they necessitate larger capital in all businesses, and consequently give an advantage to large capitals; and they give, and in some cases are designed to give, special advantages and monopolies to combinations and trusts. On the other hand, the insufficient taxation of land values enables men to make large fortunes by land speculation and the increase in ground values—fortunes which do not represent any addition by them to the general wealth of the community, but merely the appropriation by some of what the labor of others creates.

"This unjust distribution of wealth develops on the one hand a class idle and wasteful, because they are too rich, and on the other hand a class idle and wasteful, because they are too poor—it deprives men of capital and opportunities which would make them more efficient

producers. It thus greatly diminishes production.

"D. The unjust distribution which is giving us the hundred-fold millionaire on the one side, and the tramp and the pauper on the other, generates thieves, gamblers, social parasites of all kinds, and requires large expenditure of money and energy in watchmen, policemen, courts, and prisons, and other means of defense and repression. It kindles a greed of gain and a worship of wealth, and produces a bitter struggle for existence which fosters drunkenness, increases insanity, and causes men whose energies ought to be devoted to honest production to spend their time and strength in cheating and grabbing from each other. Besides the moral loss, all this involves an enormous economic loss which the single tax would save.

"E. The taxes we would abolish fall most heavily on the poorer agricultural districts, and thus tend to drive population and wealth from them to the great cities. The tax we would increase would destroy that monopoly of land which is the great cause of that distribution of population which is crowding people too closely together in some places and scattering them too far apart in other places. Families live on top of one another in cities, because of the enormous speculative prices at which vacant lots are held. In the country they are scattered too far apart for social intercourse and convenience, because, instead of each taking what land he can use, every one who can grabs all he can get, in the hope of profiting by the increase of value, and the next man must pass further on. Thus we have scores of families living under a single roof, and other families living in dug-outs on the prairies afar from neighbors—some living too close to each other for moral, mental, or physical health, and others too far separated for the stimulating and refining influences of society. The waste in health, in mental vigor, and in unnecessary transportation results in great economic losses which the Single Tax would save.

"(2) Let us turn to the moral side, and consider the question of justice. The right of

Justice. property does not rest on human laws; they have often ignored and violated it. It rests on natural laws—that is to say, the law of God. It is clear and absolute, and every violation of it, whether committed by a man or a nation, is a violation of the command, 'Thou shalt not steal.' The man who catches a fish, grows an apple, raises a calf, builds a house, makes a coat, paints a picture, constructs a machine, has, as to any such thing, an exclusive right of ownership, which carries with it the right to give, to sell, or bequeath that thing. But who made the earth that any man can claim such an ownership of it, or any part of it, or the right to give, sell, or bequeath it? Since the earth was not made by us, but is only the temporary dwelling-place on which one generation of men follows another; since we who find ourselves here are manifestly here with the equal permission of the Creator, it is manifest that no

one can have any exclusive right of ownership in land, and that the rights of all men to land must be equal and inalienable. There must be an exclusive right to possession of land for one to reap the products of his labor. But this right of possession must be limited by the equal right of all, and should therefore be conditioned on the payment to the community by the possessor of an equivalent for any special valuable privilege thus accorded him.

"When we tax houses, crops, money, furniture, capital, or wealth in any of its forms, we take from individuals what rightfully belongs to them. We violate the right of property, and in the name of the State commit robbery. But when we tax ground values we take from individuals what does not belong to them, but belongs to the community, and which cannot be left to individuals without the robbery of other individuals.

"Think what the value of land is. It has no reference to the cost of production, as has the value of houses, horses, ships, clothes, or other things produced by labor; for land is not produced by man, it has been created by God. The value of land does not come from the exertion of labor on land, for the value thus produced is a value of improvement. That value that attaches to any piece of land means that that piece of land is more desirable than the land which other citizens may obtain, and that there are more willing to pay a premium for permission to use it. Justice, therefore, requires that this premium or value shall be taken for the benefit of all, in order to secure to all their equal rights.

"Consider the difference between the value of a building and the value of land. The value of a building, like the value of goods, or of anything properly styled wealth, is produced by individual exertion, and therefore properly belongs to the individual; but the value of land only arises with the growth and improvement of the community, and therefore properly belongs to the community. It is not because of what its owners have done, but because of the presence of the whole great population, that land in New York is worth millions an acre. This value, therefore, is the proper fund for defraying the common expenses of the whole population; and it must be taken for public use, under penalty of generating land speculation and monopoly, which will bring about artificial scarcity where the Creator has provided in abundance for all whom his providence has called into existence. It is thus a violation of justice to tax labor, or the things produced by labor, and it is also a violation of justice not to tax land values.

"These are the fundamental reasons for which we urge the Single Tax, believing it to be the greatest and most fundamental of all the reforms. We do not think it will change human nature. That man can never do; but it will bring about conditions in which human nature can develop what is best instead of, as now in so many cases, what is worst. It will permit such an enormous production of wealth as we can now hardly conceive. It will secure an equitable distribution. It will solve the labor problem,

if the single tax will change

and dispel the darkening clouds which are now gathering over the horizon of our civilization. It will make undeserved property an unknown thing. It will check the soul-destroying greed of gain. It will enable men to be at least as honest, as true, as considerate, and as high-minded as they would like to be. It will remove temptations to lying, false swearing, bribery, and law-breaking. It will open to all, even to the poorest, the comforts and refinements and opportunities of an advancing civilization. It will thus, so we reverently believe, clear the way for the coming of that kingdom of right and justice, and consequently of abundance and peace and happiness, for which the Master told his disciples to pray and work. It is not because it is a promising invention or cunning device that we look for the Single Tax to do all this; it is because it involves a conforming of the most fundamental adjustments of society to the supreme law of justice, because it involves the basing of the most important of our laws on the principle that we should do to others as we would be done by."

Although the present political and social agitation of the land question, now active and increasing in every nation where representative government exists, dates only from the year 1879, when Henry George, the unknown California printer, published his great work, *Progress and Poverty*, the primary principles had been already recognized and enunciated by statesmen and thinkers. First among these were the famous physiocrats, to whom Mr. George dedicates his book on *Protection or Free Trade*, as follows: "To the memory of those illustrious Frenchmen of a century ago, Quesnay, Turgot, Mirabeau, Condorcet, Dupont, and their fellows, who in the night of despotism foresaw the glories of the coming day." These economists were far in advance of Adam Smith, desiring the abolition not only of protective duties but all taxes direct or indirect, except a single tax upon land values. In England the true philosophical statement of "The Right to the Use of the Earth" was first popularly presented by Herbert Spencer, in the famous ninth chapter of his work on *Social Statics*, published in 1850. At that time the practical applications of the principles enunciated seemed infinitely remote, and were treated as interesting abstract speculations. Since the publication, however, of *Progress and Poverty*, which brought the question of land monopoly into a practical relation with politics, making it "a burning question," Mr. Spencer has taken occasion in his latest volume of *Justice*, to modify and apologize for his early utterances. Nevertheless, the original statement stands and will continue to stand as the most complete ethical expression of the subject yet formulated. For a comprehensive consideration of Herbert Spencer's change of attitude, the reader is referred to *A Perplexed Philosopher* by Henry George (1892).

Others also of less note had discerned and enunciated the principle underlying the Single Tax, but it remained for the author of

Progress and Poverty, by that work of genius, to compel the world's attention to it. For a succinct and orderly idea of the origin and phenomenal growth of the organized Single-Tax movement, the reader is referred to the files of *The Standard* of New York, whose publication, beginning January 9, 1887, and ending August 31, 1892, covers the pioneer period. Its continuance was not deemed essential, for the reason that the press of the country could no longer avoid the discussion. In its place several journals in different parts of the country now (1894) devote themselves exclusively to the Single-Tax propaganda.

The ethical statement of the reform seldom meets with objection. It cannot be denied that justice demands equal access to natural opportunity for all human beings who must live upon this earth. It is indisputable that land is a bounty of the Creator and not the product of man; and that all wealth is derived from land by the application of man's labor. This truth once granted it follows logically that land must be separated from wealth, altho law and custom have mixed the two, confusing private property with natural opportunity. The distinction is clear and simple. What the individual makes is his. What nature supplies is the birthright of all. Hence, land ceases to be rightfully private property. It is for use, not for ownership. The Single Tax has the distinction of pointing out how, without disturbing existing titles, or weakening possession, or lessening security, justice may be done impartially. Access to land being a common right, private monopoly is a universal wrong, unless the user pays the community for the privilege. As sites vary in desirability, grading from those which are now useless to the New York lot which recently sold at the rate of \$15,000,000 per acre, the difference is distinguished as rent, a value created by the growth of the community and the demand for special situations. This preferential difference, or economic rent, made by and belonging to the people, is a natural fund, ample to sustain necessary government. By every one who uses land paying a proper rental for the privilege—not to the landlord, who now claims it, but to the Government, who dispenses it for the general good—substantial equity is secured.

The objections urged against the Single Tax are various, beginning with an expression of doubt concerning its beneficent working, and ending with the charge of confiscation. Granting that exact results are beyond human power of prediction, it may be safely affirmed that if the principles of the reform are correct, the result may be left to take care of itself. Every great movement in behalf of human welfare, like the abolition of the corn-laws or the emancipation of the American slave, has been forced to meet the same prophecies of evil, duly proved to be groundless.

As regards "confiscation," to give that name to the action of society in taking the value which it creates and which belongs to it, altho that value has for generations been

**Objections
Answered.**

misappropriated by individuals, is to misuse terms and confuse sacred rights. The Single Tax aims only to stop the present confiscation. It does not ask indemnity for the past, but security for the future. All it proposes is to take every year that value which society in its collective sense creates during that year, leaving untaxed everything made or produced by the individual.

The advocates of the Single Tax, while recognizing the justice and propriety of governmental control of certain natural monopolies, such as franchises belonging to all of the people, and now generally bestowed without compensation on private corporations, are by no means socialists. They would not substitute paternalism for individual freedom. The Single Tax aims at equality of opportunity and not of possessions. With fair play and an open field, it would trust results. It does not fear competition, but has no faith in the stability of a society where free competition is denied. It repudiates the game where part of the players use loaded dice. It has more faith in the people than in their rulers, and does not think that any combination, whether it calls itself a trust or a government, can manage private affairs half as well as the people can do it themselves. Rather it demands less government and more freedom.

For a comprehensive discussion of the Single Tax, touching all points at issue, the reader is referred to the works of Henry George, notably *Progress and Poverty*; *Social Problems*; *Protection or Free Trade*; *The Land Question*; *The Condition of Labor* (*An Open Letter to Pope Leo XIII.*); and *A Perplexed Philosopher*. W. S. GARRISON.

OBJECTIONS TO THE SINGLE TAX.

Objections to the Single Tax usually come from two opposite standpoints, from conservatives who believe in private property in land, and from socialists or other radical thinkers, who consider the Single Tax an inadequate way of meeting the land problem. The two classes of objections may be briefly summarized as follows:

First, conservatives argue against the Single Tax as in the first place based on false assumptions in justice. Mr. George bases his argument on the assumption that since, to use his words, "Land values arise from the presence of all . . . the land belongs equally to all." This is of course a *non sequitur*. The land does not belong equally to all unless its value is contributed to equally by all, which is notoriously not the case. As Mr. Spahr points out in *The Political Science Quarterly* (vol. vi. No. 4), there are many individuals whose presence on land lowers its value, while there are many more whose presence increases land values very slightly. He instances in America, the North American Indians and the Hungarians and Italians, who pour into New York City. It depends on how much land is improved, whether the presence of people gives it value. It is even questionable whether, were it not for improvements, land would have any value. Undoubtedly unimproved lots surrounded by improved lots have often im-

mense value, but remove *all* improvements and how much value would they have? Therefore it is said to tax land values is as much to tax labor as any other tax, and like any other tax to tax an earned increment. Thus, the foundation in justice of the Single Tax is overthrown.

Secondly, conservatives argue that the Single Tax is unjust because it distinguishes between forms of labor. Here is a man who has put all his earnings into land; another has invested his in manufactures. Neither themselves work, yet the Single Tax would take the whole income of the one and not touch the income of the other.

Thirdly, conservatives argue that the Single Tax would work ill, because it would weaken at its very vital point the sense of private ownership in the soil, which has been the very keystone of society. (For a discussion of this, see LAND.)

Fourthly, conservatives argue that the Single Tax would not raise sufficient revenue for the government to enable it to do away with all other taxes, and so the whole theory of the Single Tax would be upset. Says Mr. Spahr (*idem*):

"As regards England, we have fortunately at hand the statistics prepared by Mr. Giffen in his paper before the Statistical Society in December, 1883, in which he was not considering the subject of the Single Tax, and is therefore not open to the charge of special pleading. The value of the farm lands of Great Britain in 1883 was \$8,400,000,000. The value of the houses was \$9,500,000,000. If we assume that 60 per cent. of the value of the English houses was the value of the land on which they stood, then the total value of all the land in England was but \$14,000,000,000. The taxation of England in 1883 was \$750,000,000, of which not to exceed \$100,000,000 rests upon land. The question then is, could the land of England support an additional tax of \$650,000,000? The answer is obvious when we remember that Mr. Giffen arrived at the total land value by multiplying rentals by thirty; that is, the average rental of land in England is $\frac{1}{30}$ per cent. Three and one-third per cent. upon \$14,000,000,000 would be but \$470,000,000. In other words, the Single Tax in England, even if the entire rentals of the land inclusive of improvements incorporated within the soil were taken, would produce a deficit of \$200,000,000 annually.

"In America the aggregate deficit is less clear. Yet here we find that in most of our Eastern States the local taxes alone have for years been much greater than the aggregate increase in the values of the land. For example, in Connecticut during the past 15 years, the assessed value of the land has increased \$36,000,000. The aggregate taxes paid have been more than \$70,000,000. As these taxes have been contributed by the property-owners, the latter have already more than paid for the increment which they have received. The logical application of the Single-Tax theory would require that the property-owners receive back the taxes they have advanced, and turn over to the public the increment that has arisen. This would leave the public vastly in debt to the property-owners, instead of the property-owners vastly in debt to the public."

Fifthly. It is argued that the Single Tax rests on a complete misreading of present facts. Mr. Spahr continues in the above article:

"The fundamental mistake of Mr. George and the Single-Tax advocates is their conception that in the value of the land the community has a vast element of wealth which has somehow come of itself, without the expenditure of labor or capital. A correlative error is their assumption that another amount equally vast may now be created without labor, by adopting their system. Their platform promises that the Single Tax would make it impossible for speculators and monopolists to hold opportunities unused or only half used, and would throw open to labor the illimitable

field of employment which the earth offers to man. It would thus solve the labor problem, doing away with involuntary poverty, raise wages in all occupations, and cause such an enormous production of wealth as would give to all comfort, leisure, and participation in the advantages of an advancing civilization.

"Here it is assumed that if the taxes now levied upon houses and improvements were repealed, there would at once be an immense addition to the national wealth. All the unimproved farm land would at once be brought under cultivation; all the vacant building lots would at once be covered with houses. This were indeed a consummation devoutly to be wished, but this is the most absurd portion of the entire Single-Tax program. Houses cannot be built except out of new savings, unless capital can be withdrawn from other enterprises. To withdraw capital from other enterprises where it is more remunerative, and put it into the building of houses which will not be needed by the community for years, or into the improving of farms whose cultivation is not yet demanded, would be the most enormous possible waste of our national wealth. There is no vast fund of wealth in the air which can be brought to earth by the touch of Mr. George's magic wand. The amount of wealth which society can produce is limited by the amount of labor and capital which society has at its disposal. Any plan to turn this investment out of its natural channel involves an economic loss. Except in trivial and exceptional cases, there is no wealth which is not the product of labor, and no wealth can be created except as the product of labor."

Lastly, conservatives argue that rent is not the enormous evil it is considered by land reformers, and that what evil it does do will not be removed by the Single Tax. Mr. W. T. Harris, writing in the *Boston Transcript*, November 21, 1895, argues that judging by data derived from the United States census, and State census of Massachusetts for 1885, the total value of land in 1880 was \$10,000,000,000, and the total rent in the neighborhood of \$400,000,000, or little over two cents per day for each inhabitant. Of the inability of the Single Tax to remove the evils of rent for the city poor, Professor Seligman says (Single-Tax discussion before the American Social Science Association, September 5, 1890):

"How is the Single Tax going to relieve the inhabitants of the slums? They will not go to the suburbs, where there is plenty of land, for the same reasons that they do not go there now. Rent in the suburbs or uptown districts is at the present moment vastly less than in the crowded slums, and yet the slums are crowded. The average workman prefers to be near his work, prefers to enjoy the social opportunities of contact with his fellow-workman, evenings as well as daytimes. All careful students of the problem of housing the poor have come to the conclusion that it is in the crowded centers where there is no unoccupied land, and not in the suburbs where rents are low, that the problem must be solved. Now, when we look at the thing from a practical standpoint, how is the tenement-house workman to derive any benefit from the Single Tax? His rent will be just exactly as high as at present; for his rent is a veritable rack-rent, fixed by the stress of competition. The competition for rooms will be not a whit less when the State becomes the landlord. And how are his wages to be increased? Wages can be increased in only one of three ways—through the increase of capital, through the increased efficiency of the laborer, or through the increased standard of living, which will enable the workman to compel higher wages. But the Single Tax can accomplish none of these three things. To take away economic rent and to turn it over to the State, will not increase capital one whit, will not decrease the monthly rent of the tenement-house population by one iota. Into what does all this fair dream of economic felicity resolve itself? Into mere mist, into mere nothingness. The tenement-house population, no more than the American farmer, will derive no advantage from the Single Tax."

The socialist objections to the Single Tax are different. They agree absolutely with the Single-Taxers, that the natural values of the

soil should belong to no individual. They favor land nationalization, and many of them believe that the Single Tax would be a good way to introduce such a measure, but they do not believe in the taxation of land values as a Single Tax, nor that by itself the Single Tax would do much good, nor even that it should be favored as a practical first step toward socialism. They favor only the increasing taxation of land values in connection with other reforms, as is being done in Australia as a part of a socialist programme. They object to the Single Tax by itself or even as a first step, first, because by itself, or even by itself for a while, it would do little good. As Professor Seligman has shown above, it would not lower rent in the cities, but only transfer rent to the government. It might throw suburban land held for speculation on to the market; but only those could buy this land who had capital with which to improve it. Poor men could not get the land. But rich men could hire labor to improve it, and this would employ labor. Yes, but at what prices? Only by withdrawing capital from other investments and attracting laborers from other cities, which would mean a competition changing, rather than raising wages. The attracted laborers too would have to live somewhere. They could not buy the land, nor live far from their work, hence they would crowd into the already overcrowded slums, and thus raise rents. Landlords could put up cheap tenement-houses, make profits from them, and still pay all the land values to the government.

A deeper socialist objection is that the Single Tax, presented as it usually is as a substitute for socialism, would simply rivet the chains of the working man. Single-Taxers usually claim that if land values were taxed, land would be thrown open to all, all would have opportunity to labor and could secure the full return of their labor; the smart getting much, and the less able less, but each according to his deserts. This is not at all the case. Taxing land values would not throw land open to all, but only to those with capital, for according to the theory, those offering most for the land would get it, and capitalists could offer most. Even if all did get land, they could not keep it. Men are not equal in ability. Smart men with land would make better use of it than others. They could afford to buy machinery; other men could not. With that advantage they could undersell and eventually drive out the feebler folk, who would have to toil at wage labor as to-day. The smart men could leave money to their children, and so children, even tho' not smart themselves, could live in idleness, while others toiled for them as to-day. The Single-Taxers' glorification of competition plus a Single Tax calls for the competition of equals, to be just. In practice it would be the competition of unequals, which means the rule of smartness, shrewdness, and force, which is not just. Some argue that it is just that the strong should get the good of their strength and that the weak should suffer for their weakness.

Socialist Objections.

This possibly would be just, if men wholly made themselves, but men do not. They are largely modified by environment. The well-fed son of a capitalist can get land and live in idleness, hiring the sickly son of a sickly working man to toil for him. Is this just?

Thirdly, socialists deny any such distinction between land values and other values as the Single Tax claims. If individuals alone have not produced the land, they also have not alone produced other things. All production as well as that of land values belongs to all. Says Professor Seligman (*idem.*):

"Individual labor, I venture to say, has never by itself produced anything in civilized society. Let us take the workman, fashioning a chair. The wood he certainly has not produced. The tools that he uses are the result of the contribution of others. The house in which he works, the clothes he wears, the food he eats (all of which are necessary to the making of a chair in civilized society), are the result of contributions of the community. His safety from robbery and pillage—nay, his very existence—is dependent on the ceaseless cooperation of the society about him. How can it be said, in the face of all this, that his own individual labor wholly creates anything? If it be answered that it pays for his tools, his clothing, his protection, etc., I say, So does the land-owner pay for the land he purchases. Nothing, I repeat, is wholly the result of unaided individual labor. No one has a right to say, This belongs completely and absolutely to me, because I alone have produced it. In truth, this is the groundwork of socialism. The socialists have been far more logical than Henry George. They deny the existence of any difference, save that in degree, between property in land and property in other capital. That is the reason why the English enthusiasts are leaving land nationalization and enrolling themselves under the banners of socialism. That is the reason why, in this country, the growth of Bellamy's nationalism marks the gradual decadence of the Single-Tax movement. That is the reason why any one who has to do with laboring men throughout the country is now meeting in every center hundreds who were formerly Georgites, but who now have become converted to the newer forms of socialism."

SISMONDI, JEAN CHARLES LÉONARD SIMONDE DE, was born in Geneva, Switzerland, in 1773. Educated in his native town he became a clerk in Lyons, but political disturbances drove him into exile and he lived in England and Italy for some years. He settled in Geneva in 1800, and devoted himself to literature, politics, and economics. He married an English wife in 1819. He died in Geneva in 1842.

He wrote first a treatise *De la Richesse Commerciale* (1803), in which he followed strictly the principles of Adam Smith. But he afterward came to regard these principles as insufficient and requiring modification. He contributed an article on political economy to the *Edinburgh Encyclopædia*, in which his new views were partially indicated. They were fully developed in his principal economic work *Nouveaux Principes d'Économie Politique, ou de la Richesse dans ses Rapports avec la Population* (1819), and *Études sur les Sciences Sociales* (3 vols., 1836). He became, however, best known as a historian with his *Histoire des Républiques Italiennes des Moyen Âge* (16 vols., 1807-18), his *Histoire des Français*, 31 vols. (1821-49), and lesser works.

SLAVERY.—Slavery is the first condition in which laborers as a class appear in history. In the hunter period of our human history the

conqueror does not enslave his vanquished foe, but slays him at once; in the pastoral period slaves are generally captured only to be sold; but when sedentary life begins, slavery originates. Especially where warlike habits prevail, slaves are procured to provide food for their military masters. Slavery was modified wherever theocratic organizations became established, and only reached its extreme form where the military order dominated the sacerdotal. Slavery was an advance on what went before. It was infinitely better than cannibalism, or the wholesale slaughter of the captives in war. It may be said here that *slave* was originally a national name; it meant a man of Slavonic race captured and made a bondman by the Germans. Its ultimate derivation is from *slava*, glory.

Wherever slavery has existed, it has meant wrong, injustice, violence, brutality, engendered both in master and slave. Prisoners of war, held for debt, or self-sold—slaves have had little but cruel treatment until their emancipation by death. Hebrew slavery was milder than that of any other nation. The law protected the slave from violence and from permanent bondage. Every slave was to be emancipated at the seventh year. (See JUDAISM.) In Greece we find slavery fully established in the Homeric period. War captives are enslaved, sold, or held at ransom. Sometimes the women only are saved from slaughter. Pirates occasionally kidnaped free persons and sold them for slaves in other regions. Not unfrequently the slave would be of nobler birth than his owner. The men slaves were made to till the ground and tend the cattle, and the women slaves to perform the domestic duties.

It is, however, most interesting and important to study slavery as it appeared later in historic Greece, and especially at Athens. The sources of slavery in Greece were: (1) Birth, the enslavement of slaves' children. This was not a common source, as it was found cheaper to buy a slave than to rear one. (2) Sale of children by their free parents. (3) Through indigence freemen sometimes sold themselves; and at Athens, before Solon, an insolvent debtor became the slave of his creditor. (4) Capture in war. After Thebes was taken by Alexander, 30,000 women and children are said to have been sold. (5) Commerce. There was a systematic slave-trade. The principal slave-markets were Athens, Chios, Cyprus, Samos, and Ephesus. Thrace was the chief source of supply. Servile labor gradually displaced free labor, not only in agriculture but in manufactures and commerce as well. Speculators either directly employed slaves or hired them out for profit. Athenæus gives the number of Athenian slaves as 400,000; Hume however says it should be 40,000.

The condition of the slaves at Athens was not as bad as in many other countries. Privileges were allowed them which in Rome would have been termed license. Says Dr. Ingram:

"The slave was introduced with certain customary rites into his position in the family; he was in practice, though not by law, permitted to accumulate a

**Early
Slavery.**

private fund of his own; his marriage was also recognized by custom; though in general excluded from sacred ceremonies and public sacrifices, slaves were admissible to religious associations of a private kind; there were some popular festivals in which they were allowed to participate; they had even special ones for themselves, both at Athens and in other Greek centers. Their remains were deposited in the family tomb of their master, who sometimes erected monuments in testimony of his affection and regret."

The Athenian law afforded some protection to the slave. He had an action for outrage, like a freeman; and if killed by a stranger was avenged as a citizen. If a master slew a slave, it was atoned for by exile and religious expiation. Even when the slave struck back and killed his master, he had to be handed over to the magistrate for punishment. There were several ways in which a slave might become a freeman: by buying his freedom, by having his name inscribed in the public registers, by sale or donation to certain temples, by proclamation in the theater, law court, or other public place, or by being freely emancipated by his master. The condition of the Helots of Laconia was peculiar. They were owned by the State, which gave their services to individuals. The domestic servants of Sparta were all Helots, who were generally serfs, living in country villages and cultivating the land of their masters. They had homes, wives, and families; could acquire property, and could not be sold out of the country. They were employed in public works, and also served as light-armed troops in war. They were never trusted by the Spartans, and on one occasion two thousand Helots, who had distinguished themselves by their courage on the battle-field, were foully massacred.

Classic Period.

But it was in Rome that slavery found its most natural and relatively legitimate state—Rome in its later rather than in its earlier days, when the farmer and his slave worked in the field side by side. But the growth of wealth through conquest created a demand for slave labor, and separated the owners from the necessity to labor. Immense numbers of slaves were sold after every war. Cæsar on one occasion in Gaul sold 63,000; and in Epirus 150,000 were sold by Paulus after his victory. By the Jewish war the Romans acquired 97,000 slaves, besides slaughtering thousands in the arena. The Roman writers speak of some masters who possessed 400 slaves, and of one who owned as many as 4116. Blair fixes the proportion of slaves to freemen as three to one in the Roman world. According to this calculation there would have been in Italy, in the reign of Claudius, 6,944,000 freemen and 20,832,000 slaves. The original Roman law allowed the master the power of life and death over his slaves; he was an absolute and irresponsible despot. The slave could not legally possess property, though in practise he was often permitted to enjoy and even accumulate chance earnings. Slave marriage was tolerated without being made legal; and thus a slave was not deemed capable of the crime of adultery. By general sanction and custom, however, the marriage relation was strength-

ened, and the names of husband and wife were commonly used in reference to slaves. For committing any state offense they were punished with death. In law they could not be examined as witnesses, except by torture. An accused slave could not invoke the aid of the tribunes; nor could he accuse his master except on the gravest crimes.

As to their treatment, many Romans favored a certain familiarity and friendliness of intercourse with their bondmen, but not such as to diminish the profit derived from their labor. The wide extent of the rural estates rendered personal knowledge or oversight of the slaves difficult, and by degrees chains came to be used, worn day and night. Even in private houses the porter was chained near the door. The master had his domestic favorites, and sometimes the attachment was one of mutual affection. During the wars slaves showed in noted instances the most noble and devoted fidelity to their owners. The bondmen who were outside the household had, however, the greater freedom of action.

In the mines, where slaves were sent by speculators, men and women worked half naked, in chains, and goaded by the curse and lash of overseers. Cato advised the farm lords to get rid of their old oxen and old slaves, as well as of their sick ones. Sick slaves were commonly exposed on an island in the Tiber. In the arena slaves were exposed to every torture and indignity that the devilish invention of their conquerors could devise. To furnish an hour's amusement to the titled aristocrats and languid idlers of "society," they were torn and mangled into bloody shapelessness by wild beasts from Africa, and compelled to stab, hack, strangle, and disembowel each other. No one has fully written, or will ever write, their sufferings. Slaves are not historians, and those whose scanty and unsympathetic chronicles comprise our only information saw little in their system of bondage to deplore. As compared with Greece, Rome provided greater facilities of emancipation. "No Roman slave," says Blair, "needed to despair of becoming both a freeman and a citizen." It was often a pecuniary advantage to the master to liberate his slave; he obtained a payment which enabled him to purchase a substitute, and at the same time gained a client.

But it is not until the second century of the Christian era that we notice a marked change with respect to the institution of slavery, not only in sentiment but in law as well. The victory of moral ideas became apparent. Dio Chrysostom, the adviser of Trajan, is the first Greek writer who has pronounced the principle of slavery to be contrary to the law of nature. When Rome felt that industrial was soon to succeed military activity, it gradually prepared the way for the abolition of slavery by honoring the freedmen, by facilitating manumissions, and by protecting the slave from his master. Diocletian forbade a free man to sell himself. Man-stealers were punished with death. The insolvent debtor was withdrawn from the power of the creditor. The atrocious mutilation of boys and young men was stopped. Hadrian abolished the underground prisons

and took away from the masters the power of life and death. In the reign of Nero magistrates had been instructed to hear the complaint of an ill-treated slave. Marcus Aurelius brought the relations between master and slave more directly under the control of law and public opinion; and while a slave's oath could not be taken, he was allowed to speak.

While the Christian church did not at once denounce slavery as a social crime; while it recognized the institution, and allowed ecclesiastics to own slaves, it created sentiments favorable to their humane treatment, and planted the seeds from which emancipation finally sprang. (See CHURCH AND SOCIAL REFORM.)

Gradually the slave came to be regarded as merely a servant tied to the soil, *i. e.*, a serf. (See FEUDALISM.) The early forms of serfdom differed little from mild slavery, but by degrees improved, till at last serfdom itself disappeared. Yet, soon after this, the new system of colonial slavery appears, which was no necessary stage of human development, but a monstrous moral, political, and social aberration, which resulted in nothing but evil. In 1442 the Portuguese began to trade in slaves, fitting out a number of ships, and building forts on the African coast. After the discovery of America, Columbus proposed an exchange of his Carib prisoners for live stock. He urged that by this exchange infidels would be converted, the royal treasury enriched by a duty on Caribs, and the colonists supplied with live stock free of expense. In 1494 he sent home 500 Indian prisoners; but Isabella humanely ordered them to be sent back. The bishop of Chiapa, to protect the Indians from cruelty, advised the importation of negro slaves into the Spanish colonies, and his advice was unfortunately adopted. Some Genoese merchants bought the right of supplying America with negroes, and thus began that odious commerce between Africa and America, which increased to such an amazing extent.

Captain John Hawkins was the first Englishman who engaged in the hateful traffic, tho for a long time the English traders supplied only the Spanish settlements with slaves. In 1620

Modern Times.

slavery began in Jamestown, Va., among the tobacco planters. It increased rapidly until, in 1790, the State of Virginia alone contained 200,000 negroes. For a long time the British slave-trade was in the hands of exclusive companies, but by an act of the first year of William and Mary it became free and open to all. Between 1680 and 1700 about 140,000 negroes were exported by the African Company, and 160,000 more by private adventurers. The total import, from 1680 to 1786, into all British Colonies in America, has been estimated at 2,130,000. Shortly before the War of Independence the British slave-trade reached its utmost extension, the number of slave-ships being at least 192. During the war the trade decreased, but revived at its termination. More than half the trade was at this time in British hands. The demand for

slaves by European colonies reduced the tribes of the African sea-coast to a pitiable condition. All that was shocking in the barbarism of the savage was multiplied and intensified by the horrors of the traffic. There was the utmost recklessness of human life, and indifference to misery and torture. The mode of capturing slaves killed its thousands; and the middle passage its tens of thousands.

Exclusive of the slaves who died before they sailed from Africa, 12½ per cent. were lost during their passage to the West Indies; at Jamaica 4½ per cent. died while in the harbors or before the sale, and one-third more in the "seasoning." Thus, out of every lot of 100 shipped from Africa, 17 died in about nine weeks, and not more than 50 lived to be effective laborers in the islands. The circumstances of their subsequent life on the plantations were not favorable to the increase of their numbers. In Jamaica there were, in 1690, 40,000; from that year till 1820 there were imported 800,000; yet at the latter date there were only 340,000 in the island.

But when, in the latter part of the seventeenth century, the nature of the slave-trade began to be understood, all that was best in Great Britain was shocked at its atrocities.

The honor of taking the first practical action against slavery belongs to the Quakers, and especially to their founder—George Fox.

In 1727 they declared it to be "not a commendable or allowed" practise; in 1761 they excluded from their society all who should be found concerned in it, and issued appeals to their members and the public against the system. In 1783 there was formed among them an association "for the relief and liberation of the negro slaves in the West Indies, and for the discouragement of the slave-trade on the coast of Africa." This was the first society established in England for the purpose. The Quakers in America had taken action on the subject still earlier than those in England. (For America, see ABOLITIONISTS.)

In 1787 a committee for the abolition of the slave-trade was formed, with Granville Sharp as president, and after 20 years of persistent labor it met with complete success. On March 25, 1807, a bill was passed which enacted that no vessel should depart for slaves from any port within the British dominions after May 1, 1807; and that no slave should be landed in the colonies after March 1, 1808.

As to France, the abolition of its slave-trade was preceded by stormy struggles and deplorable excesses. The French law was, with regard to the treatment of slaves, humane in its general spirit, but was habitually disregarded by the planters. In 1788 a society was formed in Paris under the presidency of Condorcet, which aimed to suppress slavery itself. The motive and impulse of this movement were not avowedly Christian, as in England; but its cause was rather the enthusiasm for humanity which pervaded France during the Revolutionary period. In spite of the "Declaration of the Rights of Man" in August, 1789, the French system of negro slavery continued. St. Domingo or Hayti was the chief French colony employing slaves.

In 1791 there were 480,000 blacks, 24,000 mulattoes, and only 30,000 whites. In August of this year a rebellion of the negroes broke out, marked by brutal excesses on both sides. For years it raged with varying success, until in 1798 the negroes, under Toussaint l'Ouverture, secured entire possession of the government. This African liberator has been called the noblest type ever produced by the negro race. Slavery was abolished, and the whole population began to rise in civilization and comfort. In 1825 the independence of the island was formally recognized by France; and thus the negro race obtained its first independent settlement outside of Africa.

To Denmark belongs the honor of first abolishing the slave-trade, which it did by a royal prohibition on May 16, 1792. In 1794 the United States first forbade American citizens to participate in the foreign trade in slaves; and in 1808 an act came into force which prohibited the importation of slaves. It was provided at the Vienna congress that the trade should be abolished as soon as possible. As soon as the English slave-trade was stopped, several circumstances combined to greatly increase the traffic and aggravate its evils.

In consequence of the activity of the British cruisers the traders made great efforts to carry as many slaves as possible in every voyage, and practised atrocities to get rid of the slaves when capture was imminent. It was, besides, the interest of the cruisers, who shared the price of the captured slave-ship, rather to allow the slaves to be taken on board than to prevent their being shipped at all. Thrice as great a number of negroes as before, it was said, was exported from Africa, and two-thirds of these were murdered on the high seas. It was found also that the abolition of the British slave-trade did not lead to an improved treatment of the negroes in the West Indies. The slaves were overworked now that fresh supplies were stopped, and their numbers rapidly decreased.

It became increasingly evident that the evil could be prevented only by total prohibition of the whole traffic. The conscience of the nations began to awaken; and the lawfulness of slavery became a matter of discussion. Buxton, in response to

Abolition.

an appeal from Wilberforce, moved, in 1823, that the House should consider the state of slavery in British colonies. His project was one of gradual abolition, by introducing a kind of serfdom, and freeing the children of the slaves. Although the struggle was continued by many noble and able men, it made little progress until 1828, when free negroes were placed on a footing of legal equality with the whites. Two years later, the British public aroused itself at last; and in 1833 Earl Grey carried a motion through the House for complete abolition. This received the royal assent August 28. A sum of \$100,000,000 was voted as compensation to the planters; and a system of apprenticeship for seven years established as a transitional preparation for liberty. All children under six years of age were to be

at once free, and provision made for their instruction. Immediate liberation was carried out in Antigua, and public tranquillity was never so unbroken as during the following year. This led to the shortening of the transition period in the other colonies, and gave freedom to all the slaves in August, 1838.

The other European States one by one followed this example; France in 1848, and the Dutch in 1863. After this last date, there still remained three countries in which the slave system was still undisturbed—Brazil, Cuba, and the United States. The fathers of the American States were by no means defenders of slavery. Washington provided in his will for the emancipation of his slaves, and said to Jefferson that it was among his first wishes to see some plan adopted by which slavery in his country might be abolished by law. John Adams declared his abhorrence of the system; while Franklin, Madison, Hamilton, and Patrick Henry reprobated the principle of it. Jefferson declared that in the presence of the institution he trembled for his country, when he remembered that God was just. In the Constitution which was drawn up at Philadelphia, 1787, the sentiments of the framers were against slavery; but through the insistence of Georgia and South Carolina, it was recognized. The words "slave" and "slavery," though, were excluded from the Constitution, because, as Madison explained, they did not choose to admit the right of property in man, *in direct terms*. Soon after the Union was formed the Northern States, beginning with Vermont, either abolished slavery or adopted measures that led to abolition; but this simply transferred the slaves to the markets of the South. Step by step the slave power for a long time increased in influence.

The acquisition of Louisiana—including the State so named, Arkansas, Missouri, and Kansas—(1803), though not made in its interest; the Missouri compromise (1820), the annexation of Texas (1845), the Fugitive Slave Law (1850), the Kansas-Nebraska bill (1854), the Dred Scott decision (1856), the attempts to acquire Cuba (1854) and to reopen the foreign slave-trade (1859-60), were the principal steps—only some of them successful—in its career of aggression. They roused a determined spirit of opposition, founded on deep-seated convictions. The pioneer of the more recent abolitionist movement was Benjamin Lundy. He was followed by William Lloyd Garrison, Elijah P. Lovejoy, Wendell Phillips, Charles Sumner, John Brown, all of whom were in their several ways leading apostles or promoters of the cause. The best intellect of America outside the region of practical politics has been on the anti-slavery side. William E. Channing, R. W. Emerson, the poets Bryant, Longfellow, pre-eminently Whittier, and more recently Whitman, have spoken on this theme with no uncertain sound. The South, and its partisans in the North, made desperate efforts to prevent the free expression of opinion respecting the institution, and even the Christian churches in the slave States used their influence in favor of the maintenance of slavery. But in spite of every such

effort opinion steadily grew. (See ABOLITIONISTS.)

Mrs. Harriet Beecher Stowe (*q. v.*) in her *Uncle Tom's Cabin*, deeply stirred the public sentiment of the North against slavery. Finally it became evident that the question could not be settled without an armed conflict. When Abraham Lincoln was made President in November, 1860, this was the signal for the rising of the South. While the North took up arms at first simply to maintain the Union, it was soon recognized that the real issue of the conflict was the life or death of the slave system. In 1862 the slave system of the Territories was abolished by Congress; three years later the war closed; and on January 1, 1863, Lincoln issued his proclamation of freedom. A constitutional amendment was passed in 1865 abolishing and forever prohibiting slavery throughout the United States.

In Brazil there were, in 1835, 2,100,000 slaves. In 1880 Joachim Nabuco, the leader of the anti-slavery movement, introduced a bill for the more rapid liberation of slaves, and for the final extinction of slavery in Brazil by January 1, 1890. This plan was carried into effect.

In Russia the original rural population consisted of slaves, free agricultural laborers, and peasants proper. Czar Paul (1796-1801) commanded that serfs should work for their masters only three days a week; but no decisive measures were taken until the reign of Alexander II. (1858). That emperor set a plan in motion which resulted in the abolition of serfdom in March, 1861. (See RUSSIA.)

Slavery, as it exists in the Mohammedan East, is not of the field, but of the household.

Slaves are treated as members of the family, with tenderness and affection. The Koran teaches kindness and sympathy, and encourages manumissions. But, standing behind this comparatively mild and humane bondage, is the slave-trade with all its cruelties. Turkey has frequently declared slavery to be illegal, but has been too lax and nerveless to enforce its declarations.

The principal centers from which slaves are now furnished to Egypt, Persia, Turkey, and Arabia are three in number: (1) The Soudan, south of the Great Desert, seems to be yet a vast hunting-ground; 10,000 annually are marched to Fezzan, enduring unimaginable sufferings. The desert highways are white with their bones. The total number of slaves in Morocco is about 50,000. (2) The basin of the Nile, extending toward the great lakes. Sir Samuel Baker and Colonel Gordon checked the traffic here for a while, but since the Soudan revolt slave-capturing has flourished almost unmolested. (3) The Portuguese possessions on the East African coast. The Portuguese appear to be the most determined upholders of the system, and are intensely hated by the natives. In 1880 it was estimated that about 3000 slaves were exported annually from this region.

Both Clarkson and Buxton realized that the only effectual preventive of slavery would be the establishment in Africa of legitimate com-

merce. It was hoped that Sierra Leone and Liberia would serve this purpose; but they have not been successes in that line. In September, 1876, King Leopold of Belgium called a conference of geographers to consider the question of the exploration and civilization of Africa by means of commerce, and the abolition of the slave-trade. An International African Association was formed, six European nations being represented. Various expeditions have been made through the inland districts, the most notable being that of Stanley along the Congo. The Congo Free State was formed. In 1884 an international conference held at Berlin declared that "these regions shall not be used as markets or routes of transit for the trade in slaves, no matter of what race; we bind ourselves to put an end to this trade and punish those engaged in it." The population of the Congo Free State is estimated at 42,608,000. Stations have been built at points extending for 1500 miles inland. This plan of operations has its advantages and its dangers. Disputes and jealousies may arise between the various powers concerned; and the greed of commerce may strangle Africa with its new forms of oppression. However, the enterprise appears to have begun with a pure and benevolent motive, and may succeed in removing some of the evils under which the negroes have suffered. The agitation of the questions by Cardinal Lavigerie, and the establishment in the Sahara of the Soldier Monks of the Sahara to put down the slave-trade and rescue slaves, are well known. In 1890 a general act was agreed upon by all parties (including Turkey, Persia, Congo Free State, and Zanzibar, with the United States and all the greater European powers) on the following programme:

- (1) A civilized protectorate over the administration of the African territories.
- (2) The establishment of strong stations by each power in its own territory to repress slave-hunting.
- (3, 4, 5) The development of Central Africa by roads, railways, steamboats, with fortified posts and telegraphs.
- (6) The organization of expeditions and flying columns to protect them and support repressive action
- (7) The restriction of the importation of modern firearms and ammunition through the slave-trade territory.

On the Indian Ocean and along Madagascar the powers also agreed to put down slave-trading in small vessels.

H. N. CASSON.

SLIDING SCALE.—Wages are said to be on a "sliding scale" when an agreement is made between an employer and employees that the wages shall rise and fall with selling prices in the trade concerned. This form of wage agreement has been considerably favored by some of the older and stronger trade-unions of

England and America, particularly in the mining and iron and steel trades. It was long ago adopted by the Amalgamated Association of Iron and Steel Workers (*q. v.*), and has often prevented wage disputes. It has not, however, proved itself perfectly satisfactory, because there is nothing to prevent prices going so low as to carry wages below the living point. Hence the agitation for the "Minimum Wage" (*q. v.*).

SLUMS.—The word slum (probably a corruption from *slump*, a swamp) is a name loosely given to dirty back streets or alleys occupied by the poor and wretched, and often by criminals or semi-criminals. There is no clear line between slums and poor tenements, and the problem, therefore, of the housing of the poor we consider under **TENEMENTS**. We here merely condense a few statistics reported by the United States Commissioner of Labor in his seventh special Report, 1894, and based upon a special investigation authorized by Congress in 1892. The investigation was confined to four cities—Baltimore, Chicago, New York, and Philadelphia—and in each of these cities no attempt was made to cover the whole of the population living in the slums, but only those living in certain districts. These were in number, April 1, 1893: In Baltimore, 18,048; in Chicago, 19,748; in New York, 28,996; in Philadelphia, 17,060; making the total of individuals covered by the investigation, 83,852. "According to the best estimates," says the Report (p. 12), "the total slum population of Baltimore is about 25,000; of Chicago, 162,000; of New York, 360,000; of Philadelphia, 35,000. The districts selected are among the worst in the cities, and may be denominated as the center of the slum population."

We give first what are called in the Report itself general results of the investigation. Says the Report (pp. 14, 15, and 17):

"In the city of New York there was, at the time of the investigation, one liquor saloon to every 200 persons; but in the slum district canvassed there was one saloon to every 129 persons. In Philadelphia, in the city at large, there was one liquor saloon to every 870 persons; but in the slum district canvassed there was one such saloon to every 502 persons. In Baltimore, in the city at large, there was one saloon to every 229 persons; but in the slum district canvassed there was one saloon to every 105 persons. In Chicago, in the city at large, there was one saloon to every 212 persons, while in the slum district canvassed there was one saloon to every 127 persons.

In the year 1893 (that in which the investigation under consideration was made) there was in the whole city of Baltimore one arrest to every 14 persons, while in the eastern police district, with a population of 51,767 at the United States census of 1890, there was one arrest to every 9 persons. In Chicago, in the city at large, there was one arrest to every 11 persons, while in

General Conditions.

the second and twenty-first police precincts, with a population of 117,503 at the United States census of 1890, there was one arrest to every 4 persons. In New York, in the city at large, there was one arrest to every 18 persons, while in the sixth and tenth police precincts, with a population of 52,130 at the United States census of 1890, there was one arrest to every 6 persons. In Philadelphia, in the city at large, there was one arrest to every 18 persons, while in the second police district, with a population of 71,872 at the United States census of 1890, there was one arrest to every 13 persons.

"The total foreign-born in the city of Baltimore is 15.88 per cent. of the total population, but in the slum

district canvassed it is 40.21 per cent.; in Chicago, the total foreign born in the city at large constitutes 40.98 per cent. of the total population, while in the slum district it is 57.51 per cent.; in New York, the foreign born is 42.23 per cent. of the total population, while in the slum districts it is 62.58 per cent.; and in Philadelphia, the foreign-born constitutes 25.74 per cent. of the total population and 60.45 per cent. of the slum population (p. 18).

"The proportion of the persons who live in the slums, who are illiterates, is also exceedingly suggestive." [As used in the report, the word 'illiterate' is used for those ten years old or over who neither read nor write English or any other language, embracing also the very small number who can read but cannot write.] (*Report*, p. 50.)

"In the whole city of Baltimore the illiterates are 9.79 per cent. of the population; in the slum districts they are 19.60. In the whole city of Chicago the illiterates are 4.63 per cent. of the population; in the slum districts they are 25.37. In the whole city of New York the illiterates are 7.27 per cent. of the population; in the slum districts they are 46.5. In the whole city of Philadelphia the illiterates are 4.97 per cent. of the population; in the slum districts they are 37.07. (*Report*, p. 18.)

"In addition, there is a large proportion of the population who are not classed among illiterates, because they can read or write their own language, who yet cannot read or write English. The proportion of these to the entire slum population is, in Baltimore, 18.72 per cent.; in Chicago, 22.19 per cent.; in New York, 16.51 per cent.; in Philadelphia, 13.58 per cent."

As to the earnings of the slum population the conclusion reached is as follows:

"The earnings of the people living in the slum districts canvassed are quite up to the average earnings of the people generally. (*Report*, p. 19.)

"In the slum districts canvassed in Baltimore it is found that 7441 persons were engaged in remunerative occupations, and that the average weekly earnings per individual were \$8.65½. In Chicago 8,483 persons earned on an average \$9.88½ each per week. In New York 12,434 persons earned on an average \$8.36 each per week. In Philadelphia 7257 persons earned on an average \$8.68 each per week. As has been shown already on p. 53 (of the Report), those engaged in remunerative occupations in the several cities constitute the following proportions of the total population of the slum districts canvassed: Baltimore, 41.23; Chicago, 42.96; New York, 42.83, and Philadelphia, 42.54.

Wages.

"Reducing the average weekly earnings to the basis of earnings per family per week, it is found that in the slum district canvassed in Baltimore, 4028 families earned on an average \$15.99 each per week; in Chicago, 3881 families, \$21.60½ each; in New York, 5912 families, \$17.58 each; in Philadelphia, 3313 families, \$19.01½ each. These figures, it should be borne in mind, are for the whole number of families in the slum districts canvassed.

"Now for the weekly average of hours that these workers labored to get these earnings.

"From the summary relating to the hours of labor, it is seen that the average hours of labor per week for the persons in the district canvassed were, in Baltimore, 64.21; in Chicago, 60.94; in New York, 62.55, and in Philadelphia, 62.47. The average hours for the males and females differ very slightly, except in New York, where the average for males is 63.65, and for females, 58.86. In each city by far the greatest number is found in the class working 60, or under 66 hours per week. A large number is found in the classes working less than 60 hours per week, while the number in the class working the longest hours, 90 or over per week, is considerable. (*Report*, p. 64.)

"The question of earnings should always be considered in connection with the amount of annual employment. On p. 66 of the Report is given a short summary of the number of workers in the slums out of employment and the number of months they averaged out of employment; no notice being taken of workers under 15 years of age, or of workers who were out of employment less than a half month. The inquiry concerned the year ending March 31, 1893—a year, it will noted, of what might fairly be called prosperous times. From this table we find that in Baltimore 1564 workers were out of employment an average of 3.6 months. In Chicago 315 were out of employment an average of 3.1 months. In New York 2615

persons were out of employment an average of 3.1 months. In Philadelphia 2591 persons were out of employment an average of 2.9 months.

To say nothing of individual cases of hardship, it will be seen at once that this unemployment constitutes a considerable reduction in the average earnings. The amount actually lost is probably considerably in excess of this, as the loss is on the wages of the workers who are in every case over 15 years of age, and takes no account of any other loss except that specified.

"But, reckoning for only this reduction, it brings the average weekly earnings of the slum family in New York to \$16.66, which, as the family averages (p. 44 of the Report) 4.09 persons, means \$3.40 for each person; and in Chicago it brings the average weekly earnings of the slum family to \$10.67, which, as the family averages 5.09 persons, means \$3.85 for each person."

The results reached by the investigation as to the health of those living in the slum districts are at once surprising and gratifying. Says the Report (p. 19):

"The agents and experts employed in this investigation were nearly unanimous in the opinions they expressed relative to the health of the people of the slum districts. It should be remembered that this investigation

Hygiene.

was conducted in the most thorough census manner; each and every house and every tenement in every house being visited and the facts taken down for each and every individual living in the slum districts. The testimony of the agents, therefore, relative to general conditions is most valuable. The statistics drawn from the schedule replies show no greater sickness prevailing in the districts canvassed than in other parts of the cities involved, and while the most wretched conditions were found here and there, the small number of sick people discovered was a surprise to the canvassers. It may be that owing to the time of year (late spring) the people were living with open windows, and thus not subjected to the foul air which might be found in the winter."

The Report says (p. 100):

"The extraordinary freedom from sickness in the slums of New York reflects great credit on the health board of that city."

Since this statement was made the Report of the Tenement-house Committee, as transmitted to the Legislature of the State of New York, has thrown additional light upon the case, and shows in how large a degree the gratifying results reached are owing to the Board of Health of that city. We quote from this Report (p. 36):

	1865-1874.	1875-1884.	1885-1864.
Average population....	833,335	1,202,945	1,685,094
Average annual deaths,	27,047	31,894	40,557
Average annual death rate.....	30.27	26.51	24.07

"The total deaths for 1894 were 41,175, giving a death rate of 21.03 upon an estimated population of 1,957,452.

"The figures relating to the number of families or individuals, classified by rooms, are very important. In Baltimore 530 families, or 13.16 per cent., consisting of 1648 individuals, are living in one room, with an average of 3.15 persons to a room. In Philadelphia 49 families, or 12.10 per cent., are living in one room, with an average of 3.11 persons to each room. In this point these towns are worse than both Chicago and New York. The percentage of families living in two rooms is different. Here New York comes first, with 44.55 per cent.; Baltimore, 27.83 per cent.; Philadelphia, 43.41 per cent.; and Chicago, 19.14 per cent. In Philadelphia 53.01 per cent. of all families live in houses of one tenement, or, in other words, occupy the whole house; Baltimore follows with 36.25 per cent. of families; Chicago with 9.53 per cent., while in New York only 1.84 per cent. of families have a house to themselves. The number of persons to a dwelling for each of the four cities as a whole, by the United States census, is: Philadelphia, 5.60; Baltimore, 6.02; Chicago, 8.60; New York, 18.52 persons. The figures for the slum districts are invariably larger: Philadelphia, 7.34; Baltimore, 7.71; Chicago, 15.51; New York, 36.70. Another table shows the number of occupants of sleeping-rooms, and the cubic feet of air-space per individual, and the number of outside windows. As regards this last point, 25 persons in Baltimore had no outside win-

dow in their sleeping-room, and two of these rooms had six occupants; in Philadelphia, 49 persons; in Chicago, 811 persons. Three of these windowless rooms in this last city had ten, nine, and eight occupants respectively. In New York, 657 persons, out of a total of 28,050, are reported as sleeping in rooms without an outside window; the majority of the rooms containing two or three occupants. The great mass of the remaining people in the four cities sleep in rooms with one or two outside windows, and two occupants to a room is most frequent. In the matter of air-space, New York takes the lowest place. There 5811 persons have under 200 feet, 6517 under 300 feet, and 4639 under 400 feet, out of 28,050 persons. This is in spite of the strenuous efforts of the Board of Health to obtain at least 400 feet for every individual, though 600 feet is considered the desirable space for an adult. In Chicago, also, the great majority have less than 400 cubic feet, but in Baltimore and Philadelphia the great mass of people have between 300 feet and 600 feet."

P. W. SPRAGUE.

SMITH, ADAM, was born at Kirkcaldy in 1723, the son of Adam Smith, comptroller of the customs. Of a weak constitution he was carefully reared by a devoted mother. Studying in the local school he showed a great fondness for books. In 1837 he went to Glasgow University where he attended the lectures of Dr. Hutcheson, and in 1740 went to Balliol College, Oxford, with a view to taking orders in the English Church. Returning, however, to Kirkcaldy for two years, he went to Edinburgh in 1748, and lectured on belles-letters under the patronage of Lord Kames, and forming the friendship of David Hume. In 1851 he became professor of logic at Glasgow, and in 1852 professor of moral philosophy. His first work as an author were two articles in 1755 in the *Edinburgh Review* of that period. In 1759 appeared his *Theory of Moral Sentiments*. In 1762 he was made doctor of laws, and in 1763 he took charge of the young Duke of Buccleuch on his travels. He spent nearly two years in south France, and in a short time in Paris met the brilliant writers there. In 1766 he returned to England, and for ten years lived at Kirkcaldy with his mother, working on his great work, *An Inquiry into the Nature and Causes of the Wealth of Nations*, which appeared in 1776. (Concerning its teachings and Adam Smith's economic position, see POLITICAL ECONOMY.) The next two years were spent in London in literary society, but in 1778 he was appointed one of the commissioners of customs in Scotland, and fixed his residence in Edinburgh. In 1787 he was elected lord rector of the university of Glasgow, but his health gradually failing he died, after a painful illness, in 1790.

(See POLITICAL ECONOMY.)

SMITH, RICHMOND MAYO, was born in Troy, O., in 1854. He was graduated at Amherst College in 1875, and studied at the universities of Berlin and Heidelberg, 1875-77. He was assistant teacher of history in Columbia College, 1877-78; adjunct professor, 1877-83, and since 1883 professor of political economy and social science. He has published *Statistics and Economics* (1888); *Emigration and Immigration* (1890); *Statistics and Sociology* (Part I., 1896).

SOCIAL CONTRACT.—According to J. J. Rousseau (*q. v.*), a State is founded by a "social contract" between its members, whereby they, tho' formerly living in a "state of nature" without laws, agree for their mutual good to form themselves into a social body and obey its constituted laws. His theory is a development of the teachings of Hobbes, Locke, and early thinkers, and is therefore best discussed in connection with other views. (See ARTICLES NATURAL RIGHTS; POLITICAL SCIENCE; ROUSSEAU; STATE.)

SOCIAL-DEMOCRATIC FEDERATION, THE (English), was founded in London in 1881, under the name of the Democratic Federation, and through the efforts of H. M. Hyndman (*q. v.*), Herbert Burrow, Miss Helen Taylor (step-daughter of J. S. Mill) and others. In 1884 it became an avowed socialist body and took its present name. It entered at once upon strenuous agitations, and was prominent in the agitation of 1886, with the so-called Trafalgar Square demonstrations, etc. To-day it has small but enthusiastic branches in all the prominent English cities and centers of trade. William Morris, and a few others at first connected with it, left it, however, in 1885 to form a Socialist League, on the lines of a more communal and less parliamentary conception of socialism. John Burns, Tom Mann, and others have also left it because of the policy of the Federation in antagonizing all trade-union and political agitation not avowedly connected with, and politically supporting its type of Marxist socialism. Its leading spirit from the first has been H. M. Hyndman. Its organ is *Justice*, long under the editorship of Henry Quelch (*q. v.*), and published at 37A Clerkenwell Green, E. C., London. It has of late years nominated many political candidates, but has polled but a small vote, since it refuses to work with the Independent Labor Party or any other reform party, believing that it alone stands for the socialism which can save England. Its present platform is as follows:

"*Object.*—The common or collective ownership of the means of production, distribution, and exchange, to be controlled by a democratic State in the interests of the entire community, and the complete emancipation of labor from the domination of capitalism and landlordism, with the establishment of social and economic equality between the sexes.

"*Program.*—I. All organizers or administrators to be elected by equal direct adult suffrage, and to be maintained by the community.

"II. Legislation by the people in such wise that no project of law shall become binding till accepted by the majority of the people.

"III. The abolition of a standing army, and the establishment of a national citizen force; the people to decide on peace or war.

"IV. All education, higher no less than elementary, to be compulsory, secular, industrial, and gratuitous for all alike.

"V. The administration of justice to be free to all.

"VI. The means of production, distribution, and exchange, including the land, to be declared and treated as collective or common property.

"VII. The production and distribution of wealth to be regulated by the community in the common interests of all its members.

"*Palliatives.*—As measures called for to palliate the evils of our existing society, the Social-Democratic Federation urges for immediate adoption: The compulsory construction of healthy dwellings for the people; such dwellings to be let at rents to cover the cost

of construction and maintenance alone. Free secular and technical education, compulsory upon all classes, together with free maintenance for the children in all State schools. No child to be employed in any trade or occupation until 16 years of age, and heavy penalties to be inflicted on employers infringing this law. Eight hours or less to be the normal working-day fixed in all trades and industries by legislative enactment, or not more than 48 hours per week, penalties to be inflicted for any infringement of this law. Cumulative taxation upon all incomes exceeding £300 a year. State appropriation of railways, municipal ownership and control of gas, electric light, and water supplies; the organization of tramway and omnibus services and similar monopolies in the interests of the entire community. The extension of the post-office banks so that they shall absorb all private institutions that derive a profit from operations in money or credit. Repudiation of the National debt. Nationalization of the land, and organization of agricultural and industrial armies under State or municipal control on cooperative principles.

"As means for the peaceable attainment of these objects, the Social-Democratic Federation advocates: Payment of Members of Parliament and of all local bodies. Payment of official expenses of elections out of the public funds. Adult suffrage. Annual Parliaments. Proportional representation. Second ballot. Abolition of the monarchy and the House of Lords. Disestablishment and disendowment of all State churches. Extension of the powers of county, town, and district councils. The establishment of adequate pensions for the aged and infirm. Every person attaining the age of 50 to be kept by the community, work being optional after that age. The establishment of municipal hospitals, municipal control of the food and coal supply. Abolition of the present work-house system, and the provision of useful work for the unemployed. State control of the lifeboat service. Legislative independence for all parts of the empire."

SOCIALISM (from Latin *socius*, a comrade, an associate) is a word first used in connection with the later agitation of Robert Owen from 1830-40, and first popularized in Reybaud's *Études sur les Réformateurs ou Socialistes Modernes* (1840), to express the general tendency to develop a communal or cooperative organization of society in place of the existing competitive state of society. The word, however, in the evolution of social reform, has come—at least in Germany, England, and the United States—to be limited in general use to that effort for the cooperative organization of society which would work through government (national, State, or local). This is by no means to identify socialism with a mere expansion of the functions of the State, no matter what the State is. Socialists only believe in the *fraternal* State. Paternal State socialism all socialists unanimously oppose, save as possibly they may induce existing paternal governments to introduce measures leading toward fraternal social cooperation. In Germany, where the government is essentially paternal, the phrase State socialism is used for the expansion of its paternal functions, and is strenuously opposed by the socialists. In the United States and England, where the ideal of government is democratic, socialists usually declare themselves State socialists. Says a report issued in 1896 by the Fabian (socialist) Society of London (see FABIAN SOCIETY):

"The socialism advocated by the Fabian society is State socialism exclusively. The foreign friends of the Fabian society must interpret this declaration in view of the fact that since England now possesses an elaborate democratic State machinery, graduated from the Parish Council or vestry up to the central

Parliament, and elected under a franchise which enables the working-class vote to overwhelm all others, the opposition which exists in the Continental monarchies between the State and the people does not hamper English socialists. For example, the distinction made between State socialism and social democracy in Germany, where the municipalities and other local bodies are closed against the working-classes, has no meaning in England."

I. DEFINITIONS.

By the derivation of the word, by its history, by its use by socialists themselves, socialism is the very opposite of paternalism. All great socialists have been democrats and have opposed paternalism. Owen, Fourier, Blanc, Marx, Engels, Lassalle, Kingsley, Maurice, Hyndman, Morris—where is there a governmental paternalist among the great socialists? In Germany the socialists invariably vote against the State insurance schemes of the imperial government; in France the socialists favor the maintenance for the present of peasant proprietorship, fearing that till the government becomes thoroughly socialized, to nationalize land would give the government too much power.

This is so much the case that, down to about 1880, the word socialism was commonly used, everywhere, and in Continental Europe outside of Germany, is still often used, to cover all efforts for a cooperative organization of society, to be developed through the State or otherwise. But beginning mainly with the teachings of Karl Marx, who based his idea on the evolutionary doctrine of the century, socialism has become, as above stated, in Germany, England, and the United States, a term usually limited to the conception of a cooperative commonwealth to be evolved out of and through existing government, and this idea is growing everywhere through Europe.

With this general conception of socialism, one may see how modern socialism is neither on the one hand a vague dream of a millennium of love, nor, on the other hand, a cast-iron paternal system of society.

Friedrich Engels says (*Die Entwicklung des Sozialismus von der Utopie zur Wissenschaft*):

"The first act in which the State really appears as the representative of society as a whole, namely, the seizure of the means of production in the name of society, is at the same time its last independent act as a State. Interference of the State in social relations gradually becomes superfluous in one department after another, and finally of itself ceases (goes to sleep). The place of government over persons is taken by administration of things and the management of productive processes."

Bebel (*Die Frau und Sozialismus*, pp. 312-314) argues that, under socialism, ministers, parliaments, armies, police, courts, attorneys, taxation, will all disappear, their place being taken by administrative colleges or boards. Nor, on the other hand, can socialism be considered a loose word, used in so many senses that nobody knows what it means. It is, indeed, undoubtedly loosely used by some sentimental would-be friends of socialism and more sensational opponents of socialism; but there is no dispute, among even ordinarily informed people who use words with reasonable care. The modern lexicons, the encyclo-

pedias, the scholars, the authorities, socialists themselves, are all agreed as to what socialism is, as may be shown by the following quotations, which, tho using different phraseologies, are in almost absolute agreement.

Says the *Century Dictionary*:

"Socialism is any theory or system of social organization which would abolish entirely or in great part the individual effort and competition on which modern society rests, and substitute for it cooperative action; would introduce a more perfect and equal distribution of the products of labor, and would make land and capital, as the instruments and means of production, the joint possession of the members of the community."

Says the *Encyclopædia Britannica* (article *Socialism*, by Thomas Kirkup):

"Whereas industry is at the present carried on by private capitalists served by wage labor, it must be in the future conducted by associated or cooperating workmen jointly owning the means of production. On grounds both of theory and history this must be accepted as the cardinal principle of socialism."

Says Professor Schaffle (*Quintessenz des Sozialismus*):

"The Alpha and Omega of socialism is the transformation of private and competing capitals into a united collective capital."

Says Professor Richard T. Ely (*Socialism and Social Reform*, p. 19):

"The results of the analysis of socialism may be brought together in a definition which would read somewhat as follows: *Socialism is that contemplated system of industrial society which proposes the abolition of private property in the great material instruments of production, and the substitution therefor of collective property; and advocates the collective management of production, together with the distribution of social income by society, and private property in the larger proportion of this social income.*"

Coming to those who call themselves socialists, the English Fabian Society (in the above-mentioned *Report*, 1896), says:

"Socialism, as understood by the Fabian Society, means the organization and conduct of the necessary industries of the country, and the appropriation of all forms of economic rent of land and capital, by the nation as a whole, through the most suitable public authorities, parochial, municipal, provincial, or central."

Says the American Fabian Society (tract, *What Socialism Is*):

"Socialism is that mode of social life which, based upon the recognition of the natural brotherhood and unity of mankind, would have land and capital owned by the community collectively, and operated cooperatively for the equal good of all."

Says a recent manifesto of the joint committee of all English socialist bodies:

"Our aim, one and all, is to obtain for the whole community complete ownership and control of the means of transport, the means of manufacture, the mines, and the land. Thus we look to put an end forever to the wage system, to sweep away all distinctions of class, and eventually to establish national and international communism on a sound basis."

Says Friedrich Engels (Marx's lifelong friend and the editor of his literary remains), describing socialism in his *Socialism, Utopian and Scientific*, translated by E. Aveling:

"With the seizing of the means of production by society, production of commodities is done away with, and simultaneously the mastery of the product over the producer. Anarchy in social production is replaced by systematic, definite organization. The struggle for individual existence disappears. . . . The whole sphere of the conditions which environ man, and which have hitherto ruled man, now comes under the dominion and control of man, who now for the first time becomes the real conscious lord of Na-

ture, because he has now become master of his own social organization. . . . It is the ascent of man from the kingdom of necessity to the kingdom of freedom."

Says Paul Lafargue of France, Marx's son-in-law (in *Le Figaro*):

"Socialism is not the system of any reformer whatever; it is the doctrine of those who believe that the existing system is on the eve of a fatal economic evolution which will establish collective ownership in the hands of organizations of workers, in place of the individual ownership of capital. Socialism is of the character, therefore, of an historical discovery."

Says John Stuart Mill (*Fortnightly Review*, April, 1879):

"What is characteristic of socialism is the joint ownership by all the members of the community of the instruments and means of production, which carries with it the consequence that the division of all the produce among the body of owners must be a public act performed according to the rules laid down by the community."

There has been, however, an evolution of the idea of socialism. Mr. Sydney Webb says (*Fabian Essays*, chapter on the "Historic Basis of Socialism"):

"Down to the present generation, the aspirant after social regeneration naturally vindicated the practicability of his ideas by offering an elaborate plan with specifications of a new social order from which all contemporary evils were eliminated. Just as Plato had his Republic, and Sir Thomas More his Utopia, so Babeuf had his Charter of Equality, Cabet his Icaria, St. Simon his Industrial System, and Fourier his ideal Phalanstery. Robert Owen spent a fortune in pressing upon an unbelieving generation his New Moral World; and even Auguste Comte, superior as he was to many of the weaknesses of his time, must needs add a detailed polity to his Philosophy of Positivism."

"The leading feature of all these proposals was what may be called their static character. The ideal society was represented as in perfectly balanced equilibrium, without need or possibility of future organic alteration. Since their day we have learned that social reconstruction must not be gone at in this fashion. Owing mainly to the efforts of Comte, Darwin, and Herbert Spencer, we can no longer think of the ideal society as an unchanging State. The social ideal from being static has become dynamic. The necessity of the constant growth and development of the social organism has become axiomatic."

This shows that many elements sometimes identified in the popular mind with socialism have no necessary connections with it. The *Report* of the Fabian Society above quoted says in its opening paragraph:

"The object of the Fabian Society is to persuade the English people to make their political constitution thoroughly democratic and so to socialize their industries as to make the livelihood of the people entirely independent of private capitalism."

"The Fabian Society endeavors to pursue its socialist and democratic objects with complete singleness of aim. For example:

"It has no distinctive opinions on the marriage question, religion, art, abstract economics, historic evolution, currency, or any other subject than its own special business of practical democracy and socialism."

Professor Schaffle, in his *Quintessence of Socialism*, shows how some socialists may believe in and practise free love—some individualists also do—and that socialism as a system has no necessary connection with loose family relationships. Nor is there more authority for identifying socialism with anarchy. Theoretically, the two are opposites, and practically they are opposed. Socialists indeed rebel against the idea of placing the individual under the power of a despotic government; but so do all democrats. Socialists, like all demo-

crats, conceive of the individual as one member of a fraternal state, who must indeed yield to the will of the majority in public affairs, but who thereby does not lose so much as gain in freedom (see LIBERTY; also STATE); but modern socialists do strenuously oppose all efforts to overturn governments by physical force or to plant the cooperative commonwealth on the ruins of existing institutions. Modern socialism aims, as above asserted, at the law-abiding, political capture of the State, and its gradual evolution into a cooperative commonwealth. To establish this policy among socialists was perhaps the greatest work which Karl Marx accomplished. Up to, and after the organization of the International (*q. v.*) socialism had been identified with communism, and indeed with any form of effort after or theory of a general cooperative civilization. But soon after the organization of the International, two distinct parties were developed within it. One party, led by Bakounin (*q. v.*), sought a communism to be established on the ruins of existing institutions; the other, led by Marx, sought a communism to be established through the evolution of existing institutions. It is to this view that modern socialism has come. The two parties came to a clash in the congress of the International at The Hague in 1872. In that congress the Marxist party won, and since then the socialists and the anarchist communists, as the other party soon learned to call its faith, have never come together. The party led by Bakounin rejected The Hague Congress and established a new International, which they claimed to be the real one, and by their intensity and violence for a while carried the majority of Continental workmen with them, but the futility of their anarchistic methods and their inability to effect abiding organization has gradually led the overwhelming majority of the workers for communism in all countries to declare for the socialist or political method. To-day, socialists oppose all forms of anarchy. Anarchist communism they know to be impractical and foolhardy. Philosophic anarchism they believe to be impractical and false at its root.

Philosophic anarchism starts from the individual, and would allow private property, competition, or aught else that the individual desires and is able to enter into, though it often favors voluntary cooperation in very many directions, and usually opposes private property in land. Socialism starts from the community, and would wholly supplant industrial competition by industrial collectivism, the cooperation of the whole community.

The same development of ideas has made modern socialists oppose ordinary communism (*q. v.*), ordinary local cooperation, and even the establishment of local communistic colonies. Some socialists believe that under existing conditions local experiments in these directions may be wise as temporary means of education or of economic living, and where cooperation has got an established hold, as in England and Belgium, Socialists are learning the wisdom of working with the cooperators (see COOPERATION), but where local cooperation experiments or colonies are put forth as in

themselves a sufficient ideal to work for, or where they are attempted, as often in the United States, under conditions too weak to compete against the competitive civilization with which they are surrounded, socialists oppose such efforts as reactionary and unwise.

Communism would have all things common, and may be developed in little colonies or communities. Socialism puts emphasis, not on life in common, but on conducting industrial production and distribution in common, and aims at development, not through little colonies or independent communities, but by the gradual evolution of the collective life of whole existent and federated communities, such as towns, cities, States, nations, etc.

The above discussion will show how large and evolutionary an ideal modern socialism is. It is as flexible in its form as it is definite in its principle. Any system that would carry out its principle is socialistic. In different countries, and under different conditions, socialism would take very different forms. In Germany to-day its chief aim is national development. In France it makes less of the nation and centers around the commune, or township. In Belgium it comes very near to non-political cooperation, and yet is socialism not cooperation. In England it is municipal, and in a growing degree parliamentary. In Switzerland it centers around the canton. In the United States it will probably follow our national instincts, our political divisions of States, counties, municipalities, townships, and the nation. Socialism, therefore, is not Fourierism, nor Marxism, nor Grondlundism, nor Bellamyism. Says Sidney Webb: "It seems almost impossible to bring people to understand that the abstract word socialism denotes, like radicalism, not an elaborate plan of society, but a principle of social action."

It follows that socialists to-day spend little time in dreaming of the future. To the future the future may be left. Content with a firm grasp on their central principle and willing to sacrifice this for no reactionary policy, or side promises, however alluring, of communistic colonies and cooperative efforts, socialists are learning more and more to concentrate their efforts on the present political battle, and to leave the details of the future to the decision of circumstances. Says, Mr. Kidd, speaking of this policy (*Social Evolution*, p. 206): "We have not now to deal with mere abstract and transcendental theories, but with a clearly defined movement in practical politics, appealing to some of the deepest instincts of a large proportion of the voting population, and professing to provide a program likely in the future to stand more on its own merits in opposition to all other programs whatever."

We now pass to the consideration of

II. THE HISTORY OF SOCIALISM.

This we can consider but in general, leaving the detailed developments to be considered under the articles concerning the respective countries.

(For other information, see articles FABIAN SOCIETY; INDEPENDENT LABOR PARTY; INTER-

NATIONAL; NATIONALISM; SOCIAL-DEMOCRATIC FEDERATION; SOCIALIST LABOR PARTY; also CHRISTIAN SOCIALISM; SOCIALISTS OF THE CHAIR; TRADE-UNIONISM; COOPERATION; MUNICIPALISM; NATIONALIZATION, etc.)

Socialism of the modern type, if a date must be fixed, may be said to have begun in 1817, the year when Robert Owen laid before Parliament his plan for a socialistic community, the year when the speculations of Saint-Simon took a definitely socialistic direction, the year when Lamennais published his first work looking toward Christian Socialism. Nevertheless, he who does not go back of the present century will never understand socialism. Socialism in a very real sense is as old as human society. Laveleye in his *Primitive Property* has shown how, in the earliest times which history can trace, property, at least land, was not held by private individuals, but held and operated collectively and more or less for the common good. It is true that this was hardly a primitive communism, as Laveleye claims; for as Fustel de Coulanges and others have pointed out, altho the property was held collectively and not by individuals, it was held practically, if not nominally, by the despot or feudal head of the society, and worked by his slaves or subjects mainly for his advantage. It was primitive slavery rather than primitive communism. Nevertheless, it did contain some elements of socialism, which occasionally developed into institutions, somewhat really socialistic. From such germs came, e. g., the Russian *mir*, the Javan *desa*, the Swiss *almends*, the German *mark*, the communal families and the family communities that still linger in out-of-the-way corners of France, Italy, and Eastern Europe. We have, however, in ancient history much more direct instances of socialism. Athens may almost be said to have been,

Primitive Communism.

as far as its free citizens went, a socialistic city. It was, as far as this portion of its population went, democratically governed, and the city as a city owned and operated land, mines, forests, fields; it built temples, baths, theaters, gymnasia; it controlled and conducted commerce, art, worship, games; it supported its citizens, more than it was supported by them; the whole Greek social conception was that the individual lived for the State, rather than the State for the individual.

More socialistic was the ideal of the Hebrew theocracy. All land was held, according to this ideal, as belonging to God alone and to no individual in fee simple. Every one, however, who belonged to the theocracy—notice that he must belong to the organization to gain its advantages—was defended not in the ownership, but in the inalienable use of land and capital. He could not be permanently alienated from the land (*Leviticus* xxv.). If he was poor his property, or capital, could not be kept from him over night (*Deuteronomy* xxvi. 10-13). The law by its institutions defended the fatherless, the hiring, the stranger, the poor, the oppressed, the widow. (See JUDAISM.)

All through the ancient world were scat-

tered religious sects, like the Essenes, the Therapeutæ, who lived in communities having all property common. Through all early societies religion and communism are found hand in hand. Coming to the Christian era we have the early attempts at communism in the primitive churches, and later the monastic institutions, which were to a large extent the civilizing centers of the Middle Ages. (See CHURCH AND SOCIAL REFORM.) Feudalism (*q. v.*) was the prevailing social form; yet was its harshness tempered by the duty, more or less recognized, of the feudal lord to care for and protect his inferior. Prior to and immediately after the Reformation there were many attempts at communism; John Ball (*q. v.*), may be considered a mediæval Christian Socialist; while the Anabaptists in Germany, before they developed their sexual excesses, attempted in many ways a true communism. Such, too, were the attempts of the *Brethren of the Common Life* (*q. v.*), of the *Libertines* of Geneva, of the *Familists* of Holland, and of other similar sects whose traditions have given us in our own day the communistic colonies in America, of the Separatists, and similar sects, at Economy, Zoar, and Amana (*q. v.*). Indeed no fact in history is more marked than the persistence of the ideal and of the attempts to realize the ideal of the life in common. Plato dreamed of such a community in his *Republic*; the writings of the Christian Fathers are full of this ideal. In 1516 More published his *Utopia*; about 1600 Campanella his *City of the Sun*; in 1656 Harrington his *Oceana*. These, and many other less known writings, kept alive an ideal that has never wholly been apart from human thought.

We now come to consider the origin of modern socialism. Back of socialism lies the altruistic impulse. Socialism is essentially, and has been from the start, a humanitarian movement.

Modern Socialism.

It is not, whatever some would make it, a class movement of the Have Nots against the Haves. The major part of its foremost leaders—Owen, Saint-Simon, Gall, Marx, Lassalle, Morris, Hyndman, Vollmar, Bakounin, Krapotkine—belonged originally to the Haves. Weitling, "the father of German communism," declared that he was converted to communism by the New Testament. If German socialism has become very largely materialistic, not enough emphasis has been laid on the fact that with Marx, Lassalle, and Bakounin, their socialistic philosophy was derived primarily from Hegel, the most spiritual of all modern philosophers, unless it be Fichte, who was himself a Christian Socialist. In France, Saint-Simon, Fourier, Lamennais, and Cabet were profoundly religious. If, in England, this cannot be said of Owen, no one can doubt his intense altruistic or humanitarian impulse. The story of the personal sacrifices made by socialists for socialism never has been, and perhaps never will be, written. The Christian martyrs gave their lives expecting immediately to enter Paradise; socialists have again and again given and devoted their lives to the

cause, knowing of no Paradise, save one their children alone can enter. Altruism (originally, as we believe, sprung from the Christian faith, but, in any case, altruism) is the one great motive that has produced socialism. The occasion, however, was industrial. It is to be found in the inventions of machinery and the application of steam power, enabling successful production to be conducted only with the aid of capital, and hence putting the working-class wholly, as they were in part before, in the hands of the possessing classes, thus increasing the wealth of the latter without a similar increase in the wealth of the masses; this revolution occurring even while altruism was more and more teaching the doctrines of human equality and of the general unity of mankind.

"Socialism," says Sidney Webb, "is one of the unforeseen results of the great industrial revolution of the past 150 years. During this period man's power over the rest of nature has suddenly and largely increased; new means of accumulating wealth, and also new means of utilizing land and capital, have come into being. At the beginning of the last century, the whole value of the land and capital of England is estimated to have amounted to less than £500,000,000 sterling; now it is supposed to be over £9,000,000,000, an increase eighteenfold. Two hundred years ago, rent and interest cannot have amounted to £30,000,000 sterling annually; now they absorb over £450,000,000. Socialism arose as soon as rent and interest became important factors."

The socialist movement, thus born and thus occasioned, has been composed of three elements: the aim at personal liberty, the effort to secure this through industrial cooperation, the recognition that this cooperation to be successful must include the whole community organized as a fraternal unit. Generally speaking, the contribution of the first element came from France, of the second element from England, and of the third element from Germany. France in her Revolution, and in the philosophical writings of Rousseau, Morelly, Mably, and Brissot de Warville, aimed at personal liberty. Owen and the English Christian Socialists taught the benefit of cooperation. Hegel, Fichte, Lassalle, and Marx developed the ideal of the cooperative State.

The French Revolution was not socialistic, but necessary to socialism. The old *régime* had to be overthrown. The fatal despotism of the Louis led to Robespierre and Danton. Crimson on the throne could only create crimson in the streets. The French Revolution was necessary before socialism could be. In other countries, where the old despotisms were less absolute, the same negative process of destruction, in order to construction, was gone through, but with far less of violence. In Germany it was largely accomplished by the Stein-Hardenberg legislation. In England the political economy of Adam Smith and the gradual legislation abolishing the old grants and restrictions of trade did the same work. By 1817 France and England were ready for socialism.

For the actual beginnings of socialism, however, one must look to Robert Owen at New Lanark, and his appeal to Parliament to carry out his socialistic ideals; one must turn next to Saint-Simon and his dreams of a scientific church, whose life should be to aid the poor; one must study Fourier and the power of unity; one must read Fichte and Hegel, and learn their philosophy of the Christian State, a philosophy which, when the Church failed to accept it, produced the materialistic movement of Lassalle and of Karl Marx. We can here only mark out the periods of socialism.

Five of these great periods are distinctly marked. I. A negative or preparatory period,

beginning with the French Revolution and coming down to 1817. II. A formative or utopian period, lasting till 1848, and including the utopian schemes of Owen, Saint-

Simon, Fourier, Cabet, and others of lesser note. It culminated in the revolution of 1848. III. A period of reaction, or at least of inaction, when Europe, as far as socialism went, was lying fallow from 1849 to 1863. IV. The period of the International, from its foundation in London in 1864 to its virtual disruption in the separation of the socialists and the anarchists in the congress at The Hague in 1872. V. The present period of the social democratic movement, commencing after the breaking up of the International, but becoming active in most countries outside of Germany only in 1880-83.

In the first period men were simply striving for personal liberty, with little consciousness of how it could be reached. Characteristic of the period were the teaching of Adam Smith and the negations of the French Revolution, with the philosophy of the return to nature and of the rights of man, so brilliantly stated by Rousseau and his school, and perhaps affecting no country in the world so much as the United States of America, then just shaping its Constitution.

In the second period, Owen, Saint-Simon, Lamennais, Cabet, the great Fourierist school, even Lassalle, dreamed of ideal cooperative communities, and attempted them in France, Great Britain, and above all in numerous colonies and communities in the United States. Toward the end of the period the awakening ferment, led by Lassalle, Marx, Engels, and others, produced the communist manifesto of 1848, and perhaps more than has been realized the political and social revolutions of 1848.

But the times were not ripe. Even in France, Louis Blanc protested against the false socialism of the Ateliers Nationaux; and for a while socialism seemed dead. In the third period Europe was lying fallow.

At last, in the fourth period, in the great International Working Men's Association, founded in London in 1864, largely under the influence of Karl Marx, revolutionary socialism broke upon Europe as a flood. "Workmen of all countries, unite!" such was the cry. The night of dreams was over, the hour was come to act. Workmen of all countries tried to unite; but being in very different degrees of economic and industrial develop-

ment, the International came to stand in different countries for very different things. In England it meant little more than Trade-Unionism; and when English workmen found that on the Continent it meant more they virtually left it. In Germany it meant socialism; in most other European countries, mainly under the influence of Bakounin, it came to mean anarchism. This apostle of destruction, crazed by years of suffering in Russian prisons and Siberian exile, knew only the gospel of "pan-destruction." Falling like a firebrand into the International, he carried it in almost all the Latin countries, including southern France and parts of Belgium, into Anarchism. It wrecked the International. Marx, in the greatest deed of his life, drove out the anarchists from the congress at The Hague in 1873, and wrecking the International once for all, saved socialism from the scourge that anarchism has since proved to modern Europe. The Bakounin "Autonomist" congresses tried to continue the International, but unsuccessfully, and with the failure the period closed.

The last period is the present one. Socialism, for some years dormant after its break with the anarchists, about 1880 to 1883, gradually assumed constructive, evolutionary, political form, wholly free from anarchism, yet without any sacrifice of its aim at a complete industrial revolution. Social democracy is in this period its favorite name.

It is now both an international and a national movement. Its international character is marked first in the fact that in all European countries it has passed through the above five periods almost synchronously, and secondly, in its positive efforts at internationalism. This was marked first in the International itself, and secondly, in the modern international congresses, which are an important characteristic of the present movement. The International failed as an organized movement, because the movement in the different countries had developed such different bodies of thought that they could not coalesce; yet it succeeded in spreading through all Europe the industrial revolution. The modern international socialist congresses are succeeding because out of the revolutionary industrial thought there is being evolved a socialist program, as well as a socialist platform, which program and which platform all countries are finding that, according to their degree of industrial and political development, they must sooner or later accept. An artificial International has given place to a growing internationalism.

III. MODERN SOCIALISM.

Socialism to-day exists as a movement in various forms. Its principal manifestation, as far as the numbers of professed and avowed socialists is concerned, is in the socialist political parties of various countries which follow the ideas and program outlined principally by Marx and Engels (*q. v.*). These parties adopt strenuously and avowedly a class attitude of the workers against the capitalistic classes, tho a few wealthy and a few

more of the professional class belong to them. In Germany its adherents are known as Social Democrats, and cast in 1893 (the last general election) 1,876,738 votes. The party is strongly organized and rapidly growing in spite of all efforts on the part of the government to suppress it or to take the winds out of its sails by a program of paternal socialism. (See BISMARCK; GERMANY; INSURANCE.) In 1871 it cast only 124,655 votes, and in 1881 only 311,961. Since then its growth has been steady. It exists mainly in the larger cities and manufacturing districts, but is spreading now among the agricultural classes and in the army. It publishes some 31 dailies, 41 weeklies and semi-weeklies, several reviews and humorous papers, 45 trade journals. In France (*q. v.*) the socialists are divided into several groups, but after the first ballot, when each group has voted for its own candidate, all the groups unite in the second ballot (see FRANCE) and vote for the socialist candidate who has polled the highest vote. The differences between the groups turn mainly on questions of

Europe.

In 1896 the *Petit République* claimed that 1,400,000 socialist votes were cast at the municipal elections. The number of deputies is variously estimated at from 40 to 55, according to those who are included as socialists. In many cities the socialists are in a majority in the town councils and elect socialist mayors. In the Paris council they have a large representation. In Belgium (*q. v.*) the socialist party is very compactly and strongly organized. Since the revision of the constitution and the large extension of the suffrage, largely forced by a general strike (see BELGIUM), the socialist vote has grown very rapidly, has surpassed the Liberal vote, and is gaining rapidly on the Catholic party. The elections of 1896 for half the House of Deputies show the total socialistic vote to be 461,000, with 33 deputies. There are four large socialist dailies with a circulation of 75,000 and a large number of weeklies, etc. The cooperative socialist clubs in all the centers give the movement great organized power (see BELGIUM).

In Denmark the socialists claimed 25,019 votes in 1895 and 10 deputies. There are six socialist dailies. The Copenhagen *Social Democrat* has a circulation of 30,000.

In Holland (*q. v.*) the party is not so strongly organized; the chief radical leader, Domola Nieuwenhuis (*q. v.*), having become hopeless of success through political action, yet the Socialists report 280,000 as adhering to the Socialist political program.

In Italy (*q. v.*) the Socialist Labor Party claims 90,000 Socialist votes in 1896 and the election of 15 deputies in spite of a recent change in the election laws which they claim has disfranchised many working men.

In Austria socialists can show less organized political strength, owing to the limitations of the suffrage, but the party has a strong hold in the empire. The leading organ of the party, the *Arbeiter Zeitung* of Vienna, has a circulation of 19,000, and the party is

said to have called out 500,000 men at some of its demonstrations, and claims 70,000 members. There are some 65 socialistic journals in Austria.

In other European Continental countries the socialist party is less strongly organized, but has a nucleus of strength in Norway and Sweden, Rumania, Bulgaria, Greece, Spain, and Portugal. Even in Russia nihilism (*q. v.*) has largely developed into a socialist political movement. In Switzerland the avowed Democratic Socialist party is small, but only because socialism is advancing so rapidly in constitutional forms and changes. (See SWITZERLAND.)

In Great Britain the Social-Democratic Federation (*q. v.*) particularly stands for the German type of socialism, with its organ *Justice* and its active propaganda, but the Independent Labor Party largely stands for the same political movement, tho with a somewhat more "progressive" (gradual) program. The vote of this party in the elections of 1895 (its first general election) was 44,321. Counting all socialist candidates of all parties, the socialist vote was nearly 60,000. This, however, probably by no means indicates the real voting strength of socialism in Great Britain. In Great Britain perhaps more people than in any other country believe that the cause of socialism may be best advanced by working through one or other and perhaps (at different times) through both of the other parties. The most, tho by no means all of the English Fabian Society (*q. v.*), notoriously hold this view. Moreover in England, perhaps more than in any other country, socialism is advancing progressively in ways other than through political agitation. (See below in this article.) The same is true, and some think even more true, of the British colonies in Australasia. New Zealand (*q. v.*) is sometimes called a socialist country where all parties vie in the introduction of such socialist measures as the nationalization or municipalization of all natural monopolies (*q. v.*), of savings-banks, and of insurance; such measures as a rapidly progressing tax on incomes and land values, the development of cooperative colonies, the employment of the unemployed, etc. In Australia there is not quite so much constructive socialism, but the various labor parties are largely, and some of them explicitly, committed to socialism.

The United States thus far has developed less avowed political socialism than any other civilized country, perhaps because of its strong inherited bias toward individualism (*q. v.*). The Socialist Labor Party (*q. v.*) is the avowed representative in America of the German type of socialism, which it considers the only socialism. Its national vote in 1896 was 36,563, and it is steadily growing in most of the larger cities and industrial centers. The People's Party (*q. v.*) is by no means wholly committed to full socialism, but it does advocate many socialist measures such as the nationalization

Great
Britain and
Colonies.

United
States.

of railroads, of the money system, and of all natural monopolies, while its rank and file are very largely inclined to socialism. The *Coming Nation*, a People's Party socialist paper, has a circulation of 70,000. The total People's Party presidential vote in 1892 was 1,041,028, and on the State elections of 1894 (according to the *World Almanac* of 1896), 1,564,318. Such is a brief review of the present voting strength of socialism in the world.

But this is not the only way in which socialism is advancing. Some socialists would assert that the strongest advance of socialism is in the steady growth of monopolies, trusts, and concentrated wealth on the one hand, coupled, on the other hand, with the steady advance of democratic tendencies among the masses of all countries. Nor is the argument weakened by the fact that, among certain portions of the educated classes, there is a reaction against democracy. This reaction is largely caused by fear of a socialist democracy, and this rather shows the advance of socialism.

Other socialists find more evidence of the advance of socialism in the steady expansion of the function of the democratic State. This is admitted by those who most oppose it. Of England Herbert Spencer says:

"The numerous socialistic changes made by Act of Parliament, joined with numerous others presently to be made, will by and by be all merged in State socialism; swallowed in the vast wave which they have little by little raised." Of this advance Mr. Sidney Webb writes in the *Fabian Essays*:

"Slice after slice has gradually been cut from the profits of capital, and therefore from its selling value, by socially beneficial restrictions on its user's liberty to do as he liked with it.

Slice after slice has been cut off the incomes from rent and interest by the gradual shifting of taxation from consumers to persons enjoying incomes above the average of the kingdom.

Step by step the political power and political organizations of the country have been used for industrial ends.

"Even in the fields still abandoned to private enterprise, its operations are thus every day more closely limited, in order that the anarchic competition of private greed, which at the beginning of the century was set up as the only infallibly beneficent principle of social action, may not utterly destroy the State. All this has been done by 'practical' men, ignorant, that is to say, of any scientific sociology; believing socialism to be the most foolish of dreams, and absolutely ignoring, as they thought, all grandiloquent claims for social reconstruction. Such is the irresistible sweep of social tendencies that in their every act they worked to bring about the very socialism they despised."

This tendency has undoubtedly been carried further in England than in any other country. Yet in Germany the same work is carried out not by a democratic but by a paternal imperialism and municipalism, and the socialists believe that these governments are but constructing buildings for the steadily growing socialist democracy to occupy. In Australia and New Zealand the movement to expand State functions is largely one of conscious socialism. In the United States the tendency

is far less developed, yet more developed than many realize, and is unquestionably on the increase.

Public schools and libraries, State universities, hospitals, asylums, reformatories, the postal service, signal service, coast surveys, the highway system, labor bureaus, municipal fire departments, every court of justice, every factory act, every municipal health regulation—these and a hundred other things are socialistic.

In many American cities, too, there is a new wave of municipalism. New York City is destroying her slums and erecting baths, opening parks, and controlling tenements. Labor bureaus are establishing free employment bureaus; large portions of the population, including some by no means committed to socialism, are agitating for the municipalization of electric lighting and other natural monopolies. (For concrete evidence of the advance of socialism on these lines, see NATURAL MONOPOLIES; MONOPOLIES; ELECTRIC LIGHTING; GAS; RAILROADS; STREET-CARS; TELEGRAPH; TELEPHONE; CITIES; MUNICIPALISM; BERLIN; BIRMINGHAM; GLASGOW; LONDON; PARIS; NEW ZEALAND; AUSTRALIA; ENGLAND; SWITZERLAND.

Perhaps even more significant than the advance of unconscious socialism is the advance of conscious socialistic thought among many who do not see their way yet to vote for socialism. The writings of Carlyle, Ruskin, Morris, Ely, Bellamy, Blatchford in different countries and different circles are known universally, even by those not used to reading, and are among the most potent aids to socialistic advance. They enter the university and the farm, the church and the tenement, and everywhere they carry conviction. Many may consider them impossible dreams but wish they could be true. Such fail to see how socialism is advancing on the lines indicated above. The change in the thought of professed economists is marked, particularly in Germany and England. In other countries there may be at present a slight reaction from economic socialism, and the significance and the real socialism of the German movement of the so-called Socialists of the Chair (*q. v.*), and the confessions of English economists may have been exaggerated by some, but the very reaction shows the extent to which the change has gone. Says Sidney Webb (*Fabian Essays*):

"The publication of John Stuart Mill's *Political Economy* in 1848 marks conveniently the boundary of the old individualist economics. Every edition of Mill's book became more and more socialistic. After his death the world learned the personal history, penned by his own hand, of his development from a mere political democrat to a convinced socialist.

"The change in tone since then has been such that one competent economist, professedly anti-socialist, publishes regretfully to the world that all the younger men are now socialists, as well as many of the older professors. It is, indeed, mainly from these that the world has learned how faulty were the earlier economic generalizations, and above all, how incomplete as guides for social or political action."

Says Professor de Laveleye:

"It was at one time imagined that the means of combating socialism would be found in the teachings

Changes in Thought.

of political economy; but, on the contrary, it is precisely this science which has furnished the socialists of to-day with their most redoubtable weapons." (Introduction to *Socialism of To-day*.)

A still greater change has come over religious thought. Christian Socialism has appeared in all Christian lands and in all churches. Says Professor Kirkup, in his article on Socialism, in the *Encyclopædia Britannica*: "The ethics of socialism are closely akin to the ethics of Christianity; if not identical with them." Says Professor de Laveleye (Introduction to *Socialism of To-day*): "Every Christian who understands and earnestly accepts the teachings of his Master is at heart a socialist, and every socialist, whatever may be his hatred against all religion, bears within himself an unconscious Christianity."

The changed position of the Church of Rome, the Christian Socialist movement in Germany and in England; the growth of strong organizations, like the Christian Social Union (*q. v.*), within established churches, and of the Labor Church (*q. v.*), outside of established churches, indicate the hold which socialism has in the conscience and in the spiritual life.

Lastly, in England and now beginning elsewhere, the growth of the Fabian Society (*q. v.*), which works mainly in the more educated middle class, on all the lines noticed above, indicates at once the intellectual, practical, and political advance of socialism as branches of one movement. Professor Schæffle long ago said: "The future belongs to the purified socialism." (*Bau und Leben des Sozialen Körpers*, vol. ii. p. 120).

IV. THE ARGUMENT FOR SOCIALISM.

The supreme argument which socialists adduce in behalf of their faith is that only under socialism can mankind develop a high form of individual freedom. Under industrial competition two results, it is argued, must inevitably appear: first, the survival of those most fitted to compete in industrial warfare, which is by no means always the highest type of character, but often, to say the least, may be merely the most sharp, the most cunning, the least developed in moral sense; and as a concomitant with this, the slavery and industrial oppression of the industrially weak, who may be too moral, quite as possibly as too weak, to compete with the industrially sharp. Individualists assert that this is not the case with the present stage of individualism. For

Socialism
Freedom. proof of this they point to the increased comfort and education and situation of the producing classes. They deny that the poor are growing poorer and the rich richer. But the individualist evidence does not support the conclusion. The socialist does not say that the poor are growing poorer, but that they are growing more dependent on the employing class, which is quite another point. It is undoubtedly true that in civilized lands the producing classes are better off so far as material comfort goes than they were at the beginning of the century, tho it is not so clear

that they are better off in proportion to the wealthy class (concerning this point see WEALTH, also WAGES), but it is doubtful in the first place whether this is not due to what socialistic features exist to-day, such as trade-union combinations, public education, factory legislation, etc., and secondly, to whatever cause it be attributed, it has no bearing on the socialist contention that personal freedom is diminished under individualism.

In order to succeed to-day under competition, one or two things are all but necessary, large capital and intense devotion to money-making: usually both. The man or woman to-day possessed of large income can invest it, and with little thought or care for it live in freedom; but this is a freedom bought by the toil of others. As for the unsuccessful, they have scarcely any freedom at all. In days before machinery was so necessary to production, before capital was so organized, the small producer—the weaver, the cobbler, etc.—could be comparatively independent, tho his material comforts were few. To-day the man without capital must work for the man who has. A few quotations may illustrate this. Says Robert Blatchford (*Merrie England*, chap. xix.):

"Can anyone imagine a despotism more terrible than the regulation of work by government? I think so. I think I could find it. But I have no need to look. See; it is here, ready to my hand.

"It is here, in a letter, long kept by me, a sample of many I constantly receive:

"If you can see your way to give us poor devils of silk dyers a word or two, I am sure it would do us good. We work longer hours than any others in the trade in England, get less wages, and, for our lives, or rather our situations, dare not openly belong to a union. If we strike—as we did last summer—pressure is brought upon us by our wives and children (nearly all of whom have to work) being dismissed from their situations. If we write to the *Leeds Times*—the best friend we poor dyers ever had—we are afraid to sign our names; and if we have a meeting it has to be kept a dead secret. In fact, it is not worth living to work under such circumstances, and as far as I can see the only union we shall ever get will be the union workhouse, and many of us are half-way there now. Give us a word to strengthen the fearful and encourage the weak. Somebody must help us. We cannot help ourselves. We have been down so long that we don't know how to get up.

"P. S. For God's sake do not mention my name."

The quoted letter could be duplicated, so far as its revelation of slavery goes, in any city or industrial center of the United States or Great Britain. Says an American writer, Mr. Ira Steward (*q. v.*), quoted in the fourth report of the Massachusetts Bureau of the Statistics of Labor:

"Poverty makes the poor poorer and independence impossible. It corrupts judges, ministers, legislators, and statesmen. It decides marriages, shortens human life, hinders education, and embarrasses progress in every direction. It gives rise, directly and indirectly, to more anxiety, suffering, and crime than all other causes combined. Poverty crams cities, and their tenement-houses, with people whose conduct and votes endanger the republic. The dangerous classes are always poor. There is a closer relation between poverty and slavery than the average abolitionist ever recognized. . . . The anti-slavery idea was that every man had the right to go and come at his will. The labor movement asks how much this abstract right is worth, without the power to exercise it. . . . The laborer instinctively feels that something of slavery still remains, or that something of freedom is yet to come, and he is not much interested in the anti-slavery theory of liberty."

On questions of personal liberty, Mill may be allowed some weight, and Mill emphatically declared that "the restraints of communism would be freedom in comparison with the present condition of the majority of the human race."

The objection to this, that socialism itself would be slavery to the will of the majority, we consider later under objections to socialism. We notice now that socialists assert that not only is there industrial slavery, to-day, but that there always must be under industrial competition, at least for the masses. Men are not equal in ability—given that fact, which no man can deny, and it must inevitably follow that if men compete for the means of existence, the weak must be servants of the strong, and the strong must survive only on condition of perpetual strife. The employer to-day under competition cannot pay what wages he would. He must pay the market rate or be undersold by those who will pay lower wages. Even the rich hold their riches at the price of a competition which may spring up any moment that they do not shrewdly manage their investments or have some one to manage them for them. Competition rules not only the slave, but the taskmaster. Nor is this all. The few rich will not compete. They find it better to combine. Hence, the weak become slaves not only of wealth, but of combined wealth. Says Mr. Bellamy (address at Boston, May 31, 1889):

"A brief consideration of the causes which have led to the present world-wide movement for the substitution of combination in business for competition will surely convince any one that, of all revolutions, this is the least likely to go backward. It is a result of the increase in the efficiency of capital in great masses, consequent upon the inventions of the last and present generations. In former epochs the size and scope of business enterprises were subject to natural restrictions. There were limits to the amount of capital that could be used to advantage by one management. To-day there are no limits, save the earth's confines, to the scope of any business undertaking; and not only no limit to the amount of capital that can be used by one concern, but an increase in the efficiency and security of the business proportionate to the amount of capital in it. The economies in management resulting from consolidation, as well as the control over the market resulting from the monopoly of a staple, are also solid business reasons for the advent of the trust."

The problem to-day is not one of combination *vs.* competition; but simply of what kind of combination we shall have; the combination of the many or of the few.

Nor can freedom be preserved by doing away with government or by taxing land values with the hope of giving equal opportunity to all. These theories of extreme individualism (Single Tax, Philosophical Anarchism, etc.) all rest on the assumption that all men need is equal material opportunity; they theorize of a competition among equals; but the result would be a competition among unequals, and the strong would be able to seize and occupy, or pay for the best land, amass capital, etc., and lord it over the weak as to-day. Nor would the reward be even proportional to ability; because immoral and feeble descendants of the wealthy inheriting large capitals, as they often do to-day, could under free land live in luxury on the slavery of others.

The second great argument for socialism is that it would produce not only greater personal freedom, but a higher type of character. Character tends to be what men strive for. If men have to concentrate their attention on industrial competition, they tend to develop materialism and shrewdness. This is exactly what we have to-day. Artists complain that commercialism is killing art; religionists say we are growing material; the bourgeois middle-class boast of our material inventions. It is the natural result of industrial competition. Under socialism, if men seek the good of all it will produce a higher character.

**Socialism
and
Character.**

Once with naked hand or rudest club men fought for existence; later, with poisoned arrow and with hurtling spear they battled for the best fisheries and the richest hunting-grounds. A physical competition produced physical individuality, the physical giant, the Goliaths, the Achilles, the Agamemmons, kings of men. Then came a competition a little more intellectual, producing an Alexander, a Richard Cœur de Lion. Next came the modern world where men battle, not with poisoned spears, but with poisoned groceries; not with clubs but, like bulls and bears, with cornerings of the market and tricks of trade. It produces the Jay Gould and the Baron Rothschild. Now comes socialism, and says, Let us cooperate in industry, and compete only to see who shall best serve the public. Is it not easy to see what kind of an individuality it will produce?

Mr. Blatchford, in *Merrie England*, says of Mr. Morley's argument that if existence were no longer a sordid struggle for money the genius of the people would die out, and we should sink into barbarism, and retain nothing but the bare necessities of life,

"What do his words assume? They assume:
"1. That the greatest and noblest of the race are actuated by avarice. Which is not true.
"2. That the greatest and noblest of the race secure the most *wealth*. Which is not true.
"What think you is the chief food of genius? Does the prospect of wealth inspire Hamlets or Laocoons, and steam-engines and printing-presses? The true artist, the man to whom all creative work is due, is mainly inspired, sustained, and rewarded by a love of his art. Milton wrote *Paradise Lost* for £3. Can greed produce a poem like it? The Gradgrind supposes greed to be the ruling passion because in the society he knows most men strive to get money. But *why* do they strive to get money? There are two chief motives. One the desire to provide for or confer happiness upon children, on friends; the other the desire to purchase applause. But in the first place the motive is not greed, but love; and in the second case it is not greed, but vanity. Only a *miser* covets money for its own sake. Both love and vanity are stronger passions than greed."

Other arguments for socialism are of less importance, but socialists argue that, altho the producing classes may be somewhat better off than they were, there is still a terrible amount of want and destitution which socialism would relieve. Says Mr. Frederic Harrison:

"To me, at least, it would be enough to condemn modern society as hardly an advance on slavery or serfdom, if the permanent condition of industry were to be that which we behold, that 90 per cent. of the actual producers of wealth have no home that they

can call their own beyond the end of the week ; have no bit of soil, or so much as a room that belongs to them ; have nothing of value of any kind except as much old furniture as will go in a cart ; have the precarious chance of weekly wages which barely suffice to keep them in health ; are housed for the most part in places that no man thinks fit for his horse ; are separated by so narrow a margin from destitution that a month of bad trade, sickness, or unexpected loss brings them face to face with hunger and pauperism. . . . This is the normal state of the average workman in town or country."

Yet there is wealth enough for all, were it wisely managed. (See WEALTH.)

In the United States the per capita wealth of the country, according to the census of 1890, is \$867 per family.

But under socialism production would be increased. There are millions to-day of the wealthy, the unemployed poor, soldiers, etc., who are supported

Socialism out of the total product, but who
Economical. do little or no productive work.

Were they set to work, the income would be greatly raised. Still more would many sources of expense be saved. The monopolies we have to-day cheapen or multiply production (see MONOPOLY). A general system of monopoly could enormously increase production. Savings of almost untold amount could be made in doing away with uselessly multiplied machinery, salaries, advertising. Says Mr. Blatchford :

"Commercial waste is something appalling. The cause of commercial waste is competition. The chief channels of commercial waste are account-keeping, bartering, and advertising. If we produced goods simply for use instead of for sale, we should save all this waste. But consider the immense number of cashiers, bookkeepers, clerks, salesmen, shopmen, accountants, commercial travelers, agents, and advertisement canvassers employed in our British trade.

"Take the one item of advertisement alone. There are draughtsmen, paper-makers, printers, bill-posters, painters, carpenters, gliders, mechanics, and a perfect army of other people all employed in making advertisement bills, pictures, hoardings, and other abominations—for what ?

"To enable one soap or patent-medicine dealer to secure more orders than his rival. I believe I am well within the mark when I say that some firms spend £100,000 a year in advertisements."

The indirect results of the removal of poverty are all but incalculable: the abolition of prostitution and (since, as we have seen, character would be elevated) the lessening of lust ; the decreasing of intemperance, largely to-day the result of poverty (*q. v.*) ; lessening of money quarrels, especially of family money quarrels ; the giving of healthy environment and education to all children ; the making it possible for all men and all women to earn an honorable living by a little regular honorable work ; and the grading of society, not by money but by usefulness to the community, thus largely doing away, for one thing, with temptations to marriage for money. Such are some of the momentous indirect advantages claimed for socialism.

OBJECTIONS TO SOCIALISM.

These will be found in full under article Individualism. Probably the most widely spread objection to socialism is that it is an impossible and impracticable Utopia. The answer to this

is that it is actually and rapidly coming ; and that even extreme individualists admit this.

Mr. Sidney Webb, in his *Socialism in England*, describes the individualistic city councilor, who will spend a day among socialistic institutions, and not knowing that these are socialism, will say, "Socialism, sir ! Don't talk to a practical man about your fantastic absurdities."

Mr. Kidd says (*Social Evolution*, chap. viii. :

"We have not now to deal with mere abstract and transcendental theories, but with a clearly defined movement in practical politics, appealing to some of the deepest instincts of a large proportion of the voting population, and professing to provide a program likely in the future to stand more and more on its own merits in opposition to all other programs whatever."

It is true that Mr. Kidd does not admit that complete socialism is coming. He argues that we shall have State control of monopolies, but a control only to prevent monopoly, not the formation of State monopolies. So argue many economists. But to this it must be replied, in the first place, that Mr. Kidd argues this, simply on account of the supposed necessity of individual competition to progress, which biological argument we consider later, and secondly, all facts to-day point to the steady growth, not only of State control, but of State ownership. The blue books of the world can be ransacked, and scarcely an instance can be found of an activity once assumed by the State reverting to private hands, while the evidences of expanding activity of ownership as well as of control are on every hand.

A second objection is akin to the first. It is that socialism would never work because men are too selfish and ignorant to carry on the vast cooperative State that it would require.

This is to many the supreme objection against socialism. Knowing the ability it takes to organize and carry on even an ordinary business, their experience with trade-unions and other organizations of the so-called working classes has not convinced them that the masses are able to conduct the enormous interests that socialism would place in their hands ; while their knowledge of government, under the corrupting power of appointments, does not incline them to turn over to government all the offices that would have to be filled under a system of nationalized railroads, to speak of nothing more.

But let us look at facts. Has not cooperation succeeded, as a matter of fact, almost marvelously ? Have not English, American, German, and French working men proved themselves capable of cooperation, even on a very large scale ?

The cooperative societies of England, with their millions of pounds of capital, their million and more of members, their wholesale and retail stores ; the thousands of cooperative banks and other forms of cooperation in Germany and France ; the cooperative transactions of the United States, estimated by Professor Ely at millions of dollars annually, show what can be done.

Nor against the great success of cooperation

Socialism
Utopian ?

must one count too heavily the admitted failures. Cooperative experiments to-day have to battle against the competition of enormous combinations of wealthy private firms, able to carry on business for a year at a loss, in order to run out the cooperative ventures. Under the circumstances, the wonder is not that co-operation sometimes fails, but that it ever succeeds. Its success only shows what the masses can do against great odds; odds, indeed, so great that many believe the future cannot be fought out on private lines. In a cooperative commonwealth where the community carried on all industry, it would have no such organized foe to meet. And it must not be supposed that industry would be taken over by the States *en bloc*. Socialists are evolutionists. Industry is to-day being concentrated. Its practical details are not managed by owners, but by salaried overseers and managers.

**Socialism
Impracticable?**

In being socialized an industry could still be managed in exactly the same way, and perhaps usually by the same men, only by these men working for the public, not for a few stockholders. There would be no upheaval, and small change.

As to the corruption of government, we are not to think, in the first place, of a vast centralized machine. We are to remember that socialism is essentially democratic, with great emphasis on *local self-government*. There would be less of the central appointing power than there is to-day. The safety of the town-meeting system in the United States is that every man knows personally the man he votes for, and so the right men are elected; which principle would be carried out under socialism, only still further. But what are the causes of the corruption of government, as in the United States? First, the fact that for generations Americans have despised government, and let it play a small and a low part in their life. This has had its natural result. Smart, pushing men have been able to make more money elsewhere; therefore they have not taken office; good men have, as a rule, left politics alone. Is it any wonder that such politics have become corrupt? Men have left government to the saloon-keeper, and now blame government because they have pot-house politics. This is the first reason. The second reason is that business having been amassed in a few hands, and these few having found that special legislation can be had by directly or indirectly bribing the low politicians we have put in power, the average corporation has become politically a corrupting power. We do not need to prove these points. They are admitted by every thinker. It is to this corruptive power of amassed wealth, playing upon the venality and sometimes the necessities of those who have made politics a profession, that is due the scandalous corruption of government. Socialism would remove both causes. As long as there are masses of poor people on the one side, and a few corporations enormously wealthy on the other, there will be corruption, and no amount of indignant "citizens' movements" can perma-

nently prevent it. As long as corporations pay managers and attorneys several times the salaries that the State pays, the smartest men will be in the service of the corporations, inside or outside of government. The way to pure government is not first to purify the State and then increase its activities. This is chimerical. But first to increase its activities, to make it important, to enable it to pay large salaries and to carry out large ideas, and then it will become pure; men will be attracted to it who cannot be bought. Just so long as we despise the State will it be despicable; when we begin to magnify it and exalt it over the corporations, will it begin to be pure and magnificent. We base this statement not upon theory but upon facts.

Birmingham was once the most corrupt municipality in England. Squalor and overcrowding were universal. The death rate was enormous. Vice and crime flourished. Saloon-keepers were the only contented people. A tavern coterie ruled the city. But in 1871 Mr. Chamberlain came forward with a program of municipal activity. He was elected, a loan of £1,600,000 was obtained, and to-day Birmingham is perhaps what it was recently called by Julian Ralph in *Harper's Magazine*, "the best governed city in the world," "a business city, run by business men on business principles."

In other cities of England and Scotland, in Germany and France, cities are pure just about in proportion that their functions are magnified. (For further proof of this, see MUNICIPALISM.)

It is, of course, not claimed that socialism would be absolutely pure. It is only claimed that there would be far less corruption than to-day. Even now, though politics are corrupt, they are often far less corrupt than private corporations. If the United States post-office department is not pure, it is at least vastly more pure than most private monopolies.

A third objection to socialism is the asserted cost and inefficiency of all work undertaken by governments. The answer to this is the denial of the fact as applied to modern democratic governments that undertake socialist measures. Ancient corrupt monarchies, or modern democracies that are made the cat's-paw of great corporations, may be rotten with jobs, and governments do not immediately grow pure in a day, but an ever increasing amount of evidence is accumulating to show that government work conducted on socialist lines is both cheap and good. (See CONTRACT LABOR; MUNICIPALISM; ELECTRIC LIGHTING; GAS; RAILROADS; STREET-CARS; TELEGRAPHS; TELEPHONES; BERLIN; BIRMINGHAM; GLASGOW; LONDON; PARIS.) It must be remembered that in two directions government activities decline to compete with private activities. Governments, in the first place, decline to pay the low wages for long hours that many corporations pay.

Secondly, private corporations do only what pays; governments do what does not pay. A

private mail might carry letters in large quantities between large cities more cheaply than the government, but the government carries letters to small villages where it does not pay as cheaply as to large cities where it does. A comparison between the cost and accommodations in small villages of the telegraph in the United States under private management and those of the post-office under public ownership is a case in point. The public ownership of monopolies is everywhere winning its way in the world on its merits, cheapness, and efficiency, even among many who care nothing for socialism. Governments undoubtedly still do stupid and foolish things for individualists to pick flaws with, but Mr. Spencer's classic catalogue of the sins of legislators are mainly out of date and easily overmatched by the frauds of private companies.

A somewhat more plausible objection is that socialism would mean the subjection of the individual to the will of the majority, who would be the mediocre. But to this it must be answered, first, that socialism is not State socialism (see above), except where the State is democratic, a cooperative commonwealth, so that the submission of the individual is only that of a cooperator to the decision of a majority of a body of cooperators in which he has a voice. Secondly, it must be remembered that freedom (*q. v.*) can never be more than relative. Absolute freedom is a myth. The only question is under what form of society the individual would be most free. How much freedom the average individual has under individualism we have seen above in Mill's declaration that "the restraints of communism would be freedom in comparison with the present condition of the majority of the human race." Socialists do not deny the fact that under socialism there would be some necessary and some unnecessary subjection of the individual to the will of the many, and that this power would not always be wisely used. They assert, however, that there would not be so much compulsion as many think, and still more assert that there would be far less compulsion of the individual than there is today. They believe that the community has the right to rule the individual for the good of all; they also believe that it is for the good of all that there be no more compulsion than necessary. They, however, base their views not on any theory of natural rights, but on frank reasoning from experience and expediency. Says Mr. Blatchford (*Merrie England*, chap. xix.):

"You will ask me how a socialist State would apportion the work. I ask you how the work is apportioned *now*.

"You have a son, say a lad of 14, and wish to put him to a trade. You ask him his choice. He says he would like to be a cabinet-maker. You apply at the shops in your own town and you find that trade is bad, or that the allowed number of apprentices is made up. So you get the boy work as an engineer or a painter.

"That is to say, your boy can choose his trade *subject to the demand for labor of certain kinds*. If all boys wanted to be engineers, they could not all get work at that trade.

"These conditions would exist under socialism.

The State or the municipality would need a certain number of plumbers and a certain number of painters. If more boys asked to be painters than the State needed to do its painting, some of those boys would have to take other work. Where does the slavery come in?"

And it must be remembered that under socialism, where all worked cooperatively with abundant capital, the material work of the world could be done by each working a very few hours per day. All the rest of the day they would be free.

Simply to live, painters paint pot-boilers, dramatists write dramas to fill the house, undertakers smirk and bow and scrape, reporters report "to suit," clergymen preach sermons that will "draw." Socialism, in a word, would mean independence compared with the present.

Professor Huxley has well ridiculed Mr. Spencer's conception of society, where every man is for himself, and no man has to do with his neighbors, except to prevent their interference with himself. He says:

"Suppose that, in accordance with his view, each muscle were to maintain that the nervous system had no right to interfere with its contraction, except to prevent it from hindering the contraction of another muscle; or each gland that it had a right to secrete, so long as its secretion interfered with no other; suppose every separate cell left free to follow its own 'interests,' and *laissez faire*, Lord of all, what would become of the body physiological?" (*Administrative Nihilism*.)

The objection to socialism most raised by scientific men is that, by checking competition, it would inevitably produce deterioration of the race. (See INDIVIDUALISM.)

The answer is the denial, in the first place, that socialism would prevent all competition. Every man would have to work. "He that will not work, neither shall he eat," is written over every socialist portal. Those who worked the most effectively for the community would infallibly secure the greatest honor. Socialism would thus not do away with all competition. Civilization has largely done away with physical competition; do any advocate returning to it? Socialists would simply do away with industrial competition and replace it by a competition for honor. Says Mrs. Besant (in the *Fabian Essays*):

"The desire to excel, the joy in creative work, the longing to improve, the eagerness to win social approval, the instinct of benevolence—all these will start into full life, and will serve at once as the stimulus to labor and the reward of excellence. It is instructive to notice that these very forces may already be seen at work in every case in which subsistence is secured, and they alone supply the stimulus to action. The soldier's subsistence is certain, and does not depend on his exertions. At once he becomes susceptible to appeals to his patriotism, to his *esprit de corps*, to the honor of his flag; he will dare anything for glory, and value a bit of bronze, which is the 'reward of valor,' far more than a hundred times its weight in gold. Yet many of the private soldiers come from the worst of the population; and military glory and success in murder are but poor objects to aim at. If so much can be done under circumstances so unpromising, what may we not hope from nobler aspirations? Or take the eagerness, self-denial, and strenuous effort thrown by young men into their mere games! The desire to be captain of the Oxford eleven, stroke of the Cambridge boat, victor in the foot-race or the leaping—in a word, the desire to excel—is strong enough to impel to exertions which often ruin physical health. Everywhere we see the multifarious desires of humanity assert themselves

Emulation.

when once livelihood is secure. It is on the devotion of these to the service of society, as the development of the social instincts teaches men to identify their interests with those of the community, that socialism must ultimately rely for progress; but in saying this we are only saying that socialism relies for progress on human nature as a whole, instead of on that mere fragment of it known as the desire for gain."

Nor do socialists admit that science to-day declares the struggle for existence the *only* means of progress. Such was the dictum of the science of yesterday, but not of to-day. Says Professor Giddings (*The Principles of Sociology*):

"From the moment that conscious association began it was a continuous agency among the factors of evolution."

He quotes M. Krapotkine as saying:

"Life in societies is the most powerful weapon in the struggle for life, taken in its widest sense. . . . Life in societies enables the feeblest insects, the feeblest birds, and the feeblest mammals to resist, or to protect themselves from the most terrible birds and beasts of prey; it permits longevity; it enables the species to rear its progeny with the least waste of energy, and to maintain its numbers. Albeit a very slow birth rate."

Few socialists deny the truth of Malthusianism, as held to-day, that, *in any given state of industry and the arts*, population tends to increase faster than it is possible to raise the general plane of living, but they argue that this would be solved in part by the necessity to raise the state of industry and art, and still more by due checks upon population. Says John Stuart Mill (*Political Economy*, bk. ii. chap. i.):

"Another of the objections to communism is similar to that so often urged against poor-laws: that if every member of the community were assured of subsistence for himself and any number of children, on the sole condition of willingness to work, prudential restraint on the multiplication of mankind would be at an end, and population would start forward at a rate which would reduce the community through successive stages of increasing discomfort to actual starvation. There would certainly be much ground for this apprehension if communism provided no motives to restraint equivalent to those which it would take away. But communism is precisely the state of things in which opinion might be expected to declare itself with greatest intensity against this kind of selfish intemperance. Any augmentation of numbers which diminished the comfort or increased the toil of the mass would then cause (which now it does not) immediate and unmistakable inconvenience to every individual in the association; inconvenience which could not then be imputed to the avarice of employers or the unjust privileges of the rich. In such altered circumstances opinion could not fail to reprobate, and if reprobation did not suffice, to repress by penalties of some description, this or any other culpable self-indulgence at the expense of the community. The communistic scheme, instead of being peculiarly open to the objection drawn from danger of over-population, has the recommendation of tending in an especial degree to the prevention of that evil."

The last objection we consider is that the socialist movement forgets or ignores personal character. This is the charge continually, tho largely indirectly, made in *Aspects of the Social Problem*, edited by Bernard Bosanquet (1895). Mr. Sidney Ball, reviewing the book in the *International Journal of Ethics* (April, 1896), under the caption, *The Moral Aspects of Socialism*, well answers the charge and says:

"At first sight it seems true that character has not been put in the foreground of socialist discussion; its emphasis appears to be laid almost exclusively on

machinery, on a reconstruction of the material conditions and organization of life. But machinery is a means to an end, as much to a socialist as to any one else; and the end, at any rate as conceived by the socialist, is the development of human nature in scope, powers of life and enjoyment. . . . The forces required to work collectivist machinery are nothing if not moral; and so we also hear the complaint that socialists are too ideal, that they make too great a demand upon human nature and upon the social will and imagination. Of the two complaints this is certainly the most pertinent. A conception, however, which is liable to be dismissed, now as mere mechanism, now as mere morality, may possibly be working toward a higher synthesis. . . . If institutions depend on character, character depends on institutions; it is upon their necessary interaction that the Socialist insists."

(For contrary views, see INDIVIDUALISM; ANARCHISM; SINGLE TAX, etc.)

SOCIALIST LABOR PARTY, THE (of the United States).—The great socialist movement of France, Germany, Belgium, and other European countries naturally exerts a marked influence upon the movement in America. Socialism is as international as the capitalist system of production. It found an early expression in the International (*q. v.*) which from 1867 to 1869 attained considerable strength in the United States.

As the capitalist system of production had not reached its culmination of development, so the socialist movement waited upon the gigantic strides of modern productive forces. So indistinct were the ideas of some of its early adherents that socialist and anarchist were classed together, altho holding opposite views of the functions of government. (See ANARCHISM.)

In the November election of 1877, however, a Social Democratic Workingmen's Party organized in July, 1876, cast 1365 votes in the city of New York. Immediately after this election, the name Socialist Labor Party was adopted, but its political action was intermittent. In the campaign of 1886 the socialists, working with other professed labor forces, supported Henry George for Mayor of New York. They did not, however, adopt the Single-Tax theory, and soon after this election the breach between socialists and Single Taxers became permanent. Anarchists were also eliminated, and the party, thenceforth refusing all alliances, acted only under its present distinctive name and principles, which, as presented in its platform, are in unity with the whole international political socialist movement.

The growth of the party is best shown by its vote cast in the United States from the year 1888 :

Total vote, 1888 (Presidential)..... 2,068
Total vote, 1892 (Presidential)..... 21,157
Total vote, 1896 (Presidential)..... 36,503

During this time the party has clearly defined the difference between mere labor politics and socialist politics, between the Old Trades' Unionism, whose motto is "no politics in unions," and the New Trades' Unionism, which is avowedly in sympathy with the Socialist Labor Party.

The Socialist Labor Party insists that the old methods must give place to active work in the political field, if organized labor is to gain any permanent improvement in its condition. To this end the Socialist Trade and Labor Alliance has been organized as a national body, composed of delegates from unions whose active support is given to the Socialist Labor Party.

The Socialist Labor Party recognizes two existing classes in every country—the exploiters and the exploited. They hold that no party controlled by either great or small capitalists can or will abolish this condition, and that only a party wholly in the interest of the exploited class will aid in overthrowing the capitalist system and substituting the cooperative commonwealth.

Its main German organs are the *Vorwärts* (weekly) and *New Yorker Volkzeitung* (daily), and its main English organ *The People*, all published at 184 William Street, New York. H. B. SALISBURY.

The platform, adopted in New York, July 9, 1896, is as follows :

"The Socialist Labor Party of the United States, in convention assembled, reasserts the inalienable right of all men to life, liberty, and the pursuit of happiness.

"With the founders of the American Republic, we hold that the purpose of government is to secure every citizen in the enjoyment of this right; but in the light of our social conditions, we hold, furthermore, that no such right can be exercised under a system of economic inequality, essentially destructive of life, of liberty, and of happiness.

"With the founders of this Republic we hold that the true theory of politics is that the machinery of government must be owned and controlled by the whole people; but in the light of our industrial development we hold, furthermore, that the true theory of economics is that the machinery of production must likewise belong to the people in common.

"To the obvious fact that our despotic system of economics is the direct opposite of our democratic system of politics can plainly be traced the existence of a privileged class, the corruption of government by that class, the alienation of public property, public franchises, and public functions to that class, and the abject dependence of the mightiest of nations upon that class.

"Again, through the perversion of democracy to the ends of plutocracy, labor is robbed of the wealth which it alone produces, is denied the means of self-employment, and, by compulsory idleness in wage slavery, is even deprived of the necessities of life.

"Human power and natural forces are thus wasted, that the plutocracy may rule.

"Ignorance and misery, with all their concomitant evils, are perpetuated, that the people may be kept in bondage.

"Science and invention are diverted from their humane purpose to the enslavement of women and children.

"Against such a system the Socialist Labor Party once more enters its protest. Once more it reiterates its fundamental declaration that private property in

the natural sources of production and in the instruments of labor is the obvious cause of all economic servitude and political dependence.

"The time is fast coming when, in the natural course of social evolution, this system, through the destructive action of its failures and crises on the one hand, and the constructive tendencies of its trusts and other capitalist combinations on the other hand, shall have worked out its own downfall.

"We, therefore, call upon the wage-workers of the United States, and upon all other honest citizens, to organize under the banner of the Socialist Labor Party into a class-conscious body, aware of its rights and determined to conquer them by taking possession of the public powers; so that, held together by an indomitable spirit of solidarity under the most trying conditions of the present class struggle, we may put a summary end to that barbarous struggle by the abolition of classes, the restoration of the land and of all the means of production, transportation, and distribution to the people as a collective body, and the substitution of the Cooperative Commonwealth for the present state of planless production, industrial war, and social disorder; a commonwealth in which every worker shall have the free exercise and full benefit of his faculties, multiplied by all the modern factors of civilization.

"With a view to immediate improvement in the condition of labor we present the following demands:

"1. Reduction of the hours of labor in proportion to the progress of production.

"2. The United States to obtain possession of the mines, railroads, canals, telegraphs, telephones, and all other means of public transportation and communication; the employees to operate the same cooperatively under control of the Federal Government, and to elect their own superior officers; but no employee shall be discharged for political reasons.

"3. The municipalities to obtain possession of the local railroads, ferries, waterworks, gasworks, electric plants, and all industries requiring municipal franchises; the employees to operate the same cooperatively under control of the municipal administration, and to elect their own superior officers; but no employee shall be discharged for political reasons.

"4. The public lands to be declared inalienable. Revocation of all land grants to corporations or individuals, the conditions of which have not been complied with.

"5. The United States to have the exclusive right to issue money.

"6. Congressional legislation providing for the scientific management of forests and waterways, and prohibiting the waste of the natural resources of the country.

"7. Inventions to be free to all; the inventors to be remunerated by the nation.

"8. Progressive income tax and tax on inheritances; the smaller incomes to be exempt.

"9. School education of all children under 14 years of age to be compulsory, gratuitous, and accessible to all by public assistance in meals, clothing, books, etc., where necessary.

"10. Repeal of all pauper, tramp, conspiracy, and sumptuary laws. Unabridged right of combination.

"11. Prohibition of the employment of children of school age and the employment of female labor in occupations detrimental to health or morality. Abolition of the convict labor contract system.

"12. Employment of the unemployed by the public authorities (county, city, State, and Nation).

"13. All wages to be paid in lawful money of the United States. Equalization of women's wages with those of men where equal service is performed.

"14. Laws for the protection of life and limb in all occupations, and an efficient employers' liability law.

"15. The people to have the right to propose laws and to vote upon all measures of importance, according to the referendum principle.

"16. Abolition of the veto power of the Executive (national, State, and municipal), wherever it exists.

"17. Abolition of the United States Senate and all upper legislative assemblies.

"18. Municipal self-government.

"19. Direct vote and secret ballots in all elections. Universal and equal right of suffrage without regard to color, creed, or sex. Election days to be legal holidays. The principle of proportional representation to be introduced.

"20. All public officers to be subject to recall by their respective constituencies.

Demands.

"21. Uniform civil and criminal law throughout the United States. Administration of justice to be free of charge. Abolition of capital punishment."

SOCIALISTS OF THE CHAIR.—In 1871, in Germany, Herr Offenheim, in the *National Zeitung*, dubbed those professors of political economy who incline toward certain socialistic views, *Kathedersozialisten* (Academic Socialists or Socialists of the Chair). The term was taken up and accepted by Professor Schmoller (*q. v.*) in his opening address at a gathering at Eisenach in 1872, of those who sympathize with the view, and it led to somewhat of a movement in Germany, and the formation in 1873 of the *Verein für Sozial-Politik* (Social Economic Club), an organization to represent their views, holding meetings almost annually and producing considerable literature. The name has passed into other countries, and in England and America is applied to professors (and they are not a few, see **SOCIALISM**) who incline to certain socialistic propositions. Nevertheless Socialists of the Chair are not socialists. In Germany, especially, they stand for little more than an expansion of the paternal State, while socialists oppose paternalism.

Professor Schmoller, in his opening address at Eisenach, said:

"The marked division of classes in the midst of existing society, the open war between masters and workmen, between owners and proletarians, and the danger, still distant but threatening the future, of a social revolution, have for some years caused doubts to arise as to the truth and definitive triumph of the economic doctrines represented by the congress of economists; and on all sides it is questioned whether absolute freedom of labor and the complete abolition of the antiquated regulations of the Middle Ages will bring about that perfectly happy situation which the believers in *laissez faire* have so enthusiastically predicted." While thus separating himself from the old optimism of the Manchester party (*Das Manchesterthum*), Schmoller was careful to show that he did not accept the conclusion of the socialists. "Tho by no means satisfied," he said, "with existing social conditions, and convinced of the necessity of reforms, we preach neither the upsetting of science nor the overthrow of the existing social order, and we protest against all socialistic experiments. All the great advances shown in history have been the result of the work of ages. The existing economic legislation, the present methods of production, the psychological conditions of the different classes ought to be the basis of our reforming energy. We demand neither the abolition of industrial freedom nor the suppression of the wage system; but we do not wish, out of respect for abstract principles, to allow the most crying abuses to become daily worse, and to permit so-called freedom of contract to end in the actual exploitation of the laborer. We do not desire the State to advance money to working men in order that they may make experiments on systems inevitably destined to fail; but we demand that it should concern itself, in an altogether new spirit, with their instruction and training, and should see that labor is not conducted under conditions which must have for their inevitable effect the degeneration of the laborer."

"On the whole," says the Report on Germany of the (English) Royal Commission on Labor, "the Academic Socialists represent the moderate party, whether in politics or in social science, the party which, while recognizing the value of State intervention, recognizes also that 'self-help' is a condition of economic progress, and to these two principles adds a third, that of the aid of society (*Gesellschaftshilfe*) or 'the free exercise of the beneficent and educating influence which belongs to the cultivated classes.'"

SOCIAL PURITY MOVEMENT IN EUROPE (THE).—(For the movement in America, see **AMERICAN PURITY ALLIANCE**.) The British, Continental, and General Federation for the Abolition of State Regulation of Vice is the representative purity organization of Great Britain and Continental Europe. It was organized at an international congress held in Geneva, Switzerland, in 1877. Its honorary president and pioneer founder is Mrs. Josephine E. Butler of England. Its president in 1897 is the Rev. M. Henri Pierson of Holland; its honorary secretary and treasurer is Professor James Stuart, M. P., of London; its secretary at its international headquarters in Geneva, Switzerland, is M. Henri Minod. Its official organ, published at Geneva, is *The Bulletin Continental*. Its object is to secure the abolition of State regulated, legalized vice, and to promote a high, equal standard of morals for both men and women. It has auxiliary associations, or committees, in Great Britain, France, Switzerland, Italy, Belgium, Holland, Germany, Sweden, Norway, Denmark, and most countries of Continental Europe. In Great Britain there have been organized the following associations, some of them antedating the International Federation, most of which are still in existence: The National Association, The Ladies' National Association, The London Ladies' Association, The City of London Committee, The Friends' Association, The Congregational Committee, The Free Church of Scotland Committee, The Northern Counties League, The Midland Counties Electoral Union, The Workmen's League, The Moral Reform Union, The National Vigilance Association, The Gospel Purity Association. The Social Purity Alliance and the White Cross organizations, having their headquarters in London, are also a part of the general purity movement. Alike in Great Britain and on the Continent the movement has the strong and influential support of gifted and able men and women prominent in philanthropic and religious work, and in the legal and medical professions. Since the organization of the International Federation, State regulation of vice has been abolished in the military districts of Great Britain, in every canton except Geneva in Switzerland, and in various municipalities of Holland, Belgium, Norway, and Sweden. It has given rise to much helpful rescue work, and by conferences, meetings, and the dissemination of appropriate literature is effectively preparing public opinion for the ultimate abolition of the unjust, immoral system of legalized vice in all Continental countries.

ANNA RICE POWELL.

SOCIOLOGY (from Latin *socius*, a comrade, whence *societas*, society, and Greek *λόγος*, reason) is in general the science of society. Three distinct conceptions of the science have, however, prevailed. It has been conceived (1) as a mere coordination of the various particular social sciences; (2) as itself a particular science dealing with all social relations not considered under other social sciences; (3) as a science of the fundamental laws

and general principles underlying all social phenomena. This is the view which obtains to-day with the best thinkers. It is a modern science. Plato, Aristotle, Aquinas, Hobbes, Locke, Montesquieu, Rousseau, Hume, Bentham, Burke, Hegel, Fourier, and others developed many profound and valuable thoughts as to social principles, yet Comte (*q. v.*) in 1838 first used the word sociology for the science of society, or social physics, as he called it, and first developed social principles in a systematic way, based, as he believed, on an induction from facts. He conceived of the social world as a unity, looked at according to his well-known analysis of the history of human thought, first theologically, then metaphysically, and lastly positively, or as a mere study of facts apart from all preconception. But Comte's acquaintance with social facts was very limited. He discovers the ocean of sociology, but does little to explore it. Herbert Spencer (*q. v.*) is strong where Comte is weak, and perhaps weak where Comte is strong. Spencer's *Principles of Sociology*, as a developed part of his Synthetic Philosophy, did not appear till 1876, but most of his more important positions are already developed in his earlier works. With wide knowledge he undertakes to explain the genesis of all phenomena, mental and natural, in accordance with a universal law of evolution. Mr. Spencer's social theories, however, have not satisfied those who believe that the State should assume more than the simplest governmental functions. Lester F. Ward (*Dynamic Sociology*, vol. i. p. 218) says of Spencer:

"No man probably ever wrote as much as he has written without saying more than the average judgment of mankind could not indorse as soon as presented. . . . Paradoxical as it may sound, and whether it be construed as complimentary or otherwise, Mr. Spencer has too much good sense and too much real knowledge to build a perfect system of philosophy."

The biological conception of society is minutely carried out by the German A. Schäffle (*q. v.*) in his *Bau und Leben des socialen Körpers* (1875), and by the Belgian Guillaume de Greef in his *Introduction à la Sociologie* (1886-89). In the United States, Lester F. Ward, in his *Dynamic Sociology* (1883), develops the same idea without, however, neglecting the psychological phenomena of society; a subject developed later into a book by itself, *The Psychic Factors of Civilization* (1893). Mr. Ward's book is of special importance in reform because of his argument that at a certain point the natural evolution of society passes over into an artificial and teleological evolution, whereby society can consciously affect its own status. Mr. Ward's belief that society can and needs to do this to-day is emphasized by the name of his book, *Dynamic Sociology*—a position, perhaps, contributing to socialism as truly as Mr. Spencer's position opposes socialism. Both logic and merit rank Mr. Ward with the foregoing names, but at least mention should be made of an earlier American who, though not using the term sociology, nevertheless treated sociological subjects with some originality and force—Henry C. Carey (*q. v.*). He published

his *Principles of Social Science* in 1858-60, grouping all phenomena round the principle of association, but somewhat forcing facts to suit his own fancies about association. More recent writers have found various principles as the elementary and distinctive principle of society. Gabriel Tarde (*Les Lois de l'Imitation*, 1890) finds it in imitation; Ludwig Gumplowicz (*Der Rassenkampf*, 1883, and *Grundriss der Sociologie*, 1885) finds it in the conflicts, amalgamations, and assimilations of heterogeneous ethnical groups; J. Novicow of Odessa (*Les Luttes entre les Sociétés Humaines*, 1893) finds it in the variation of conflict and alliance; Émile Durkheim (*De la Division du Travail Sociale*, 1893), finds it in a division of functions creating not only division, but solidarity, ethical and moral as well as economic; John S. Mackenzie (*An Introduction to Social Philosophy*, 1870) elaborates the Platonic or moral-organic conception of society; Professor F. H. Giddings first in numerous articles, and in 1896 in his *Principles of Sociology*, finds that "the original and elementary subjective fact in society is the consciousness of kind" (p. 17). Such, in brief, is the development of sociology up to the present time. We shall now consider its content and main positions, following, for the most part, the outline of the last named author. According to him descriptive sociology comes first, a knowledge of the facts being of necessity preliminary to their analysis. Society is not limited to human beings; most animals are social. The amoeba, the lowest creature known, apparently distinguishes fellow-amœbæ from other objects. Though it is a mere bit of structureless sarcode and has neither stomach nor limbs nor organs of sense, it does not mistake an empty shell for a living diatom. The associations of the ants, bees, and beavers are well known. Among mammals and birds isolated lives are rare. Some degree of aggregation is necessary usually to preserve life in the struggle for life. In his *The Ascent of Man* Professor Drummond has developed the thought that the struggle for the life of others is a necessary concomitant of the struggle for life of self. Say the authors of *The Evolution of Sex* (p. 279), "The activities of even the lowest organisms are often distinctively referable to either category. . . . Hardly distinguishable at the outset, the primitive hunger and love become the starting points of divergent lines of egoistic and altruistic motion and activity." Krapotkine emphasizes the fact played by the social life in animal evolution in his use of Brehm's *Illustriertes Thierleben*. Aggregation is of two kinds: genetic, or by descent from a common ancestor, and congregate, or by the coming together of individuals. The patriarchal theory of the origin of society supposed a genetic basis; the social-contract theory, a congregate basis. Neither is exclusively the case. External physical conditions, as necessity of food and water and protection, compel aggregation. **Association.** Yet the evidence that close interbreeding is injurious is familiar and is generally accepted as conclusive. Aggregation is supplemented

by association, which is mainly a psychical process, beginning in simple phases of feeling and perception, but developed into activities calling out the highest mental power. Association is developed mainly by communication; recognition of kind; by imitation, conflict, material aid, pleasure, or play.

Social intercourse is a mild and normally pleasurable mode of conflict. The factor of imitation gradually assimilates and harmonizes. In the struggles of imitations with one another the strongest imitations survive and produce race and other characteristics. Mutual aid begins in occasional helpfulness and need of defense.

We come next to consider the social mind. This is not an abstract, but a concrete thing.

It exists only in individual minds, and yet is more than any individual mind; it is the phenomenon of individual minds in interaction.

It is seen in temporary manifestations among men and animals, in panics, fads, crazes, mobs, revivals, revolutions, lynching, etc. The same social mind reaches more permanent form through discussion, the press, etc.

It acquires continuity through the social memory or tradition. Tradition is the integration of the public opinion of many generations. Primary traditions are economic, juridical, political, and are developed in this order. Secondary traditions are personal, æsthetic, and religious. Tertiary traditions are theological, metaphysical, and scientific.

In social composition, as developed from aggregation, we find first small groups. Each group is to an extent genetic. Not much social composition is found below the birds, tho nearly all birds live in families. Brehm declared that genuine marriage could be found only among birds. (*Thierleben*, bd. iv. p. 20.)

Groups which are composed of families are either ethnical, that is genetic; or demotic, that is associate. (See FAMILY.)

The composition of demotic societies into villages, towns, counties, States, nations, is well known (*q. v.*). This social composition is psychological rather than physical. The constitution of society is its organization into specialized associations for various social ends. Examples are municipal governments, churches, schools, industrial corporations, societies, clubs, etc. In the tribal society composition and constitution are substantially identical.

In civilized communities the constitution of society is like a great circle with numberless small circles within it. Socialists are right in saying that the State could do all; individualists are right in saying that society could get on without Government; but neither is the normal development. The end of society is the evolution of the rational and spiritual personality of its members. Cultural associations develop this and are religious, educational, scientific, ethical, æsthetic, or what is called polite society. Economic, legal, and political associations exist in a functional sense for the sake of cultural organization and activity. Psychologically the social constitution is the exact opposite of the social composition. It is

an alliance of the like and the non-toleration of the unlike in each simple association, supplemented by toleration and consideration of the unlike in complex association.

Historical sociology, Professor Giddings divides into four parts. **Historical Sociology.**

(1) Zoogenic association (association of animals) long preceded the association of men and deeply affected animal life. Indeed we may say that association or society has been the supreme element in the struggle for existence. It was Mr. Darwin's dictum that "those communities which included the greatest number of the most sympathetic members would flourish best" (quoted in Drummond's *The Ascent of Man*, p. 233). Krapotkine says, "Sociability is as much a law of nature as mutual struggle" (*Nineteenth Century*, 1890, p. 340). Herbert Spencer says of the ethical bearings of altruistic principles (*Principles of Ethics*, vol. ii. p. 5), "Animal life of all but the lowest kinds has been maintained by virtue of them. Excluding the *Protozoa*, among which their operation is scarcely discernible, we see that, without *gratis* benefits to offspring and earned benefits to adults, life could not have continued."

"The ant," says Krapotkine, "thrives without having any of the 'protective' features which cannot be dispensed with by animals living an isolated life."

"In their societies parrots find infinitely more protection than they possibly might find in any ideal development of beak and claw. Horses, badly organized on the whole for resisting both their numerous enemies and the adverse conditions of climate, would soon have disappeared from the surface of the earth were it not for their sociable spirit. When a beast of prey approaches them several studs unite at once, . . . and when a snow storm rages in the steppes, each stud keeps close together and repairs to a protected ravine. . . . Life in societies enables the feeblest insects, the feeblest birds, and the feeblest mammals to resist or to protect themselves from the most terrible birds and beasts of prey. . . . We maintain that under any circumstances sociability is the greatest advantage in the struggle for life." (Krapotkine, *loc. cit.*, pp. 7-11.)

(2) But after zoogenic comes anthropogenic association. There is here, however, no break. Society produced man rather than man society. The ape-like forerunner of man is social. (See Darwin's *Descent of Man*, p. 180.) Language is necessary to human development and society is necessary to language. Most evolutionary thought here has gone astray. Mr. Fiske argues that social development followed from prolonged infancy, but this forgets that association must precede prolonged infancy. The brain is the result of association and man the creature of social life, rather than social life the work of man.

Mr. Lester F. Ward (in *American Anthropologist*, vol. viii. No. 3, July, 1895) also argues that "man's erect posture is chiefly due to brain development," and that his psychologic evolution is to be explained largely by association.

Such is this view of the genesis of the human species, in society, rather than of society from man, tho Mr. Giddings reminds his reader that the conclusions are yet merely hypothetical. Economic ideas, even of tools, political ideas of toleration and obedience and of kinship, have their beginnings in the animal world. Characteristic of the beginnings of human society were the primitive explanations

and traditions of life, death, and causation, as animism and the ghost theory.

(3) Coming now to ethnogenic associations, we find that self-consciousness is that which distinguishes human from animal communities. At first, however,

Ethnogenic Association. the social constitution is not differentiated from the social composition.

The first groups were probably formed of family groups. At the same time, the relations of the sexes may have been the loosest. The family relation can and probably did coexist with the greatest sexual irregularities, especially at the great gatherings and festivals. The trading and lending of wives was common. It is probable that the domestic group was simply a monogamous family, mainly the result of male jealousy and power, as held by Darwin and Maine; with polyandry and polygyny the exception. (See FAMILY.) The male probably often deserted the female with her children, and they would know only the mother, thus accounting for the metronymic clan. The union of hordes produces the tribe, and the union of tribes an ethnic nation. In horde, clan, or tribe, chieftaincy can become hereditary; the clans are the juridical organization; the phratry is the religious organization guarding the religious tradition. Its secret societies of medicine-men give the germs of the professional class; the sachems elected by clansmen and clanswomen are the first judges. Chieftains become the founders of a nobility. There results a feudalism (*q. v.*) which prepares the way for another system.

In demogenic associations the social composition is subordinate to a developed social constitution. It has three stages. In the first, all the energies of society are concentrated upon political integration and defense, as in Egypt and Babylonia; in the second, there is a critical effort to achieve the union of personal liberty with stability through the constructive evolution of municipal and constitutional law. Greece failed in construction and Rome sacrificed spontaneity to system. This stage went on through the Middle Ages, the Reformation, the French and American Revolutions. The third stage is industrial. The development of the fundamental social interests thus reverses the order of their genesis.

We found that there were three fundamental social traditions—economic, legal, and political—evolved in this order. But when society, building on these traditions, reaches the political stage it puts its social energies into perfecting that first,

Philosophy of History. and then works back and perfects its legal and then its economic life. So with the secondary traditions of the personal or animistic,

the esthetic and religious. When society has reached the political stage it has by no means perfected its secondary traditions, and therefore, in so far as it busies itself with intangible concerns, it interests itself in religion, then in art, then in personal interests.

The tertiary traditions, however, follow a different order. In the religious-political age the human mind is theological: in the critical

age it is metaphysical; only in the economic and spiritual age it is scientific. The stages of civilization are then military, religious, and theological; liberal, legal, and metaphysical; finally, economic, ethical, and scientific.

In this philosophy of history will be seen both the basis and the inadequacy of Comte's trilogy of the theological, the metaphysical, and the positive; of Hegel's conception of the evolution of the personality of man, disregarding the stages of society; and Mr. Spencer's evolution of society in terms of differentiation of structures, and finding only two types, the military and the industrial.

Ethnic societies that have reached the age of confederation and kingship become lawless and aggressive. Migration and conquest result. The great historical races are the result of the superposition of races upon races, as in Egypt.

As a result of such conquests society becomes mingled, sovereignty is developed, the social constitution becomes more than the social composition, life and property become more secure than in nomadic days; wealth develops, trade flows to centers, division of labor between city and country grows. Traders come and outdo in wealth the older population. The problem is to incorporate, under political form, congregate societies. The genetic form of society gives place to the civil. Church and State are organized. Ethnic unity, however, is not lost. Territory is more thought of. Political integration goes on. Strong States absorb the weak. The community, too, reacts on the individual. Gradually the military state is outgrown. Natural selection favors those adapted to the dominant social characteristics. Selection, for example, has produced the American spirit, with its desire for change, its love of experiment, and its respect for enterprise. The legal and critical age is born. Voluntary organization, under the authority and protection of law, assumes endless variety. It produces personal liberty. There is much inherent democracy in mere numbers. But the development of liberalism disintegrates the social composition. The religious-proprietary family is weakened. Liberalism substitutes contract for custom. The authority of the parent is weakened. The family becomes romantic and unstable. Liberalism, too, weakens the State, but it increases wealth and introduces the industrial age. Increase of wealth multiplies population, if not by increasing the birth-rates, by decreasing death-rates. The corrected Malthusian formula is: "In any given state of industry and the arts population tends to increase faster than it is possible to raise the general plane of living." This quickens invention and industrial progress begins anew. Invention is rhythmic. Spencer is right (*Principles of Biology*, vol. ii. pt. 6), as Professor Lavasseur, M. Dumont, and Miss Brownell have shown that the birth-rate diminishes as individual evolution increases. This is partly the result of physiological changes, but mainly the

Malthusianism.

result of psychological reasons. There is a deliberate prevention of births. The "preventive check" has come into general use, as in France and New England. But this proves not the falsity, but the truth of Malthusianism. It gives indubitable proof that population feels the tendency to increase faster than it is possible to raise the general plane of living. Demogenic association develops classes and the class struggle. Disintegration of the social constitution shows itself in the city; savagery threatens the cities, but first private philanthropy, and then communal intelligence, awaken ethical character and effort and check the savagery. Society thus becomes more reflectively self-conscious and studies more the possibilities of both free contract and authority.

This leads us to the study of explanatory sociology, or the consideration of social law and cause. The initial causes of society are physical, but association furthers survival and happiness, and develops the conscious individual and the conscious society. Relations and activities are valued, choices are made, policies are devised, institutions founded. Natural selection works among these. The further task of sociology is to discover and use the details and laws of these complicated processes. Society is often described as an organism, but it is more. It is essentially psychical. It is more than a multitude of individual minds. Personality is a unity, but it is not indivisible or undecomposable.

Undoubtedly the individual will plays a large part in human life, but the question is whence comes the individual will. Sociology, as a science of natural causation and natural law, declares emphatically that the individual is, at least to a very large extent, the product of environment, including the social will. Man is a variable, but not an independent variable. The theory of natural rights is given up to-day by science, but there are norms of rights, socially necessary laws, which science is beginning to discover. Society is a psychological organization rather than a physical organism. Sociology then teaches that the struggle for life brings individual beings into a certain amount of aggregation; that a consciousness of kind begins in the earliest animal life; that the struggle for life is aided in the earliest stages by what Drummond calls the struggle for the life of others; that thus from aggregation there comes a more or less conscious association; that this reacts upon and develops the individual; that a social mind is developed, and eventually expressed in social purpose and control; that there follows a struggle for existence between, and a survival of, the fittest social institutions, and thus we have the persistence and coexistence of the highest personality and the highest social organization.

Society is not a physical organism, but it is a psychological organization of conscious organisms.

SOETBEER, ADOLPH, was born in Hamburg in 1814, and, taking his degree at Göttingen, entered the education department of the city of Hamburg, and later the Hamburg Deputation of Commerce, in which position he became an authority on financial questions. He is called "the father of German gold coinage," yet he regrets the decline in value of silver and favors the adoption of one gram of fine gold as an international unit of value, the coinage of gold to be free, on payment of a seniore, but no gold coin containing less than 5.8065 grams of pure gold to be minted. All nations are to coin silver in the ratio of 20 to 1, but its coinage is not to be free.

The author of numerous works, he is best known for his tables of prices.

SOMERSET, LADY HENRY, is the daughter of Earl Somers of Eastnor Castle, Herefordshire, a descendant of Lord Somers of Evesham, to whom William of Orange gave Somerset in St. Pancras, London, and also the town of Reigate. Her maiden name was Somers-Cocks. Lady Henry Somerset is half French on her mother's side, her great-grandmother having been maid of honor to Queen Marie Antoinette. Her father had for his tutor the Rev. Frederick D. Maurice, and was the friend of Turner, Ruskin, and Layard; the intimate of Cavour, Garibaldi, and Mazzini.

Lady Henry was born in London in 1851. She was married in 1872 to Lord Henry Somerset, the second son of the Duke of Beaufort.

Her only son and child was born in 1874, Henry Somerset, heir presumptive to the Dukedom of Beaufort. For some years Lady Henry was often at court, and a leader in the fashionable society of London, but this position was not congenial to her tastes.

Leaving London in the year 1878 for one of her father's beautiful country places, she remained there for many years in comparative retirement with her son, between whom and herself there has always existed the most affectionate relationship. In 1884 Lord Somers died, leaving Lady Henry Somerset heir to Eastnor Castle, Somers Town (London), and Reigate, and only grieving that the laws of Parliament prevented his eldest daughter from succeeding to his title. The responsibility of administering an estate involving a tenancy of more than one hundred thousand persons deeply impressed the mind of Lady Henry Somerset, and in a crisis hour she seemed to hear a voice saying to her as she sat under her favorite elm tree in the Priory gardens: "Act as though God were and thou shalt know He is." This was in the spring of 1885, and that hour marked the turning point of her destiny, for she renounced society, broke away from her former relationships at the cost of criticism and alienation, and went with her son to Eastnor Castle, one hundred miles from

London, where for five years she lived among her tenantry without comradeship of any kind save as Christian workers, whom she invited, came and went from time to time. She studied her Bible with conscientious care, and held her first religious meetings in the kitchens of the farmers and the barns where the hop-pickers gathered. She built chapels, hired missionaries, held meetings for the miners in Wales near where she had spent some years of her married life, and in every way improved the condition of those dependent upon her. Mrs. Hannah Whitall Smith, an American lady and a leader in the Woman's Christian Temperance Union, came to Eastnor by invitation, and from her Lady Henry Somerset heard the history of the crusade in Ohio, the organized movement which followed it, and the wide sweep of the World's Woman's Christian Temperance Union. By Mrs. Smith's request, Lady Somerset consented to accept the presidency of the British Woman's Temperance Association, which had been founded as the result of a visit made by Mother Stewart to Great Britain in 1876. This was in 1890. In 1891, accompanied by her son and his tutor, Lady Henry with Mrs. Hannah Whitall Smith, came by invitation to the first convention of the World's Woman's Christian Temperance Union in Boston, Mass., presided over by Miss Frances E. Willard. She was so deeply impressed by the White Ribbon women and their work that she remained six months in America, being associated with Miss Willard in the editorship of the *Union Signal*, the organ of the women's White Ribbon movement.

In April, 1891, Lady Henry Somerset returned to London to preside over the annual meeting of the British Woman's Temperance Union. In August of that year Miss Willard lost her mother and went to Eastnor Castle. In October both of these temperance leaders made a voyage to the United States and traveled to Denver, Colo., to conduct the annual meeting of the National Woman's Christian Temperance Union, returning a few weeks later to England where, by their united efforts, the British Woman's Temperance Association was reconstructed on the lines of the modern temperance movement as illustrated in the World's Woman's Christian Temperance Union, the central idea of which is to correlate the temperance movement with other reforms such as the enfranchisement of women, the labor movement, the social purity movement, all of which are inextricably intertwined with the temperance reform itself.

In the previous year, 1892, Lady Henry had assumed the editorship of a London paper called *The Woman's Herald*, but in 1894 the name was changed to *The Woman's Signal*. It is now the leading woman's paper of Great Britain in the world of philanthropy and reform.

She is strongly opposed to all organizations and declarations in which "profession mocks performance." She has more and more connected herself with the labor movement and with a practical "Christian Socialism."

FRANCES E. WILLARD.

SOUTH CAROLINA DISPENSARY SYSTEM.—In 1890, in South Carolina, U. S., the people of the State, weary with the domination of the political machine of that State, the spread of drunkenness and the power of the saloon, elected B. R. Tillman Governor, and temperance men to almost all the offices. In 1892 a prohibition proposition was presented to the people of the State and was carried. In some counties, however, it had been already tried and was said to be a failure. When saloons were closed, whisky was sold by the drug stores. Therefore, instead of prohibition, Senator J. G. Evans introduced into the South Carolina Legislature a so-called Dispensary Law, according to which all saloons were to be closed in six months, and no whisky was to be sold except by government dispensaries under strict control. The law was passed, and a special force of constables appointed to enforce it. July 1, 1893, the law went into effect. Meanwhile, most of the saloons had closed. In some places, however, the law was resisted as unconstitutional. Many Prohibitionists, and some other temperance reformers, condemned the law, and even sided with the liquor interest against it. In Darlington the constables who tried to enforce the law were resisted. Governor Tillman, who had everywhere vigorously enforced the law, now called out the militia, and the part of the militia refused to obey, he succeeded in putting down the revolt. At this juncture, however, the Supreme Court of the State decided the law unconstitutional, on the ground that part of the liquor trade was justifiable and the inalienable right of the individual, while the State had no right to enter a business for profit. It was left uncertain whether the alternative to the law was free whisky or protection. Later, the court decided for protection, but in many parts of the State this was ignored and the saloons opened. August 1, 1894, however, Governor Tillman issued a proclamation reinstating the Dispensary Law, and Mr. E. B. Gary having succeeded Associate Justice McGowan on the Supreme Bench, when a case was tried, the Dispensary Act was declared constitutional on the ground that the traffic was demoralizing and the State had the right to protect itself. Since then, tho the legal issue is still uncertain, the law has been enforced by a State Board of the Governor, Attorney-General, and Comptroller-General. Only pure whisky is sold. Dispensers must be men of sobriety and honesty. No whisky is sold to minors or inebriates. No whisky can be bought indirectly for others, and none can be drunk on the spot. Dispensaries are open only from 8 A. M. to 6 P. M. There can be no attractive connections of billiards, pool, etc. The dispensers are salaried and have no interest in the sale. Says the New York *Outlook* of May 11, 1895:

"The dispensary system seems to be firmly established in the approval of the people of the State. Nearly all our information concerning its workings has come from hostile or critical sources; yet the hostile source—the columns of the *News and Courier*—has given increasing evidence that the law against

private dram-shops is rigidly enforced throughout the State; while the critical source—the testimony of the correspondents of the *Voice*—has from the first declared the law a success. The following editorial paragraph from the current number of the *Review of Reviews* (written by Dr. Shaw after a visit to South Carolina) seems to express the conclusion which every impartial investigator must reach:

“The people of South Carolina, outside of the old liquor interest and certain political circles, have become almost unanimous in the opinion that the system is a splendid success. Governor Evans, when in the legislature, was the chief promotor of the Dispensary Law, and now that he is in the executive chair he is quite as staunch in maintaining and enforcing the system as was Governor Tillman. Railway roadmasters, and other men familiar with conditions throughout the State, are enthusiastic in their account of the good effects that the law has already produced. Drunkenness and disorder have decreased to a remarkable extent; and whereas the negro laborer was formerly accustomed to spend his week's earnings in carousing on Saturday night and Sunday, he is now spending more upon his family, or else saving his money to buy land. The ten or twelve State dispensaries in the city of Charleston, which have taken the place of scores or hundreds of saloons, are as openly conducted and as orderly as any drug store, and are absolutely closed at sundown. The effect upon the quiet and order of the city has been too transforming to admit of any denial. Reports from country towns throughout the State are to the effect that the closing of the old bar-rooms in favor of the new dispensaries has been attended with results that have converted almost every good citizen to a belief in the present system. In view of the widely circulated reports in disparagement of the South Carolina dispensaries, these facts ought to be given a wide publicity.”

(For Prohibitionist objection to the dispensary system, see article on the somewhat similar NORWEGIAN SYSTEM.)

Other countries are adopting the same system. Russia has determined to gradually abolish all saloons in her vast domain between July 1, 1896, and January 1, 1898, and to make the liquor traffic a government monopoly. The object is not revenue but temperance. Says the Russian journal *Virdomosti*:

“The object of government monopoly of the sale of liquor is principally to do away with the abuses of liquor-dealers who take advantage of the disposition to drunkenness. To say nothing of the fact that the liquor-dealers are generally also usurers who manage to enslave the population, they try to encourage drunkenness and to make a saloon a necessity to the people. They gladly deal on a credit basis and take all kinds of household goods as security. The law, to be sure, prohibits this, but it is notorious that the saloon-keepers obtain most of their income by evading the legal restraints. Government sale, on the other hand, aims at the substitution for drunkenness of a normal consumption of liquor. Equally important is the influence of government monopoly upon the improvement of the quality of the liquor manufactured.”

Switzerland made the sale of *alcohol* a government monopoly December 23, 1886. Only pure quality is sold and under strict control. The profits are divided between the cantons for education, including temperance education. The revenue for 1894 was \$965,000. A decrease in consumption is claimed of 25 per cent., tho there has been some increase in the use of beer and wine. France has also voted a government monopoly of all drinks stronger than light wines and beer.

SOUTH SEA BUBBLE.—In 1711 a South Sea Company was founded in England by the Earl of Oxford, and received, in 1720, a monopoly of the South Sea trade and interest from the government at 6 per cent., in return for which it was to take over the na-

tional debt of £30,000,000. Millions of stock were issued and amid the intensest excitement the stock reached, at one time, £1000. For eight months the “bubble” lasted and then broke. There was general panic and indignation, and Parliament fined the directors \$10,000,000.

SOVEREIGNS OF INDUSTRY, THE.

—This was an order established in New England January 6, 1872, to develop cooperative stores for the working-classes similar to the cooperative movement started by the Grange (*q. v.*). Its leaders were William Earle and John Orvis. Many stores were started and much interest was taken, but the stores, which were to sell at cost, were undersold and run out by competition. Later they introduced the Rochdale system advocated from the first by Mr. Orvis, but it was too late, and the order failed about 1879, tho a few stores survived (see COOPERATION).

SOVEREIGNTY in political science Professor Burgess (*Political Science and Constitutional Law*) defines as “original, absolute, unlimited universal power over the individual subject and over all associations of subjects.” Jellink defines it as “obligation through its own will.” It is the most essential principle of the state. (For the development of the idea of sovereignty, and the views of it held by different writers, see articles POLITICAL SCIENCE and STATE.) Sovereignty, according to most modern writers, though not all, is based upon force. “The one thing that characterizes the State is coercive power” (Leroy Beaulieu, *The Modern State*). “Force is an absolutely essential element of all laws whatever” (James Fitzjames Stephen, *Liberty, Equality, and Fraternity*). “Penal sanction is the essence of law” (John Stuart Mill, *Utilitarianism*). “Let the edifice of law be as moral and effectual as you will, its foundation is the force of the community” (Goldwin Smith, *Essays on Questions of the Day*).

Other thinkers, however, deny this. Bluntschli distinguishes between force and power. Woodrow Wilson calls sovereignty “a catalogue of influences.” Lieber calls it “the sense and sentiment of the community.” Hume says that government is founded on opinion, and “that force is always on the side of the governed.” Austin says, “the monarch is superior to the governed . . . to an indefinite tho limited extent.” (For the relation of sovereignty to liberty, see STATE.)

SPAHR, CHARLES B., was born in Columbus, O., in 1860. He was graduated at Amherst College in 1881 and was given the degree of Ph. D. by Columbia in 1886. Studying also in Europe he became in 1886, and has been ever since, assistant editor of *The Outlook* of New York. From 1889 to 1891 he was on the editorial staff of *The Commercial Advertiser*, and in 1890 was lecturer on Taxation and the Distribution of Wealth at Columbia University. Besides various articles in economic reviews he published, in 1896, *The Present Distribution of Wealth in the United States*. (See WEALTH.)

SPARTACUS, a Thracian by birth and perhaps of royal stock, served in the Roman army, but is said to have deserted and to have been captured and made a gladiator. But in 73 B. C. he, with a band of fellow-gladiators, broke out of a training school at Capua, and taking refuge on Mt. Vesuvius, rallied round him thousands of slaves. He defeated Claudius, sent against him with 3000 men, and also Varenius and others, and, last of all, Manlius with 20,000 men. Spartacus tried to lead his forces out of Italy, but they would not go. Division arose, and Crassus finally conquered them. Six thousand of them were crucified on the road from Rome to Capua. Spartacus himself fell in battle.

SPECIE PAYMENTS. See MONEY.

SPENCE, THOMAS, was a London bookseller who advocated the "parochializing" of land "so that there shall be no more nor other landlords in the whole country than the parishes." In 1775 he read a paper on land nationalization before the Philosophical Society in Newcastle, and was thereupon expelled from the Society. He seems to have been also prosecuted by the government for selling seditious literature. Among other reforms he advocated a kind of phonography. His Newcastle paper has been recently republished by Mr. Hyndman (*q. v.*).

SPENCER, HERBERT, was born at Derby, England, in 1820. His father was a schoolmaster of original character and strong views. The boy was delicate and backward in early studies; was placed in 1833 under the care of his uncle, the Rev. Thomas Spencer of Hinton, a clergyman of the Church of England, but of somewhat radical views, and a vigorous advocate of social reforms. In 1837 Herbert Spencer was articled to a civil engineer, and worked on the London and Birmingham Railway. In 1845, however, he moved to London and began his literary career. In 1842 he had already written, in the *Nonconformist*, a series of papers on *The Proper Sphere of Government*. From 1848 to 1852 he wrote on the *Economist*, and in 1850 published his *Social Statics*, the radicalism and brilliancy of which gained him friends like Huxley (*q. v.*) and George Eliot. In 1855 appeared his *Principles of Psychology*, by many considered his greatest work. Already interested in the unity of sciences and in the evolutionary philosophy, he projected in 1859 an entire system of philosophy, to the development of which, in volumes on different portions of the subject, he has directed his life. *First Principles* appeared in 1862; *The Principles of Biology* (2 vols.); *The Principles of Psychology* (2 vols.); *The Principles of Sociology* (3 vols.); *The Principles of Ethics* (2 vols.) have followed at different periods; the last volume of the *Principles of Sociology* only appeared in 1896. In all these works he argues, with large learning and great ability, that all phenomena of matter and of mind, all motion and all force, proceed on a law of gradual development, from the general to the particular, from a simple homogeneous uniformity to a complex heterogeneous multiformity. This evolution

proceeds, he argues, on laws of natural struggle for existence, of natural selection, and the resultant survival of the fittest. The same general principles he has worked out on many detached subjects, in his *The Data of Ethics*, a part of his *Principles of Ethics* (1879), *Education* (1861), *The Study of Sociology* (1872), *Descriptive Sociology* (1873-78), *Justice* (1891)—several essays in which he bitterly attacks the socialist tendencies of the day. *The Coming Slavery*, *The Great Political Superstition*, *The Sins of Legislators*, *The New Toryism*, have been collected under the title of *Man vs. The State*.

For a discussion of Mr. Spencer's sociological views see articles EVOLUTION and SOCIALISM. Mr. Spencer has advocated his views with such power that he is sometimes called the philosopher of the century; but his influence is to-day distinctly waning in university circles, while his later utterances in *Justice*, disowning his former position taken in *Social Statics*, chapter viii., 1st ed., that equity does not allow private property in land, has much hurt his influence among the masses. His present view is that, tho absolutely equity does not allow private property in land, to nationalize land without compensation would be wrong, since society has allowed private ownership, and that, with compensation, to nationalize land would do no good. In his *Social Statics*, however, he asked, How long it took a wrong to grow into a right?

Many writers, like Huxley and Ritchie, have accused Spencer of inconsistency in seeing the necessity of the subordination of the part to the whole in the bodily organism, but not in the social organism (see EVOLUTION); but he remains a steadfast foe of all steps even tending toward socialism. (See INDIVIDUALISM.) The general fundamental proposition of his individualism he has thus stated:

"The sphere of existence into which we are thrown not affording room for the unrestrained activity of all, and yet all possessing, in virtue of their constitutions, similar claims to such unrestrained activity, there is no course but to apportion out the unavoidable restraint equally. Wherefore, we arrive at the general proposition that every man may claim the fullest liberty to exercise his faculties compatible with the possession of like liberty by every other man" (H. Spencer, *Social Statics*, chapter iv.).

SPIES. See CHICAGO ANARCHISTS.

SPOILS SYSTEM.—This is the name usually given to the custom of considering the bestowal of public offices, by the party in power, on the partisans of the party as a reward for service to the party in elections, etc. It develops rings, bosses, and corruption. (For further consideration of it, see CIVIL SERVICE REFORM.)

STANDARD OF COMFORT.—Many men believe that wages depend on the standard of comfort of the class of men receiving the wages. They argue that if wages fall materially below what will enable men to maintain their "standard of comfort," they will usually strike or agitate in some way for higher wages,

that, on the other hand, if wages are high enough to maintain their standard of living, they will remain usually content; and therefore, that the way to raise wages is to raise the standard of comfort, while all that tends to make living cheaper tends, other things being equal, to lower wages. (For a full discussion of this, see SHORT-HOUR MOVEMENT, also WAGES.)

STANDARD OIL MONOPOLY.—This famous monopoly originated in the South Improvement Company, organized January 2, 1872, to control the carrying of oil. It agreed to furnish the Pennsylvania, Erie, and New York Central railways a fair division of freight traffic and was to receive a secret rebate of from 40 cents to \$3.07 per barrel, and was guaranteed "against loss or injury by competition." A storm of opposition arose. The plan failed, but the idea remained, and the Standard Oil Company was formed to carry out the idea, and by 1874 had the railways committed to its interests. With this start the company gradually grew till it became a complete monopoly, built an oil pipe to the seaboard, went into the refining business, and destroyed all competitors. It has been relentless and without scruple in the attainment of its ends. We give some instances,

In Mr. H. D. Lloyd's *Wealth Against Commonweal* (pp. 243-298) he shows how the magnates of the Standard Oil monopoly were indicted as sharers in a conspiracy to blow up the oil-works of a competitor, involving loss of life as well as property. A grand jury found that the facts warranted indictment. This was quashed on technical grounds. A second grand jury agreed with the first, and the magnates were brought to trial. They got the ablest lawyers to defend them. Among them were the lawyers who made the speeches nominating Mr. Cleveland for sheriff, mayor, Governor, and President. The oil magnates treated the matter as a huge joke. They were put on trial, but after the affair had gone a little way, a lawyer moved that the magnates be discharged from the trial, and the trial be limited to the resident managers of the local company accused of plotting the blowing up of the rival works. The judge then announced that he had decided to grant the discharge. The case, therefore, as far as these magnates were concerned, did not go to the jury. Against the local managers it went on, and on May 18, 1837, they were found guilty. A stay, however, was granted by the judge till December. The judge, however, later decided against a new trial, and the case was carried to higher courts. When the time for trial came on petitions for mercy were circulated in Buffalo and Rochester. Six of the jury were induced to sign a recantation. The district attorney offered later in court to show that they were bought. Finally, however, sentence was pronounced; the lightest which the law allowed, a fine of \$250. The judge gave this light judgment, he is reported by the Buffalo press to have said, because it had come to his attention that civil suits had been brought against the managers to recover damages for these same overt acts, and he did not desire to punish them twice for the same offense. But when they were tried for damages they were released because they were to be punished criminally. In 1839 this judge was renominated for the judgeship, the presiding officer of the convention being president of a great railway. The nomination was procured, said the *New York Times*, by the influence of the oil trust. The papers took it up and he was defeated; but a year later he was nominated by both parties for a seat in the Supreme Court of New York and was elected for 14 years to try questions affecting trusts, corporations, etc.

The Standard Oil Company unquestionably bought the election of Henry R. Payne as Senator for Ohio. The people did not even know he was a candidate. Up to the time of election two-thirds of the legislature were for George H. Pendleton or General Ward. But contrary to all precedents the caucus of the majority

party was not held till the night before the election, to give no time between the caucus and the election. Contrary to precedents, too, the nomination was made not by open but secret ballot, and without debate. The people of Ohio were thunderstruck to find that the enemy of the people had been elected their Senator. Explicit charges of corruption were named. The names of legislators who had been bought were made public, with the price paid. Members of the legislature openly stated that they had received \$5000 for their votes. The scandal was made an issue in the next election and a legislature was chosen which would investigate the election. The result was that the House resolved that "ample testimony was adduced to warrant the belief that . . . the seat of Henry R. Payne as Senator of the United States from Ohio was purchased by the corrupt use of money," and the Senate charged that the election "was procured and bought by the corrupt use of money . . . and by other corrupt means and practices." Accusations were laid before Congress, but the case was finally hushed up. Such are some of the sample deeds of the Standard Oil monopoly, full proof of which, together with other points, such as their influence in Congress, and even in Mr. Cleveland's Cabinet, will be found in Mr. Lloyd's remarkable book, *Wealth against Commonweal*. It is claimed that the monopoly has done good because it has lowered the price of oil. It is true that the price has fallen, but whether this is due to the Standard Oil Company is an open question. Probably such monopolies do tend to cheapen production, but the question is whether such powers can be trusted in a democratic state, and whether under public monopoly we cannot have all the advantages of combination without the presence of such corrupting corporations. It is also claimed that the Standard Oil monopoly has simply carried out on a large scale what many corporations do in a smaller way, and this is probably true. The Standard Oil monopoly was attacked in the courts of Ohio and dissolved as illegal, but it has simply re-organized under another form, and is to-day stronger than ever.

STANTON, ELIZABETH, née CADY, was born at Johnstown, N. Y., in 1815. In 1840 she married Henry B. Stanton, reformer, author, and State senator. Attending the World's Anti-Slavery Convention in London she met Lucretia Mott. Till 1847 she resided in Boston, Mass., but then removed to Seneca Falls, N. Y., and in 1848 she signed with Lucretia Mott the call to the first Woman's Rights Convention, which met July 17, 1848. She has devoted her life to this cause, addressing meetings, attending legislative hearings, and circulating petitions. She has thus worked in the United States, Great Britain, and France. She canvassed Kansas in 1867, and Michigan in 1874. She was President of the National Association till 1892. She was president of the first International Council of Women, held at Washington in 1888.

STATE, THE.—The State, says Professor Burgess (*Political Science and Constitutional Law*, vol. i. p. 51), is "a particular portion of mankind viewed as an organized unit." With this general definition in mind we shall in this article briefly trace the development of the ideal of the State. (For the actual historical development of organized society, see articles SOCIOLOGY; PRIMITIVE PROPERTY; and FAMILY.)

The conception of the State which first prevailed in Asia and also in Greece recognized it as a natural part of the world, and, like the world, the gift of the gods. The Asiatic kings claimed to rule by right divine, and usually to be descended from the gods. The Greek City-State was considered of divine origin. The State represented to them the moral order of

the world, in which human nature fulfils its end. The State was not a machine, but an end in itself.

Plato says (*Rep.* v. p. 462), "The best State is that which approaches most nearly to the condition of the individual. If a part of the body suffers, the whole body feels the hurt and sympathizes altogether with the part affected." Aristotle declares that "man is by nature a political animal," and says (*Pol.* iii. 9 § 14) the State is "the association of clans and village communities in a complete and self-sufficing life." "The State," he says (*Pol.* i. 2 § 8), "comes into being for the sake of mere life, but exists for the sake of the good life." The Greek State is all in all. (See ATHENS.)

The Roman ideal follows Greek models, but with the Roman genius for jurisprudence conceives of law as the creature of the State, and the State as based on the assent of the people. Cicero (*De Rep.* i. 26) says the State is "the people organized." In the Middle Ages we have Greek ideals, Roman jurisprudence, Germanic personal liberty, all blending with Christian teachings. Both Church and State are conceived as coming from God. Which is supreme? This is the problem of the Middle Ages. We have also attempts, characteristically based on the Bible precedent of the covenant of King David with the elders of Israel, to show that the State rests on the consent of the people. We have finally Saxon love of personal liberty, placing the individual as the center and not the State, giving the germs of constitutional government. Feudalism, with its personal element, its homage and service, is the characteristic form. Gradually from this develops the centralized State, and Machiavelli at the beginning of modern times concerns himself with the policy of kings. Bodin sees in the State "a right government, with sovereign power, of several households and their common possessions." Grotius calls the State "the complete union of free men who join themselves together for the purpose of enjoying law and for the sake of public welfare." This is the transition to the contract theory. With Protestantism and the dawn of modern freedom the individual is sovereign. The State is a compact between sovereign individuals. With Hobbes, however, individuals have contracted with each other to give over their rights to some sovereign power, and henceforth, having given over their rights, must absolutely obey the sovereign. He says (*Leviathan*, Morley ed., p. 84):

"The State is established by a covenant of every man with every man in such manner as if every man should say to every man, 'I authorize and give up my right of governing myself to this man or to the assembly of men on this condition, that those give up their right to him and authorize all his actions in like manner.' This done, the multitude so united in one person is called a commonwealth, in Latin *civitas*. This is the generation of that great 'leviathan,' or rather to speak more reverently, of that 'mortal God' to which we owe, under the immortal God, our peace and defense."

With Locke the State is also the result of a contract, but the individuals retain their sovereignty and we have constitutional government, and the people can judge the king. Rousseau carries the doctrine of individual sovereignty, of the social contract, and of natural rights to their logical extremes, and leads

us to the French Revolution. (See NATURAL RIGHTS.) In America the same doctrine has led to the various bills of right and the limitation of government to that which the people expressly allow the government to do in their charters and Constitution. The result is the tying of the hands of legislation by the dead hand of constitutions framed for other days and only with the greatest difficulty to be changed. (See CONSTITUTION and CONSTITUTIONALISM.)

Revolting from the results of the French Revolution, the historical school denied that the State was in any such sense the result of a contract. Savigny (*System des röm. Rechts*, i. p. 22) calls the State "the bodily form of the spiritual community of the nations," or "the organic manifestation of the nation." Burke says (*Reflections on the Revolution in France*):

"Society is indeed a contract. Subordinate contracts for objects of mere occasional interest may be dissolved at pleasure. But the State ought not to be considered as nothing better than a partnership agreement in a trade of pepper and coffee, calico or tobacco, or some other such low concern, to be taken up for a little temporary interest and to be dissolved by the fancy of the parties. It is to be looked upon with other reverence, because it is not a partnership in things subservient only to the gross animal existence of a temporary and perishable nature. It is a partnership in all science, a partnership in all art, a partnership in every virtue and in all perfection. As the ends of such partnership cannot be obtained in many generations, it becomes a partnership not only between those who are living but between those who are living, and those who are dead, and those who are to be born. Each contract in each particular State is but a clause in the great primeval contract of eternal society."

Buckle strives to explain the State by a consideration of the forces of nature. The Germans have developed a more ideal conception of the State. Kant calls it "a collective being" (*Werke*, ed. Rosenkranz, vii. 197). Hegel says, "The State is the realization of the moral idea. It is the moral spirit as substantial will." Bluntschli, uniting the German idealism and the modern historical view, says (*The Theory of the State*, tr., bk. i. chap. 1): "The State is a combination or association of men, in the form of government and governed on a definite territory, united together into a moral organized masculine personality; or, more shortly, the State is the politically organized national person of a definite country." The present tendency in England and America is to discard all abstract theories of natural rights and to ask what is the actual content of the State idea. Hence Professor Burgess' definition, as quoted above, "A particular portion of mankind viewed as an organized unit."

Bluntschli finds as necessary to the concept of a State (1) a number of men, (2) a fixed territory, (3) unity, mainly developed by history, (4) an organic nature, (5) a moral and spiritual character, (6) a masculine personality. He says, "The highest conception of the State—which, however, has not yet been realized—is humanity organized."

Professor Burgess (*Political Science and Comparative Constitutional Law*, vol. i.)

considers as "the peculiar characteristics of the organization which we call the State" (1) that it is all-comprehensive. "Its organization embraces all persons, natural or legal, and all associations of persons." (2) It is exclusive. "Political science and public law do not recognize the existence of an *imperium in imperio*." (3) It is permanent. "It does not

lie within the power of men to create it to-day and destroy it to-morrow, as caprice may move them." (4) The State is sovereign. "This is its most essential principle."

Concerning sovereignty Professor Burgess says:

"I understand by it original, absolute, unlimited, universal power over the individual subject and over all associations of subjects. This is a proposition from which most of the publicists down to the most modern period have labored hard to escape. It has appeared to them to contain the destruction of individual liberty and individual rights. . . . They do not sufficiently distinguish the State from the government. They see the danger to individual liberty of recognizing an unlimited power in the government, and they immediately conclude that the same danger exists if the sovereignty of the State be recognized. . . . The unlimited sovereignty of the State is not hostile to individual liberty, but is its source and support. Deprive the State, either wholly or in part, of the power to determine the elements and the scope of individual liberty, and the results must be that each individual will make such determination, wholly or in part, for himself: that the determinations of different individuals will come into conflict with each other, and that those individuals only who have power to help themselves will remain free, reducing the rest to personal subjection. . . . No State has made liberty so full and general as the modern national popular State. Now the modern national popular State is the most perfectly and undisputedly sovereign organization of the State which the world has yet attained."

Concerning the forms of the State Aristotle found three primitive forms, monarchy, aristocracy, and "polity." He uses democracy only in a bad sense, the three perversions of the State being with him tyranny, oligarchy, and democracy or ochlocracy. Others have added "the mixed State." (Concerning these forms see articles ARISTOCRACY; DEMOCRACY; MONARCHY; PLUTOCRACY; FEDERALISM; SOVEREIGNTY.)

STATE RIGHTS.—From 1789 to 1870 the question of State Rights, or the question of the rights of the respective States of the United States in reference to the Federal Government, was a burning question. (For a discussion of the history, see CENTRALIZATION, also CONSTITUTION.) In 1830 occurred the celebrated debate between Mr. Webster and Mr. Hayne upon this question, and South Carolina claimed the right of Nullification. This led eventually to secession and the war of 1861-65, which settled the doctrine, in most respects at least, against the believers in State sovereignty if not in State Rights.

Says Mr. James Bryce (*American Commonwealth*, first edition, chap. xxxvi.):

What, then, do the rights of a State now include? Every right or power of a government, except:

The right of secession (not abrogated in terms, but admitted since the war to be no longer claimable. It is expressly negated in the recent constitutions of several Southern States).

Powers which the Constitution withholds from the States (including that of intercourse with foreign governments).

Powers which the Constitution expressly confers on the Federal Government.

STATE SOCIALISM. See SOCIALISM.

STATISTICS.—Definition: Moreau de Jounés tersely defines statistics as the "science of social facts, numerically expressed." But since statistics are far from including all social facts, and in our day include many other groups of phenomena—*e. g.*, natural phenom-

ena in meteorology—the definition cannot make any claim to exactness. As it contains, however, the essential elements of a correct definition, it needs only to be transposed. We should define statistics to be the "numerical expression of facts, mainly social."

From crude beginnings statistics has developed step by step, as our knowledge of the facts to which it is commonly applied has grown more profound, and as the need for exact expression has been more generally felt. Without preserving any accurate records, history frequently alludes to census operations and the like in Egypt, Judea, Greece, and Rome. When Joseph went up to Bethlehem to be taxed in the reign of Augustus, he also went up to be counted.

The stormy Middle Ages were ruled by the sword rather than the law. But they have preserved some monuments, which show us statistical records even under such government as then existed. Of these the most notable is the *Doomsday Book* of the Conqueror, a wonderfully detailed land register of the regions which he had brought under his sway. But it is especially with the growth of the modern State that statistical records multiplied. The seats of government became vast depositories of records, containing precious information of home and foreign affairs.

Though in the main secret, it was unavoidable that such information should gradually come to be made public. It was natural that scholars, and especially officials with access to archives, should conceive the idea of

putting this information into systematic forms. The earliest precursor of the modern *Statesman's Year-Book* was the *Cosmographia* of Sebastian Muenster, 1536-44. It is a description of the world as then known. Geographical, political, legal, and economic information is curiously blended. He found many imitators in various languages. A characteristic work of this class is that of Thomas Salmon, *The Present State of All Nations*, 1724.

With the introduction of the subject into the universities came the effort at greater systematization. Gottfried Achenwall, professor at Göttingen, called this collection of facts statistics, and aimed at a treatment of the facts concerning each State according to a uniform plan. The word statistics is derived from the phrase of the former Latin lecturer's *res statisticae*—the things of the State. Everything which pertained to the State in its broadest acceptation—whether legal, political, administrative, or economic—was held to be the proper subject of statistics.

It will be seen, moreover, that such a body of information could have coherence only so long as there were no claimants with a better title to the various component parts. Very early in the present century, however, constitutional law, historical jurisprudence, and geography, successively claimed their own. There was nothing left to the statisticians but an ill-assorted residuum, into which no life could be breathed, and statistics in the old sense broke down.

In the meantime, a distinct branch of statistical learning had been developed. This branch was vital statistics.

In early times the Church kept scanty registers of baptisms, marriages, and burials. With the reorganization following the Reformation, the matter received the attention of the authorities, and careful registration was required. These registers had been introduced into London before 1600, and abstracts were published weekly. John Graunt appears to be the first to have made a careful study of the figures.

The mathematician Edmund Halley, in 1693, prepared a life-table in which, from a series of observations in Dresden, he shows what proportion of persons born in a given year will die or survive in each succeeding year. However defective in the details of its working out, Halley had grasped a general principle which had in it great possibilities. Its application to life insurance and to annuities is obvious, and later mathematicians and practical men devoted themselves with energy and success to a more scientific expression of the principle.

Before the beginning of the present century regularly organized official investigations were rare. In Sweden and Neufchatel census enumerations had taken place before 1750, but methods were crude and results only summary.

History.

Beginnings.

Modern Statistics.

Political necessity prescribed the census in the United States Constitution, and presided over the first enumeration in 1791. It is characteristic that one of the first acts of the new era in France was to commission Lavoisier to collect, so far as possible, all the information necessary to prepare reforms in finance and administration. We cannot trace here the successive steps by which the field of official investigation was enlarged; suffice it to say that in all countries statistical bureaux were established, and the statistical functions of the ordinary administrative bureaux greatly increased.

In the early part of the century the efforts of statisticians were exhausted in the elaborate preparation and execution of the various statistical problems which presented themselves to the governments. The result was a great furtherance of statistical method, which found its best expression in the work of the international statistical congresses.

Eight sessions took place between 1853 and 1876, composed of representatives of the statistical offices of Europe and the United States.

In 1887 the time seemed ripe for a new international organ, and the International Institute of Statistics was formed. Unlike the congresses, it has no official character, and the limitation of membership secures the professional character of the organization.

We have seen how the old grouping of facts about the State had to give way. The next grouping was about society. In 1835 Quetelet (1796-1874) published his work *Sur l'Homme*, which he designated as an attempt at social physics. The work had a great vogue, tho the apparent naked determinism of its conclusions brought out a host of adversaries. If crime was the result of social institutions, the whole doctrine of free will seemed badly shaken. Hence the philosophers were the first to make reply. Somewhat later the statistical evidence was more largely adduced. It was shown that the regularity was by no means so constant as to permit the predicate of law, but simply to point out the essential constancy of motives and conditions, while the actual variations, as in rates of suicide, were the most conclusive evidence of the freedom of choice.

In recent years the attempt to group all the facts of statistical experience under a common designation has been abandoned, and the effort made to systematize and analyze the processes of statistical thought. Thus has been established the methodological science of statistics, equally applicable in practise to all branches of statistical investigation. Perhaps the most prominent exponent of this doctrine is Meitzen.

Statistical Processes.—The first step in statistics is enumeration. A carefully defined unit must be accurately counted in a prescribed field of investigation. This primary step is simple, but oftentimes very troublesome, and not possible unless backed by governmental authority. If it be an enumeration of the people that is to be undertaken, it must be distinctly understood what characteristics are to be counted, care must be exercised that there are no omissions or duplications, and the area within which each enumerator is to act must be clearly defined. Those who use statistics are forced to assume the correctness of the original data. The perfection of methods is the task of the official statistician.

The results of any enumeration in the first instance mean nothing. They acquire significance only by comparison. This is the second process of statistical thought. The rules of such a comparison, while simple in appearance, are not so easy of application. They are that the unit counted should be the same, and the groups in their essential attributes analogous. Let us, for example, attempt to compare the criminality of the United States and of England. Whatever test we take—prisoners or convictions in relation to population—the attempt is fraught with difficulty. English law is not our law; it may know offenses that are here unknown,

and *vice versa*. Again, the groups themselves may be distinct, tho apparently analogous. Thus, supposing the laws to be approximately uniform and equally enforced, a comparison of the amount of crime in Illinois and Nevada might be defective. The latter is essentially a mining camp, with a preponderance of male adults. It cannot properly be compared with a State population in a well-settled country.

The comparisons which have been made are, in the main, descriptive only. They tell us that within a certain group there are a certain number of a particular unit. This descriptive knowledge is often as far as the statistical method will go, but in some cases further conclusions may be reached.

By collecting together a great many comparisons of a similar kind, we observe a certain constancy in the phenomena. This statistical regularity we consider normal. Gradually we extend this conception to fields not hitherto explored, so that when the results of the first inquiry are reached they are commonly accepted as characteristic until proved otherwise. In all phenomena we expect this regularity of occurrence. We do this in accordance with the law of probability, which teaches us that like causes and conditions, even if unknown and undetermined, produce like effects. If we see any deviation from the usual results, we are instantly led to a supposition of changed causes or conditions. By analyzing the supposed causes and finding which one shows fluctuations in quantity directly or inversely in proportion to the quantitative changes of the result, we may infer that a causal connection exists between the two facts. Through a series of observations we may arrive at a very clear understanding of the causes of phenomena.

Every statistical process is, as we have seen, an elaborate system of weighing and comparing numerical relations. The limits which are placed upon it are the difficulty of its primary operations and the restricted mass of accumulated experience with which comparisons can be made. There is a constant effort to overstep the limits which have been set for statistical effort by these two factors. Hence a study of these limitations will serve to illustrate what has already been said, and place us on our guard against error.

The theoretical requirement that all the units be counted is probably seldom absolutely fulfilled. It is, however, of prime importance, and should always be approximated. Otherwise comparisons certainly become faulty. This is especially true when we wish to compare the aggregates of two distinct groups, as population with area. Hence we must deal cautiously with all comparisons of this class. Oftentimes the object cannot be counted directly, and some symptomatic feature must be taken. In earlier days insanity in a family was secreted, and hospitals for the insane were not numerous. It is probable that statistics of insanity at that date are defective, and a comparison with the population gives a ratio of insanity which falls short of the truth.

Limits of Statistics.

On the other hand the law of regularity teaches us that for all inquiries the absolute number of the phenomena is not necessary. That rule teaches us that what is true of the whole is true of the part, other things being equal. Experience must teach us how far we shall apply the rule. The converse of the rule is the law of large numbers, which simply means that the larger the number of observations the more accidental conditions tend to neutralize each other. Hence we may in a large group study conditions prevailing in the group, though we cannot compare it with another class of phenomena. Such groups may be said to furnish material for the quantitative study of a phenomenon rather than a quantitative estimate of its aggregate importance.

What has been said about the necessity of counting all the units applies with equal force to the delimitation of the field. There are some cases where it is essential, others where it is not absolutely necessary.

In comparison the analogy of the groups is essential. This is based upon general characteristics. If the groups are apparently analogous, though not actually so in conditions essential to the problem in hand, the comparison is vitiated. An illustration will best show the force of the statement. The number of prisoners in the United States of foreign birth is commonly compared with the population of foreign birth, native-born prisoners with native-born population. This overlooks the fact that the population of foreign birth consists mainly of adults, while the native-born population is composed to the extent of nearly one-half of minors. Compare prisoners, therefore, with adult population in both cases, and the result will be quite different from that usually cited.

A keen search should always be made for a strict analogy in the groups compared. If it cannot be found—if, for instance, in the example cited no facts as to age were known—we can only vaguely estimate the effect of such divergencies. The comparison would be made, but we should not know how much of the deviation of the result was ascribable to faulty analogy, how much to other causes. Thus we may compare the births in a country district with the entire population, those of a city with its population. If by any cause there is in the one population a greater proportion of women in the child-bearing age, this may of itself explain the different results without resort to other explanations.

The judgment of causality is much more complex than that of quantity. There is so much more chance of error in the preliminary processes, in defective enumeration, misplaced comparisons, that all judgments of causality must be most carefully scrutinized. It is characteristic of our thought that we instinctively generalize, often from a very narrow basis of observation.

Validity.

In statistics every judgment is in the first instance limited to a very narrow range of phenomena. Hence the observed conditions cannot be taken as "laws" of society, for in statistical matters our experience is brief. What we discover applies in

the main to the nineteenth century. We cannot tell how it was before that time, or what may come after. The constancy of statistical observations requires the constancy of conditions under which the phenomena arose. But change is the very essence of history.

As conditions vary in the course of time in a given area, they also differ locally. Our observations in statistical matters hardly extend beyond the limits of the nations of occidental civilization. Among them there are the most diverse conditions of political, social, and economic life.

It is no wonder, then, that statistics should have fallen sometimes into hands incapable of using so delicate an instrument. With them it has been made to give the most absurd pictures of actual life, like a magic lantern with a defective lens. Hence it is not strange that objection is often made to the untrustworthiness of statistics.

Drink is said to be the main cause of crime because such a large percentage of prisoners admit that they use liquors. The fact is correct, but we should at least examine whether the use of liquors and crime were not two manifestations of a common cause, instead of being themselves in a causal relation. Most of the inmates of prison claim to have a religion; therefore religion does not prevent crime. Not absolutely indeed. It did not in the case of these men, but it may have done so in hosts of cases, and may be a powerful aid to social order.

These illustrations have been used not to take sides on any of the positions presented, either for or against. They show the possibility of error from premises some of which are statistical, but no one would claim that they were statistical errors.

It is the aim of statistical science to clear up any mystery that may attach to their use and thus render them an effective means of inquiry wherever the conditions of a statistical problem are found.

ROLAND P. FALKNER.

STEAD, WILLIAM T., was born at Embleton, Northumberland, in 1849, the son of a Congregational minister. Educated at home and at Wakefield, he left school at the age of 14, and served as an office boy in mercantile offices. In 1871 he became editor of the *North-ern Echo*, a Darlington daily. In 1880 he became assistant editor to Mr. J. Morley on the *Pall Mall Gazette*, and in 1883 took control of the paper, introducing in England what Matthew Arnold calls the new journalism. In 1885 he published *The Maiden Tribute of Modern Babylon*, an exposure of immorality in London society, and leading to the Criminal Law Amendment Act of the same year. In 1886 he visited Ireland and published his *No Reduction, No Rent*. In 1888 he went to Russia and wrote *The Truth About Russia*. In 1889 he went to Rome and wrote concerning the Vatican in 1890. In 1890, leaving the *Pall*

Mall Gazette, he established the *Review of Reviews*, and in 1893 he established *Borderland*, devoted to psychical phenomena. He has also interested himself in the Civic Church (*q. v.*). In 1893 he visited the World's Fair at Chicago and wrote *If Christ Came to Chicago*.

STEEL. See IRON AND STEEL INDUSTRIES.

STEIN, HEINRICH FRIEDRICH KARL, BARON VON, was born in Nassau, Germany, in 1757. Studying at Göttingen, from 1773 to 1777, in 1780 he entered the service of Prussia as an official in the mining department. Rising in office, he was made in 1804 Minister of State. He abolished serfdom and internal custom duties in Prussia, and introduced other reforms which largely paved the way to German unity. Frederick William III. dismissed him in 1807 on account of his criticism of the royal policy, but was obliged to recall him to office six months later, till Napoleon compelled the king to finally dismiss him. In Russia and in Germany, however, Stein worked against Napoleon, and after Napoleon's downfall Stein became president of a central commission to administer the lands occupied by the allied armies. After this he refused an office and lived in retirement in Frankfort and Westphalia till his death in Westphalia in 1831.

STEIN, LORENZ VON, was born at Eckernförde in 1815. Raised in orphanage, he was enabled by Frederick VI. to study at Kiel and Jena. Traveling in France, he met in Paris Cabet, Louis Blanc, Reybaud, and other Fourierist socialists, and published in 1844 *Der Sozialismus und Kommunismus des heutigen Frankreich*. In 1846 he became professor at Kiel, and published various books, among others his *System der Staatwissenschaft* (1852). In 1852 he lost his position, but in 1855 became professor of political economy at Vienna. Here he published, among other writings, *Lehrbuch der Volkswirtschaft* (1858), *Lehrbuch der Finanzwissenschaft* (1860), and above all his great *Die Verwaltungslehre* (7 vols., 1865), long an authority in administrative science. He died in Vienna in 1890.

STEPHENS, URIAH SMITH, was born near Cape May in New Jersey, in 1821. Of Quaker ancestry, he was educated for the Baptist ministry, but was compelled to learn a trade and became a tailor. He taught school and traveled extensively, but mainly followed his trade in Philadelphia, and in 1869 was the main founder of the Knights of Labor (*q. v.*). He was the first Master Workman of Assembly No. 1, and in 1878 was chosen the first Grand Master Workman. He died in 1882.

STEPNIAK, SERGIUS MICHAEL DROGOMANOFF, was born in the Ukraine mountains in 1841. He studied at Kieff, and became a teacher of history there, and professor in 1870, but was removed by the government in 1876, and driven into exile because of his strictures on Count Tolstoi. He had writ-

ten works, as early as 1862, which had been published, and he now went to Switzerland and wrote in the Little Russian dialect against absolutism and for democracy in Russia. In 1885 he removed to London. He became a leading authority on Russian subjects, and a steady worker for social and political reforms. He died in London, Dec. 23, 1895. Among his numerous works are *Underground Russia* and *The Career of a Nihilist*.

STEWART, IRA, was a working man of English birth, known as the father of the Eight-Hour Philosophy. With Mr. George E. McNeill and others he founded the Boston Eight-Hour League. Mr. Stewart's thoughts have been best developed by Mr. Gunton (*q. v.*) in his *Wealth and Progress*, tho in many ways Mr. Gunton's position is opposed to Mr. Stewart's. (See SHORT-HOUR MOVEMENT.)

STEWART, SIR JAMES DENHAM, was born in Edinburgh in 1712, the son of Sir James Stewart. Educated at the University of Edinburgh, he entered the law, but spent some time on the Continent and was so compromised by relations with the Pretender that from 1745 to 1763 he had to live on the Continent. In 1767 he published *An Inquiry into the Principles of Political Economy*, the best known of his many writings. (See POLITICAL ECONOMY.) He died in Lanarkshire in 1780. His complete works, political, metaphysical, and chronological, were collected by his son and published in 1806.

STIRNER, MAX, is the pseudonym under which a German, Kaspar Schmidt, wrote a book, in 1845, *Der Einzige und sein Eigentum* [*The Individual and his Property*], which most philosophical anarchists consider one of the ablest and earliest statements of their views. (See ANARCHISM.)

Schmidt was born in Beyreuth in 1806, he studied at Berlin, Erlangen, and Königsberg, first theology and then philosophy. He spent his life as a teacher, and yet even more as a student. He died at Berlin in 1856.

STÖCKER, ADOLF, was born in Halbersdadt, Germany, in 1835. He became army chaplain in Metz in 1871, and in 1877 Court Preacher at Berlin. In 1877, he was the main leader in establishing Protestant Christian Socialism in Germany. For an account of this see CHRISTIAN SOCIALISM, but it must be remembered that Christian Socialism on the Continent has not at all meant the radical movement it has usually meant in England and America. Especially under the lead of Stöcker it has meant little more than the religious wing of the paternal movement for the State and the Church to aid the poor. Stöcker has been even better known as a leader in the German anti-Semitic movement. In 1881 he was elected to the Reichstag. He has written *Christliche soziale Reden und Ausätze* (1890).

STOCK EXCHANGE.—The New York Stock Exchange was formed by 24 brokers in 1792. In 1817 the New York Stock and Exchange Board was constituted by 25 men. At present the membership is about 1100. Members are elected and must be nominated by two men who must say that they would accept the uncertified check of the nominee for \$20,000. The initiation fee is \$20,000. The dues are about \$50. Membership in the Exchange has sold as high as \$32,500. The London Stock Exchange was formed in 1802 with 557 members.

STOCK-WATERING may be defined as the increasing of the nominal capital of a corporation by the issue of new shares without a corresponding increase of actual capital. Against this practise much popular indignation has been raised. We shall, however, only quote an attempt to defend "innocent" stock-watering and a few careful and conservative estimates of the amount of stock-watering in certain typical industries. If cautious authorities take the following positions it will be seen that the popular statements have scarcely been put too strong. In the *Political Science Quarterly* for September, 1891, Mr. T. L. Greene distinguishes between "innocent" railroad stock-watering and what is not innocent. He argues that, in philippics against railroad stock-watering, it is usually forgotten how much railroads have to spend for improvements, besides their original investments; how far in all business there are natural profits besides those of interest on capital; how high dividends do not usually mean high charges, but often the reverse; how futile it is to attempt to limit success by legislation. He admits that there is a form of stock-watering which is not justifiable, and concludes that

"too much stress has been laid upon railroad stock-watering as a reason for compulsory reduction of charges; that the fact of such watering of railway capital is to be best explained as an attempt to adjust railway capitalization to the conditions common in other business undertakings; and that a distinction should be drawn in the public mind between stock-watering which is comparatively innocent in purpose and that which is not."

This is, however, no argument against the statements carefully made, as to the evil and extent of stock-watering. The latest of these as to railroads is C. B. Spahr's *Present Distribution of Wealth in the United States* (1896). The author says (pp. 40-42):

"Approximately one-half of the present railroad capitalization represents no investment whatever. . . . The writer follows the conservative estimates of *Poor's Manual*, 1884, and Van Oss's *American Railroads as Investments*" (New York, G. P. Putnam's Sons; London, Effingham & Wilson, 1893). For striking examples of our capitalization, see ex-Governor Larrabee's *The Railroad Question*, p. 186, and Hudson's *Railways and the Republic*, chap. vii.

"*Poor's Manual*, as is widely known, has put the original cost of the railroads at approximately the present bonded indebtedness. Mr. Van Oss, who is a defender of stock-watering on the ground that it prevents legislative reductions of rates, estimates that the bonds outstanding in 1890 cost the original investors not more than 67 cents on the dollar, and that the stocks cost these investors not more than 10 cents on the dollar. According to this approximation, the real investment contrasts with the nominal capitalization as follows:

	SECURITIES OUTSTANDING.	NOT HELD BY OTHER RAIL- ROADS AND SO DUPLI- CATED.	COST TO ORIGINAL INVESTORS.
Stocks.....	\$4,409,700,000	\$3,445,800,000	\$ 344,500,000
Bonds.....	4,123,900,000	3,680,900,000	2,466,200,000
Stocks and Bonds.....	\$8,533,600,000	\$7,126,700,000	\$2,810,700,000
Other Oblig- ations....	903,700,000	903,700,000
Total Capital- ization..	\$9,437,300,000
Total invest- ment.....	\$3,714,400,000

"The figures in the first two columns are from the report of the Inter-State Commerce Commission for 1890 on the "Statistics of Railways," pp. 46-48. Concerning stocks, Van Oss's statement is, verbatim, as follows:

"But, for \$4,650,000,000 shares now in existence, the original investor certainly paid not more than \$465,000,000, or 10 per cent. of their face value, and probably less. Hence shares now return at least 18 per cent. per annum on the actual investment" (p. 139).

"It should be observed, however, that the sum upon which the public is really paying interest is not the total capitalization of the railroads, nor even the stocks and bonds not held by other railroads, but rather the sum upon which 5 per cent. net is realized by the roads. This sum in 1890 was \$6,627,000,000. Not from the standpoint of socialism, but from the standpoint of common morality, which condemns as robbery both the refusal of the public to pay interest upon capital actually lent it, and the compelling of the public to pay interest on capital never lent it, the two thousand and odd millions of railroad capital representing no investment is simply capitalized extortion."

Perhaps, however, the worst cases of stock-watering are those of street railway companies.

"Tract No. 1," published by the Municipal League of Philadelphia, having on its Board of Management such men as Dr. Wayland, Mr. Stuart Wood, Professor James, shows for that city that when the Traction Company applied for privileges which, as it has proved, immediately added \$6,600,000 to the market value of its stock, the councils promptly granted its application, and then, in spite of the storm of public indignation, repassed the measure over the Mayor's veto by a majority of 25 to 10 in Select Council, and 77 to 31 in Common Council. "Tract No. 1" takes up the finances of ten leading street railway companies, exclusive of the Traction Company, and publishes their dividends for the last 10 years over against the capital actually invested in them. The table stands as follows:

Capital invested.....	\$5,840,000
Dividends for decade.....	15,164,000

Assuming that the city ought to have allowed these companies 10 per cent. yearly on their investment, there was a surplus profit of over \$9,000,000 which should have been turned into the public treasury. The effect of these abnormal profits upon the market value of the securities of these companies is set forth as follows:

Amount invested.....	\$5,840,000
Market price of securities.....	38,480,000

In other words, the public is paying interest upon over \$32,000,000 it never borrowed.

STONE, LUCY, was born in West Brookfield, Mass., in 1818. She taught school to earn money for a higher education, and in 1847 was graduated at Oberlin College. The same year she gave a lecture on Woman's Rights in her brother's pulpit at Gardener, Mass., and soon was engaged to lecture for the Anti-Slavery Society, in which work she had great success. In 1855 she married Henry B. Blackwell, but she always retained her own name.

In 1866 she helped to organize the American Equal Rights Association, and in 1869 the American Woman's Suffrage Association, of the executive board of which she was chairman for 20 years. She died in 1893.

STOWE, MRS. HARRIET BEECHER, was born in Litchfield, Conn., in 1812, daughter of Dr. Lyman Beecher and sister of Henry Ward Beecher (*q. v.*). She studied at home and in Hartford Female Seminary, where, too, she taught from 1827 to 1832. Her father becoming president of Lane Theological Seminary in Cincinnati, she moved there with him, and, in 1836, married there Professor C. E. Stowe. They lived there till 1850, when her husband became professor of theology in Bowdoin College, Me. In 1852, however, he accepted a professorship at Andover, Mass., which ill health compelled him to resign in 1862, Mr. and Mrs. Stowe going to reside in Hartford, Conn. Mrs. Stowe's book which made her reputation, *Uncle Tom's Cabin*, was written first as a serial for *The National Era* of Washington, and was based on incidents with which Mrs. Stowe became acquainted in her life in Cincinnati. March 20, 1852, it was published as a book, and 300,000 copies were sold in a year; 40 editions appeared during the year. It has been translated into nearly 20 languages, and probably contributed more than any other one effort to rousing the country against slavery. In 1853 Mrs. Stowe visited Europe and wrote *Sunny Memories of Foreign Lands*. In 1856 she wrote *Dred*, another slave story, only moderately successful. Among her other numerous tales are *Old Town Folks*, *My Wife and I*, *Men of Our Times*. Mrs. Stowe died in Hartford, July 2, 1896.

STREET RAILWAYS.—Cheap and rapid transit is one of the most important factors in city life. To it we must chiefly look for any immediate relief from the congestion of population in the slums and tenement districts of our great cities. If transit can be made so cheap and rapid that the working man can live in the country, the benefit to him and his children, and through them to society in general, will be incalculable. Engineering statistics of the cost of building and operating electric roads and the rate of their depreciation disclose the fact that from 10 to 15 cents per car mile will cover all expenses, including depreciation, taxes, and interest on actual investment. In Boston and other large cities the receipts average 35 cents a car-mile on a 5-cent fare, wherefore it is clear that a 3-cent fare would be sufficient. Were it not for watered stock, lobby funds, legislative cost, enormous salaries of leading officers, and other unnecessary or illegitimate expenses, the roads could be run still more cheaply; and if they were owned by the city clear of debt, and no interest or profit were required, it is probable that a populous city would reduce the fare to 2 cents, and still leave the roads self-sustaining. This is the more probable when we consider the enormous increase of traffic that invariably follows a decided lowering of rates, and the compan-

ion fact that the cost per passenger diminishes as the volume of business in a given area increases.

Aside from general engineering statistics which are more fully dealt with in the *Arena* for May, 1895) there are many specific facts which point to the same conclusion.

In Glasgow 30 per cent. of the fares are 1 cent, and the average of all fares is under 2 cents, yet the city's roads made a profit of \$111,000 in the first 11 months of municipal operation (July 1, 1894, to May 31, 1895). The cars are drawn by horses, a far more expensive power than electricity, and the city labored under serious disadvantages from the sickness of many horses, and a tremendous omnibus competition started by the old railway company.¹

In Budapest the fares are 2½ cents, and yet the roads made 90 per cent. profit on their investment in 1894.² The underground electric conduit system is used, and grooved rails set level with the surface of the street so as to offer no obstruction whatever to the wheels of wagons and carriages.

In Berlin the private street-car companies show 75 per cent. of the fares 2½ cents, an average fare of 3 cents on the whole traffic, and operating expenses about one-half of the receipts, or 1½ cents per passenger. This, too, is horse-car traffic, and the passengers are fewer than in Boston. The public elevated (*Stadtbahn*) roads of Berlin sell yearly tickets to go in and out 5 miles, as often as you please, for \$4.50 a year, a running average of about 10 miles for 1 cent.³

In Detroit a 3-cent fare is in force all over the city, Mayor Pingree having at last completely conquered the old company, which long declared a 3-cent rate an impossibility. It has now made even a 2½-cent rate on one of its lines, and the new company offers to run all the roads in Detroit on a uniform 2½-cent rate, with free transfers all over the city, and pay the interest on the purchase price of the tracks if the city will take them by eminent domain.

In Savannah, in 1895, a 1-cent rate was established, with the result of greatly enlarging the traffic and actually increasing the receipts. A very fair profit was made—the expenses being \$10 to \$13 a car and the receipts \$14 to \$18.⁴

In Toronto the roads are operated by a company that agrees to sell 25 tickets for \$1, or 6 for a quarter; workingmen's tickets, good night and morning, 8 for a quarter; and children's tickets from 8 A. M. to 5 P. M., 10 for a quarter. The company must pay the city \$800 a year for each mile of track; 8 per cent. on the gross receipts to \$1,000,000; 10 per cent. from \$1,000,000 to \$1,500,000; 12 per cent. from \$1,500,000 to \$2,000,000; 15 per cent. from \$2,000,000 to \$3,000,000; and 20 per cent. on all over \$3,000,000. The city engineer controls the roads as to the number of cars to be operated, the improvements to be introduced, etc. Their bookkeeping must be satisfactory to the city treasurer and auditors. At the end of 20 years (or 30, since the franchise may be "renewed for a term of 10 years and no longer")—at the end of the lease the city may take the plant at its actual value, as determined by arbitration.⁵

In the New York Annex recently a street railway franchise was sold for \$250,000 cash down, and a promise to pay 4½ per cent. of the gross earnings each year for the first 5 years, and 4¾ per cent. each year thereafter. As the company expects to make a good profit on a very expensive road, and are willing to give nearly half the receipts on a 5-cent fare, it is clear that they do not think the cost of operation will run above 2 cents at the most. The company is not to use the overhead trolley south of 162d street, though north of that line it is permitted for ten years. The company is to pave the streets and keep them clean and free from dirt and snow, and the cars are to be "properly and sufficiently heated during cold weather on pain of a penalty of \$10 per day for each car not so heated."

⁵ Agreement between the City of Toronto and Geo. W. Kielew, William McKenzie, H. A. Everett, et al. September 1, 1891, with the awards, conditions, etc., May 5, 1891.

It is thought by some that the ultimate ideal is to make the street cars *free* to all who wish to ride—just as free as the pavements, the parks, and the public schools. The saving of labor in printing tickets, collecting fares, keeping accounts, etc., would be considerable, and the plan would be a great boon to the poor. Such a status, however, will have to be approached gradually, and for a long time to come it would seem to be best to aim at a system that will reduce expenses to the lowest point consistent with the support of the roads by the collection of fares graded in the way above suggested.

Public ownership will promote *good* service as well as *cheap* service.

Strap passengers help profits, no doubt—the companies say that the people on the straps pay the dividends, the more people in a car the smaller the expense per passenger—but public ownership would think of accommodations more than dividends, and would therefore run more cars in winter.

Good Service.

Warming the cars is important for the health and comfort of patrons and employees.

Cushioned fenders, running close to the track, are also necessary to the safety of the public. In Budapest the cars have fenders that will push a baby from the track without injuring it. United States cities have some fender ordinances, but the companies have stubbornly refused to fulfil the spirit and purpose of the law, and in some cases resisted even the letter of it until fined for disobedience. Most of the fenders in use in our Eastern cities run 4 to 12 inches above the level of the road, and some have iron fronts that would break a man's leg like a splinter. No pains should be spared to provide an efficient fender for every car. The companies care nothing about it unless it will save them more money than it costs. Some years ago the street-car presidents of Philadelphia met to consider the adoption of a fender just invented. They asked how much it would cost. The inventor told them \$50 a car. The presidents figured a little and found it would be cheaper to pay damages for running over people; so they did not buy the fenders.

The overhead wires are objectionable in many ways. They are dangerous to life, and mar the looks of our streets. The underground trolley has proved entirely practicable and satisfactory in Washington and New York, and is preferable in every way to the overhead system, except that the original cost is greater. There is a *surface* system just coming into notice which requires no slot or groove in the street, and no overhead wire, and is said to be absolutely safe and cheaper in construction than even the overhead. It is to be hoped that it may displace the nets of wire that disfigure our streets.

The use of *grooved rails* is a matter well worth the attention of the public. In Liverpool, Budapest, and other European cities, the flange of the wheel runs in a narrow groove in a solid rail laid level with the surface of the street. A similar rail is used in Washington, D. C., and has been adopted in Detroit through the efforts of Mayor Pingree. It is also in New York on the Bowery line and the Broadway cable road. The latter, however, is not well laid, being sunk so far below the paving as to leave the street still very rough.

The *employees* of the roads would be better off in several respects under public ownership. Freedom of association, which is for the most part denied them by the private companies, would not be interfered with by the city. In a few cities the companies recognize the organizations of the workmen, but as a rule membership in any labor organization is a cause of discharge, and a man who is active in such organizations is in danger of being blacklisted throughout the country. Even the right of petition is not accorded by the companies generally; *i. e.*, men who get up

and present petitions are apt to be discharged upon the slightest pretext. Strikes are sometimes successful as in Detroit, but oftener end in disaster, as in Brooklyn and Philadelphia, where the men accomplished nothing but the loss of their positions. Wages are sometimes as low as 16 cents an hour, and 13 to 15 hours are not infrequently required to constitute a day's work. The motormen suffer much from the cold in winter, and are sadly in need of the protection afforded by vestibules. Ohio, Indiana, Michigan, Minnesota, and Wisconsin have statutes requiring the cars to be supplied with vestibules in cold weather. They are also in use in Pittsburg and Harrisburg, Pa.; Rochester and Buffalo, N. Y.; Lowell to Nashua, Mass., etc. They work well everywhere.

Employees.

The locomotive engineer, the steersman of a tug, the pilot of an ocean steamer are all protected against the weather—why should a motorman whiz through the icy air at the rate of 6 to 15 miles an hour, or more, and sometimes in the teeth of a 40-mile zephyr at zero or lower, with nothing in front of him to break the force of the wind? In Boston, 1896, a number of motormen froze their faces, not merely their fingers and toes and ears; those are so commonly bitten that no note is taken of them.

It is sometimes said that moisture and frost will gather on the glass, obscuring the vision and rendering accidents more likely. It is a baseless excuse. If the vestibule is warmed as it should be, no moisture or frosted breath will form on the inside. If it is partitioned off from the rest of the car, and the glass in front made double, there will be no such trouble, even tho it is not warmed. Even under the most unfavorable circumstances there will be no accumulation on the inside that cannot be easily and quickly removed and the glass kept clear. As for the outside there is no obscurement, except in a storm. Sometimes sticky snow gathers on the glass and dulls the vision. Then the engineer opens the windows and wipes off the snow. The motorman could do the same. The rain as a rule does not materially interfere with the sight—when it does, the motorman could open the windows a few inches so as to make a four- or five inch band of open space from left to right on the level of the eye. This is the way the pilots do. The motorman could do the same if the windows were properly made, and if the vestibule were tightly built but very little air would come through the opening. Mr. Reeves Stewart, who runs a vestibuled trolley on the Pennsylvania railroad, and spent eight years on a locomotive before he took the trolley, says there is never any trouble with frost or moisture inside, nor any difficulty in seeing through the glass in a rain, and that it is easy to wipe off the snow when it sticks. The pilots on the Fall River line say it is very seldom that they cannot see as clearly through the glass as through the open. When it rains or snows the air is never so cold as to make a man suffer even with the windows wide open, and when it does not storm the windows could always be closed without any danger to clear vision in a properly constructed vestibule. The vestibule should be so built that the motorman can have the space in front of him wholly open, or partly open, or wholly closed as he thinks best. This, with the employment of reasonably sensible and efficient men, will make the matter safe and right.

A bill is pending in Congress to compel the Washington roads to vestibule the cars, and another to reduce the hours of labor for street-car employees to eight.

When municipal ownership is proposed, the corporationists declare that it is not to be thought of because it will lead to *political corruption* and abuse of power for party pur-

poses. The truth is that the corporations are the chief cause of political corruption. Mayor Pingree says that the Citizens' Street Railway Company of Detroit "literally owned the council body and soul" (*Facts and Opinions*, by Hazen S. Pingree, p. 31). They would pay \$3000 for a member (*Id.*, p. 30). They even made an actual offer of \$75,000 to buy the mayor himself (*Id.*, pp. 86-122). The mayor says, "My experience in fighting monopolistic corporations, and endeavoring to save the people some of their rights as against their greed, has convinced me that the corporations are responsible for nearly all the thieving and hoodling with which our cities suffer" (p. 24).

Under private management, street railway corporations corrupt our politics, spoil the safety and looks of our streets, charge exorbitant rates, crowd the cars, freeze passengers and motormen, work their men long hours, deny them the right of organization, render indifferent service, water their stock, dodge the tax laws, put rascals in office, and run our cities to suit themselves.

A summary of the situation would read something like this:

THE PEOPLE WANT.	THE CORPORATIONS WANT.
1. Low fares.	1. High fares.
2. Good service.	2. Small expenses.
3. Seats for all.	3. Passengers on the straps, in the aisles, and on the platforms.
4. Efficient fenders.	4. No expense for cushioned fenders; it is cheaper to pay damages than to buy good fenders.
5. Cars well warmed in winter.	5. Little or no expense for heating; it is cheaper to freeze the passengers.
6. Grooved rails, laid so as to leave the streets smooth.	6. The cheapest rails, whatever effect they may have on the street.
7. A system safe and convenient.	7. The dangerous, ugly, street-marring, overhead trolley system.
8. Reasonable profits on actual investment.	8. Big dividends on watered stock.
9. Honest book-keeping.	9. Doctored accounts.
10. Just assessments and equal taxation.	10. Shrunk assessments and escape from taxation.
11. Honest and impartial government in the interests of all.	11. Corrupt government in the interest of corporations.
12. Good wages and reasonable hours for all employees.	12. Long hours and short wages for the men,—short hours and big wages for the managers.
13. Full freedom of organization.	13. No union men.
14. Vestibules for the motormen.	14. No expense for vestibules,—men are cheaper than glass and wood; if a man freezes now and then it is easy to buy another.
15. Arbitration of difficulties.	15. Their own imperial way with "nothing to arbitrate."

In short, the people ask for justice, kindness, fair play, and the public good.

In short, the corporations aim at fortunes for industrial aristocrats.

in 1831. The first successful electric street railway was at Leichterfelde near Berlin in 1881. San Francisco had a cable road in 1873.

According to the Eleventh Census there were in the United States in 1890, 5783 miles of street railways. There were 32,505 cars, with 70,764 employees, and they carried 2,023,010,202 passengers. New York according to the census report had, in 1890, 12 miles for each 1000 inhabitants. Chicago 18, Brooklyn 21, Philadelphia and St. Louis 26 each, Boston and suburbs 41, London 3, Liverpool 5, Birmingham 7, Berlin 8, Dresden 11, Hamburg 13, Paris 5, Vienna 5, Budapest 7, Brussels 7.

New York had 297 rides per inhabitant, Boston and suburbs 225, Brooklyn 183, Chicago 164, Philadelphia 158, St. Louis 150, London 31, Liverpool 51, Glasgow 61, Berlin 87, Hamburg 78, Dresden 42, Vienna 43, Budapest 37.

According to the *Street Railway* in 1896 there were in the United States 1210 miles of horse railways, 12,133 of electric, 599 of cable, and 510 of miscellaneous roads. There were 48,182 cars. The total capitalization was \$95,000 per mile. In the New England States the capitalization was \$54,500 per mile; in the Middle States \$147,300, Central \$86,600, Southern \$48,000, Western \$61,000. In Massachusetts \$852,500, Rhode Island \$119,100, New York \$182,800, Pennsylvania \$130,500, District of Columbia \$137,600, Michigan \$36,400, Illinois \$134,500, California \$78,600; varying mainly according not to cost but to watering of stock.

FRANK PARSONS.

STRIKES.—A strike occurs when the employees of an establishment refuse to work unless the management complies with some demand. A lockout occurs when the management refuses to allow the employees to work unless they will work under some condition dictated by the management. In effect strikes and lockouts are practically the same thing; the disturbances simply originating with one side or the other in the case. A strike, however, is often really a lockout, because it not unfrequently happens that employers, finding a dull market and not wishing to bear the opprobrium of discharging their employees or suspending work, require some grievous condition which causes the employees to strike. The real origin of strikes is, therefore, by no means always easily determined. Twice the United States Commissioner of Labor has reported on the subject of strikes, and from these reports the following statistics are taken. The Third Annual Report (1887) reported on strikes in the United States down to December 31, 1886. It found records of 1491 strikes down to 1881, of which 813 took place in 1880; 199 took place from 1875 to 1879, and 185 from 1870 to 1874; 4 took place in the eighteenth century, the first being a strike among the bakers of New York city in 1741; 75 took place between 1800 and 1850. Of the 1491 strikes, 1089 related to wages; 316 succeeded, 154 were compromised, 583 failed, and 478 had their issue unknown. Between 1881 and 1886, inclusive, there were 3902 strikes in 22,304 establishments, involving 1,332,203 employees. Of these the corresponding figures for 1886 alone were 1411, 9861, and 499,489. Of the whole number, 46.52 per cent. succeeded, 13.47 per cent. partly succeeded, and 37.95 per cent. failed. The strikes were for higher wages in 42.32 per cent. of the establishments, for shorter hours in 19.48 per cent., against reduction in wages in

Statistics.—The first street railway was made by John Stephenson in New York

7.77 per cent. The loss to employees by strikes is placed at \$51,814,723 for strikes and \$3,157,717 for lockouts. The employers' loss is put at \$30,701,553 for strikes and \$3,462,261 for lockouts. The Report of 1895 investigates from 1887 to May 31, 1894, inclusive. There were 14,389 strikes in 69,166 establishments, involving 3,714,231 employees. From January 1, 1881, to January 30, 1894, 44.49 per cent. of the strikes succeeded, 11.25 per cent. partly succeeded, and 44.23 per cent. failed. Of the lockouts, 40.37 per cent. succeeded, 9.58 per cent. partly succeeded, and 47.75 per cent. failed. Of the strikes for the whole period, those in 42.32 per cent. of the establishments were for higher wages, 19.48 per cent. for shorter hours, and 7.77 per cent. against lowered wages. The loss to employers for the whole period is put at \$82,589,786, for employees, \$163,807,657; or \$3.77 per striking employee per year.

The most important strikes in the United States have been the railroad strikes of 1877, on the Gould system in 1885 and 1886, the Homestead strike of 1892, and the great Pullman strike of 1894. (For an account of the last two, see HOMESTEAD and PULLMAN.) The railroad strike of 1877, the first of the great strikes, and which first called general attention to the labor movement in America, began July 15 on the Baltimore and Ohio Railroad at Martinsburg, W. Va., and was caused by a 10 per cent. reduction in wages already low. July 19, a still larger strike broke out at Pittsburg on the Pennsylvania Railroad; the grievance being the introduction of the "double-headers," or freight trains of 84 cars with two engines, enabling the company to do with one-half their freight service. There was rioting, with loss of life at various places. The State militia at Martinsburg and Pittsburg refused to fire on the strikers, and United States troops were called out. In Cincinnati, Toledo, and St. Louis mobs of roughs and tramps succeeded in closing shops, mills, etc. The main trouble, however, was at Pittsburg, where the crowds resisted the troops; 22 persons were killed by soldiers in one day. Gatling guns were used, and finally order was restored. One thousand six hundred cars (mainly freight) and 126 locomotives were burned. The loss at Pittsburg was estimated at \$5,000,000.

The first great strike on the Gould system took place at Sedalia, Mo., in March, 1885, for a restoration of wages which had been reduced. It was very general, but did not last long, when the company gave in. The next year, however, a strike began at Marshall, Tex., growing out of the discharge of a foreman prominent in the Knights of Labor. It became general, and during all March traffic was suspended on the system, tho relatively not much damage was done. This strike was lost.

Other great American strikes have been those of the telegraphers in 1883; on the Lehigh Valley Road in 1893; at Buffalo, N. Y., in 1892; in the mines of Tennessee in 1891; at Brooklyn in 1895; on the Great Northern Railroad in April, 1894, where Mr. Debs

won his first fame by organizing and winning the strike.

(In Great Britain, for some notice of earlier strikes, see TRADE-UNIONS.) The two recent strikes in Great Britain have been the great dock strike (*q. v.*) of 1889 and the strikes of the miners in 1893.

According to a report of the Labor Department of the Board of Trade, the following are the statistics of strikes and lockouts in Great Britain and Ireland:

YEAR.	Disputes.	Persons Affected.	Successful.	Partly Successful.	Unsuccessful.	Not Known.
1888.....	517	119,273	48.1	18.2	24.0	9.7
1889.....	1211	359,897	43.0	31.8	17.0	7.9
1890.....	1040	393,245	37.1	22.2	31.6	9.1
1891.....	906	267,460	41.1	20.1	30.0	8.8
1892.....	700	356,799	41.0	17.0	32.7	9.3
1893.....	643	570,060	35.6	17.1	28.9	18.4
1894.....	926	306,000	17.4	14.3	51.8	16.5

In France the principal strikes have been also among the miners. According to the French *Office du Travail* there were, in 1893, 634 strikes, affecting 170,123 men. In 1894 there were 391 strikes, affecting 54,576 men; 45½ per cent. of these strikes failed, 21 per cent. were completely won, and the rest were unknown or compromised.

(For other countries, see those countries. Concerning the involved questions of the ethics of strikes, see TRADE-UNIONS.)

Says Professor W. J. Ashley of Harvard University (*The Railroad Strike* of 1894, p. 8):

"It is the opinion of almost every economist of repute, of whatever school, that labor combinations, with a power to appeal in the last resort to the joint refusal to work, *i. e.*, to strike, are, under the present system of competition, the indispensable means of enabling the sellers of labor to take care of their own interests" (J. S. Mill, *Principles of Political Economy*, bk. v. chap. x. § 5, second half). With these words of Mill may be compared the language of Fawcett (*Manual*, sixth ed., p. 242), Walker (*Political Economy*, § 468), and Marshall (*Elements of Economics*, 1892, pp. 381, 382, 390). These are not writers particularly sympathetic toward trade-union policy, or particularly hopeful of good results from such action. They merely state that, even tho in very many cases strikes may have been unwise, the right to strike is, in itself, a necessary safeguard of working men's interests."

Trade-unionists do not as a rule believe in strikes. They are often compelled, however, to strike because, when other measures have failed, it is their only way to protest against and to resist reductions in wages, unfair treatment, or refusals of firms to grant increase of wages when the market allows. When *trade-unions are weak or just organizing*, their members sometimes rush into foolish strikes. Strong trade-unions do not strike until careful investigation has been made, until the national executive committee of their trade, as well as the local union, approves, and until they have money in the bank to make a hard fight.

Strong trade-unionism means the lessening of strikes. (See TRADE-UNIONS.)

Concerning the treatment of strikes and the evil to the public, see articles ARBITRATION and CONCILIATION, also PULLMAN STRIKE.

SUBSIDIES is the term usually given today to grants of money by governments to private enterprises. Originally it was used in English history for special taxes assessed on property, and in European history for payment by governments to their allies.

The most important modern subsidies have been to railways and steamship companies.

England has granted no railway subsidies except in Ireland. France defrayed about half the original cost of her railways, and this system has been largely followed in Austria, Russia, Southern Europe, and British India. In the United States railway subsidies, in the form of land grants mainly, have been very extensive (see RAILWAYS); 200,000,000 acres have been given, the only about one-quarter of this has been patented.

In steamship subsidies Great Britain has done much more. In 1840 the Cunard company received an annual subsidy of \$400,000, and this was not reduced till 1870. At one time England spent nearly \$5,000,000 annually for the conveyance of mails. The admiralty subsidies of Great Britain to-day are about \$165,000 annually, besides \$3,500,000 for sea postage, which is about \$2,250,000 more than the receipts for sea postage. Great Britain pays this partly for military purposes, and can use subsidized ships in time of war. The United States has done much less. In 1845 the Collins line and Pacific Mail Steamship Company received subsidies. In 1852 the United States paid about \$2,000,000 for foreign mail service. On account of accidents and the war American lines to Europe and the Collins line disappeared. The Pacific Mail Steamship Company became corrupt, and in 1875 the subsidy was not renewed. In 1832 the (American) International Navigation Company received a subsidy for carrying mails to Europe. (See PLUTOCRACY, for legislative favors to this line.) In the year 1893-94, the United States paid \$711,444 for mail service by United States vessels, and \$461,057 for foreign vessels.

Germany, France, and most European countries grant considerable subsidies.

(See also BOUNTIES.)

SUB-TREASURY PLAN.—This is a plan which is an outgrowth of the Farmers' Alliance movement, and became prominent after its indorsement by the Farmers' Alliance (*g. v.*), at their meeting at St. Louis, 1889. The following is the text of the bill, drafted to embody the plan.

SECTION 1. Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that there may be established in each of the counties of each of the States of this United States a branch of the treasury department of the United States, to be known and designated as a sub-treasury, as hereinafter provided, when 100 or more citizens of any county in any State shall petition the Secretary of the Treasury requesting the location of a sub-treasury in such county, and shall,

1. Present written evidence, duly authenticated by oath or affirmation of county clerk and sheriff, showing that the average gross amount per annum of cotton, wheat, oats, corn, and tobacco produced and sold in that county for the last preceding two years exceeds the sum of \$500,000, at current prices in said county at that time, and,

2. Present a good and sufficient bond for title to a suitable and adequate amount of land to be donated to the Government of the United States for the location of the sub-treasury buildings, and,

3. A certificate of election showing that the site for the location of such sub-treasury has been chosen by a popular vote of the citizens of that county, and also naming the manager of the sub-treasury elected at said election for the purpose of taking charge of such sub-treasury under such regulations as may be pre-

scribed. It shall in that case be the duty of the Secretary of the Treasury to proceed without delay to establish a sub-treasury department in such county as hereinafter provided.

SEC. 2. That any owner of cotton, wheat, corn, oats, or tobacco may deposit the same in the sub-treasury nearest the point of its production, and receive therefor treasury notes, hereinafter provided for, equal at the date of deposit to 80 per cent. of the net value of such products at the market price, said price to be determined by the Secretary of the Treasury under rules and regulations prescribed, based upon the price current in the leading cotton, tobacco, or grain markets of the United States; but no deposit consisting in whole or in part of cotton, tobacco, or grain imported into this country shall be received under the provisions of this act.

SEC. 3. That the Secretary of the Treasury shall cause to be prepared treasury notes in such amounts as may be required for the purpose of the above section, and in such form and denominations as he may prescribe, provided that no note shall be of a denomination of less than one dollar or more than one thousand dollars.

SEC. 4. That the treasury notes issued under this act shall be receivable for customs, and shall be a full legal tender for all debts, both public and private, and such notes, when held by any national banking association, shall be counted as part of its lawful reserve.

SEC. 5. It shall be the duty of the manager of a sub-treasury when cotton, grain, or tobacco is received by him on deposit, as above provided, to give a warehouse receipt showing the amount and grade or quality of such cotton, tobacco, or grain, and its value at date of deposit; the amount of treasury notes the sub-treasury has advanced on the product; that the interest on the money so advanced is at the rate of 1 per cent. per annum, expressly stating the amount of insurance, weighing, classing, warehousing, and other charges that will run against such deposit of cotton, grain, or tobacco. All such warehouse receipts shall be negotiable by indorsement.

SEC. 6. That the cotton, grain, or tobacco deposited in the sub-treasury under the provisions of this act may be redeemed by the holder of the warehouse receipt herein provided for, either at the sub-treasury in which the product is deposited, or at any other sub-treasury, by the surrender of such warehouse receipt, and the payment in lawful money of the United States of the same amount originally advanced by the sub-treasury against the product, and such further amount as may be necessary to discharge all interest that may have accrued against the advance of money made on the deposit of produce, and all insurance, warehouse, and other charges that attach to the product for warehousing and handling. All lawful money received at the sub-treasury as a return of the actual amount of money advanced by the government against farm products as above specified shall be returned, with a full report of the transaction, to the Secretary of the Treasury, who shall make record of the transaction, and cancel and destroy the money so returned. A sub-treasury that receives a warehouse receipt as above provided, together with the return of the proper amount of lawful money, and all charges as herein provided, when the product for which it is given is stored in some other sub-treasury, shall give an order on such other sub-treasury for the delivery of the cotton, grain, or tobacco, as the case may be, and the Secretary of the Treasury shall provide for the adjustment between sub-treasuries of all charges.

SEC. 7. The Secretary of the Treasury shall prescribe such rules and regulations as are necessary for governing the details of the management of the sub-treasuries, fixing the salary, bond, and responsibility of each of the managers of sub-treasuries (provided that the salary of any manager of a sub-treasury shall not exceed the sum of \$1,500 per annum), holding the managers of sub-treasuries personally responsible on their bonds for weights and classifications of all produce, providing for the rejection of unmerchantable grades of cotton, grain, or tobacco, or for such as may be in bad condition, and shall provide rules for the sale at public auction of all cotton, corn, oats, wheat, or tobacco that has been placed on deposit for a longer period than twelve months, after due notice published. The proceeds of the sale of such product shall be applied, first to the reimbursement of the sub-treasury of the amount originally advanced, together with all charges, and, second, the balance shall be held on deposit for the

benefit of the holder of the warehouse receipt, who shall be entitled to receive the same on the surrender of his warehouse receipt. The Secretary of the Treasury shall also provide rules for the duplication of any papers in case of loss or destruction.

SEC. 8. It shall be the duty of the Secretary of the Treasury, when Section 7 of this act shall have been complied with, to cause to be erected, according to the laws and customs governing the construction of government buildings, a suitable sub-treasury building, with such warehouse or elevator facilities as the character and amount of the products of that section may indicate as necessary. Such buildings shall be supplied with all modern conveniences for handling and safely storing and preserving the products likely to be deposited.

SEC. 9. That any gain arising from the charges for insurance, weighing, storing, classing, holding, shipping, interest, or other charges, after paying all expenses of conducting the sub-treasury, shall be accounted for and paid into the Treasury of the United States.

SEC. 10. The term of office of a manager of a sub-treasury shall be two years, and the regular election to fill such office shall be at the same time as the election for members of the House of Representatives of the Congress of the United States. In case of a vacancy in the office of manager of the sub-treasury by death, resignation, or otherwise, the Secretary of the Treasury shall have power to appoint a manager for the unexpired term.

SEC. 11. The sum of \$50,000,000, or so much thereof as may be found necessary to carry out the provisions of this act, is hereby appropriated out of any moneys in the Treasury not otherwise appropriated, for that purpose.

Professor Commons says of this plan in an article in *The Voice* (September 14, 1893):

"The so-called sub-treasury plan of the Farmers' Alliance is an interesting attempt to establish such a currency [an elastic one]. Farmers have but little use for cash during most of the year, but at harvest time they need a large amount of money to move their crops and pay their debts. This creates a new demand for money, which must then be shipped from the East and from Europe. This yearly demand for money often creates a stringency. Money becomes dearer. And just as there is a freight-car famine at that time of the year resulting in high freights, so there is a money famine resulting in dear money and low prices of products. The farmers claim that the prices of their products are crowded down to 40 per cent. below the prices of six months later; the difference, of course, going into the pockets of the speculators. The sub-treasury plan provides for depositing the staple products of the farmers in government warehouses, just as alcoholic liquors are to-day deposited, and the issuing of paper money to be loaned to the farmers on the security of the staple products. When the farmer redeems his warehouse deposit he returns the paper money, pays the charges, and the money itself is canceled and disappears from circulation. Thus we have a perfectly automatic and elastic currency, expanding when the demand expands and contracting when the demand contracts.

"There is a wide-spread disposition to ridicule this plan of the farmers as visionary and socialistic. Perhaps it is visionary and socialistic for a great free government, where everybody is supposed to be equal, but it is an important fact that the very same plan is in actual operation to-day in the benevolent despotism of Russia. The imperial bank advances paper money through the railroad companies acting as agents to farmers along the lines of the roads, on the security of crops deposited in railway warehouses. The farmers pay 6 per cent., are not permitted to maintain a loan longer than one year nor a larger amount than 60 per cent. of the market value of their grain deposit. This policy has been in operation for five years, and is said to have done more than anything else to encourage agriculture in that country, since it enables the farmer to get higher prices for his crops and frees him from the usury of the money-lenders."

The plan, however, is little advocated to-day even by the farmers. The agitation on the subject has turned into other channels. (See SILVER.)

SUEZ CANAL.—The Suez Canal was commenced in 1859 by M. de Lesseps, on a concession to a stock company by the Egyptian Government after the European powers had finally given consent. It is 100 miles long, 60 miles of which are through narrow lakes. It was opened in 1869. The cost, as originally completed, was \$95,000,000. In 1894, 3352 vessels passed through it, paying \$14,770,081 in tolls.

SUFFRAGE. See ELECTIONS; also WOMAN'S SUFFRAGE.

SUICIDE.—The statistics of suicide indicate its increase in the United States. Mr. F. L. Hoffman, writing in the *Arena*, vol. vii. pp. 680-695, gives the following figures based on official statistics:

RATIO OF DEATHS TO SUICIDES. AVERAGES FOR FIVE YEARS.

	1861 to 1865	1866 to 1870	1871 to 1875	1876 to 1880	1881 to 1885	1886 to 1890
Massachusetts....	329	301	260	232	218	226
Rhode Island.....	..	219	216	218	220	311
Connecticut.....	..	283	251	185	170	143
Michigan.....	282	242	215	207

The average annual suicide rate per 100,000 for various countries is given by Barber as follows:

Saxony, 37.1; Denmark, 25.8; Austria, 21.2; Switzerland, 20.2; France, 15.7; Germany, 14.3; Queensland, 13.5; Victoria, 11.5; New South Wales, 9.3; Bavaria, 9.1; New Zealand, 9.0; South Australia, 8.9; Sweden, 8.1; Norway, 7.5; Belgium, 6.9; England and Wales, 6.9; Scotland, 4.9; Italy, 3.7; United States, 3.5; Russia, 2.9; Ireland, 1.7; Spain, 1.4. In Dresden, 51; Paris, 42; Berlin, 36; Vienna, 28; Stockholm, 27; Christiania, 25; London, 23; Brussels, 15; Amsterdam, 14; Moscow, 11; Rome, 8; St. Petersburg, 7; Madrid, 8; Lisbon, 2.

The causes of suicide in European countries are reported as follows:

Of 100 suicides: madness, delirium, 18 per cent.; alcoholism, 11; vice, crime, 19; different diseases, 2; moral sufferings, 6; family matters, 4; poverty, want, 4; loss of intellect, 14; consequence of crimes, 3; unknown reasons, 19.

The number of suicides in the United States, six years, 1882-87, was 8226. Insanity was the principal cause, showing the favorite method; 5386 acts of suicide were committed in the day, and 2419 in the night. Summer was the favorite season, June the favorite month, and the 11th the favorite day of the month. The month in which the largest number of suicides occurs is July.

The number of suicides in ten American cities in 1895 was as follows: New York, 376; Chicago, 350; Brooklyn, 161; St. Louis, 134; San Francisco, 110; Philadelphia, 95; Boston, 77; Cincinnati, 65; Baltimore, 43; Providence, 11.

SUMNER, WILLIAM GRAHAM, was born in Paterson, N. J., in 1840. He was graduated at Yale College in 1863, and then studied at Oxford, England, and at Göttingen in Germany. From 1866 to 1869 he was a tutor at Yale College. In 1867 he took orders in the Protestant Episcopal Church, and for a short while was assistant at Calvary Church in New York. In 1872, however, he became professor of political and social science at Yale College, which position he has since held, one of the leading economists in America of the orthodox school, especially on the subjects Free Trade and Gold Currency. His best

known works are *History of American Currency* (1874); *Lectures on the History of Protection in the United States* (1875); *What Social Classes Owe to Each Other* (1883); *Protectionism* (1885.)

SUMPTUARY LAWS are laws which seek to restrict and regulate private expenditures. They have been attempted by all countries, even by the modern American States. Most economists to-day, however, agree with Adam Smith when he says: "It is the highest impertinence and presumption in kings and ministers to pretend to watch over the economy of private people." The latest piece of true sumptuary legislation in Great Britain was the Scotch law of 1861.

SUNDAY LABOR.—With the religious and theological arguments raised for the limitation of Sunday we are not in this encyclopedia concerned, save as these affect the moral and physical welfare of society. But in the ever increasing complexity and stress of modern life, it is patent to all that men more and more need a rest, at least one day in seven, from their daily toil. It is to-day substantiated, beyond all question, that man in the long run can produce more and better work, by resting one day in seven than by continuous work. It is well known that, if a mason or carpenter takes a contract for a job of work to be done in Paris, he gets his work done quicker, cheaper, and better with English help which works only six days in the week, than with French help which works seven days.

Such facts could be multiplied to almost any extent, all showing that men and women will do more work and do it better when they have their Sabbath for rest. And such men and women will live longer and more happily. They will stand higher on the scale of intellectual, moral, social, spiritual being.

Dr. Chalmers of Scotland said: "I never knew the man who worked seven days in the week without becoming soon a wreck in health or in fortune, or in both."

Edmund Burke said: "A nation that neglects the Sabbath soon sinks into barbarism or ruin. Civilized man cannot bear the pressure of seven days' work and worry in a week."

Yet it is also a well-proven fact that Sunday labor in the United States is on the increase. It has been estimated that, in Massachusetts alone, 50,000 persons—men, women, and children—have to labor. On railroads, on street railways, in livery-stables, in making repairs (often only done on Sunday, because employers are unwilling to forfeit weekday dividends), in bakeries, in hotels, in private houses, in barber shops, in drug stores, in printing offices, in theaters and places of amusement, a constantly increasing amount of work is done on Sunday. Working men bitterly complain of this, yet too often find even the Christian Church turning a deaf ear to their cry, and clergymen unwilling to cooperate in limiting the hours of labor. An American Sabbath union exists in New York City, and local leagues, such as the New England Sabbath Protection League, exist in various localities.

Some literature is published, but little adequate effort is made, and what is done is often on narrow lines. Much Sunday labor need not be done at all, but when it is necessary, the worker should be given a free day some other day in the week; or men should alternate in doing Sunday work. It is often forgotten, too, how intimate is the connection between a half holiday on Saturday and the necessity for Sunday work. If the half Saturday prevailed in America *all through the year*, to the extent to which it does in England, there would be less need of making Sunday a day of excursions into the country for the city working classes, and therefore less necessity for Sunday trains, cars, etc. The cheapening in the price of bicycles too and use of electric private carriages would result in less demand for Sunday trains and cars. Many believe that the Sunday problem is to be fought out on economic lines of lessening the hours of labor generally (see **SHORT-HOUR MOVEMENT**) rather than on strict religious lines.

In Continental Europe, where Sunday labor is still more common than in America, the experience all shows the need of the Sunday rest, and there is a growing movement for its enforcement. **Europe.** Sunday Rest Leagues exist in France, Belgium, and Italy, and elsewhere. These are largely supported by the clergy, Catholic and Protestant, yet the main efforts in this direction come from the working men themselves. In France and Belgium the main effort is to close the stores on Sunday afternoons. The Paris League has 4000 members. In Germany, during 1896, the Prussian government took steps to free 50,000 railway freight employees from all Sunday work. In Austria all Sunday work except that also entirely necessary is forbidden. In Switzerland, Sunday laws have been passed by half the cantons.

England is in somewhat the same condition as America on this point. It has been estimated that at least 300,000 in English dominions are employed on Sundays on railroads alone.

SWEATING SYSTEM, THE, may be defined as that system of the production of goods for sale, particularly prevailing in the clothing trades, whereby the wholesalers buy their goods of middlemen (or sweaters), who employ men, women, or children to manufacture the goods at the lowest possible wages, either in hot small rooms (sweat-shops) belonging to the sweater, or taking the materials to their own homes and making them there for usually still lower prices. As long ago as 1849 a series of letters in the London *Morning Chronicle* showed the horrors of the sweating system in London, and called out Charles Kingsley's burning tract, *Cheap Clothes and Nasty*.

This tract tells of men working in sweating dens, the longest hours for seven days in the week, and paying the sweater for the most meager board such rates that, at the end of the week, they would be in debt to the sweater and thus be in his power and be compelled to

stay on. To-day the system exists in England and in America, in almost all branches of the clothing trade, to an alarming extent. Owing to the efforts of the Anti-tenement-house League (*q. v.*), Congress appointed in 1892 a committee to report upon the matter. This committee reported that probably the manufacture of clothing was in total value the most important product of the country; that it was largely centered in cities; that over 60 per cent. of the clothing sold was ready-made, and that about one-half of this was made under the sweating system. Clothing made under this system they declared to be made in premises usually filthy, in the slums and crowded portions of the cities, from places liable to breed germs of disease which could be carried in the clothing, and producing evil in every way. The worst form of the system, the report says, is when the clothing is not made even in sweating dens but is carried home to be made in the tenements under conditions sometimes defying description.

Various efforts have been made to reform and mend the system. (For attempts to organize the workers into unions, see **TAILORING TRADES**) These attempts, however, have as yet been only partially successful. Efforts have been made to mark with labels clothing made under proper factory conditions, hoping that the public would patronize such clothing, but little good has resulted. Still less successful have been the efforts to establish cooperative tailor shops. The competition of the cheap prices of the sweating system has been too strong for these stores to succeed. Several States have appointed commissioners to supervise the system and allow clothing to be made only in licensed places. This has done some good, but too often the law has been avoided or evil connived at. The above-mentioned report says:

"We quote and adopt the reasoning of Dr. Daniels. The one method that can be employed by which we shall be certain that no article is manufactured in tenement-house living rooms, and that no little children are employed in the manufacture of any goods, is the passage of a law prohibiting such manufacture in tenement-house apartments which are used for living and sleeping purposes. . . . Undoubtedly under such a law a few would suffer. The people who would suffer would probably be only a few women who, from old age or chronic illness, are unable to go to the shops to work. The widows would be forced to find work in the factories, and the orphans sent to school, kindergarten, or nursery. The result would be that women would work in better sanitary surroundings, that no children under 14 years would be employed in manufacturing goods; the sick would receive proper care, if not at home, then transferred to a hospital, there to get well or die out of sight of the everlasting work.

"I should say that the life in tenement-houses, plus manufacturing in tenement rooms, if continued, would eventually bring forth brutal, unhealthy men and women."

See **SLUMS**; **TAILORING TRADES**.

SWINTON, JOHN, was born in Illinois in 1830 and learned the printer's trade. In 1850 he moved to New York City and studied law and medicine, but, returning to journalism, was chief of the editorial staff of the *Times* during the war, and till 1869. He then was with Greeley (*q. v.*) on the *Tribune* till 1879, and chief writer on the *Sun* till 1883, when he resigned and established *John Swinton's*

Paper, a radical labor paper, which attained to great influence, but failed in 1886, since when Mr. Swinton has returned to ordinary journalism. In 1874 he was nominated for mayor of New York on a workman's ticket, but received only 200 votes. He has, however, been a favorite speaker and leader in all New York labor meetings.

SWITZERLAND AND SOCIAL REFORM, STATISTICS ON.—August 1, 1291, the men of Uri, Schwyz, and Lower Unterwalden, formed a defensive league. By 1513, 13 cantons had joined. In 1798 a Helvetic Republic was declared. This gave little satisfaction, and in 1803 Napoleon gave a new constitution for 19 cantons. In 1815 the powers guaranteed the inviolability of her territory and a federal pact was accepted with 22 cantons. In 1848 a new constitution was adopted, and in 1874 the present one. Switzerland is now a confederation; the federal government being superior in matters of peace, war, army, post and telegraph, revenue, money, weights and measures, and large public works.

There are two chambers, a *Ständerath* or State Council of 44 members, two for each canton, chosen as the canton will, and a *Nationalrath* of 147 delegates, or one for each 20,000 souls, chosen by universal male suffrage. A general election takes place every three years. Any man, not a clergyman, may be elected. The president and vice-president are elected annually by the Federal Assembly.

The cantons have a large degree of local self-government; the small ones being governed by the *Landsgemeidin*, the large ones by a *grosse Rath*.

The Referendum and the Initiative (see **REFERENDUM**) are all but universal. The total population, June, 1894, was 2,986,848, on 15,976 square miles. In 1888, 1,106,430 were engaged in agriculture.

There is complete religious liberty, about 59 per cent. of the population being Protestant, and 40 per cent. Roman Catholic. Education is very general, but not centralized. (See **EDUCATION**.) The revenue in 1894 was 84,047,312 francs, the expenditure 83,675,812 francs. The main source of revenue was customs; the main expense, military. The public debt January 1, 1895, was 85,203,586 francs.

There are 300,000 peasant proprietors. (See **AGRICULTURE**.) The imports in 1894 were 880,845,540 francs; the exports, 673,004,524 francs. In 1895 there were 2267 miles of railway (private). The telegraph is owned by the government.

SOCIAL REFORMS.

Switzerland, in many respects, leads the nations in social reform. In no country are democratic political institutions so fully developed; perhaps in no country is there so much industrial democracy. For the adoption in Switzerland of the important principles of direct legislation, see articles **REFERENDUM** and **INITIATIVE** and **PROPORTIONAL REPRESENTATION**. In no country have these reforms been carried so far or so successfully. Switzerland has also largely adopted the principles of the

progressive income tax (*q. v.*). In the lines of socialism, she has the nationalization of the telegraph (*q. v.*) and telephone (*q. v.*). She is preparing to nationalize her railroads (*q. v.*) and has the nationalization of the traffic in alcohol. (See SOUTH CAROLINA DISPENSARY SYSTEM.) She is making important experiments in employing the unemployed. (See UNEMPLOYMENT.) She carefully controls, and is preparing to nationalize her banking system. Among her most important developments is her political recognition of organized labor. In 1887 the office of Workman's Secretary was founded, its incumbent to be practically a member of the Federal Cabinet, and to be paid by the government, but to be elected by the Swiss labor unions, thus to some extent making them a recognized part of Swiss political institutions. Swiss municipal institutions are, however, equally progressive with national institutions. Cities like Zurich and Basel in German, and Geneva in French, Switzerland, are among the most progressive municipalities in the world. They care minutely for the housing of the working-classes, they strive to give work to the unemployed; they have municipalized most of the natural monopolies—they thus receive large municipal revenues with low rates of taxation; they have developed some of the best industrial schools of the world. (See INDUSTRIAL EDUCATION.)

Municipalism.

Switzerland thus seems to lead the world in political democracy and in a constructive, tho often in an unconscious, socialism. The development of conscious socialism, however, has been somewhat weak and to a large extent of foreign importation. Switzerland has long been the asylum of political refugees from other lands.

Socialism.

Thus Geneva has been the shelter from which at one time Mazzini tried to rouse a *Young Europe*, which Bakounin sought to make the center of anarchism, and from whence Russian nihilists have tried to reach Russia. But these movements have little affected Switzerland. Driven from Germany by the Anti-Socialist law, many German socialists found refuge in Basel, and somewhat developed German socialism in Switzerland, yet after all not at all commensurably with the Swiss development of unconscious socialism. In 1864 a branch of the International was founded in Geneva, and by 1869 32 branches were said to exist in Geneva alone. But the movement did not endure. (See INTERNATIONAL.) In 1888 the present Social Democratic party of Switzerland was formed, and has continued ever since an active propaganda on the lines of German socialism, yet without reaching large numbers; perhaps exactly because there is so much unconscious socialism in Switzerland. More important is the great Swiss labor organization, the *Grütli-verein*. This was founded in 1838 at Geneva, taking its name from the scene of the original Swiss federal pact of 1307. It has to-day several hundred branches, and is largely socialistic and the main expression of the socialistic tendencies of the Swiss laboring classes.

SYNDICATE BOND CONTRACTS.—

In 1894, 1895, and 1896, the United States Treasury declared itself compelled to borrow money by the issue of bonds. The occasion of this is variously explained by different bodies of thinkers. Believers in protection claimed that it was occasioned by a deficit in the United States Treasury due to the repeal of the McKinley act and the reduction of the tariff. Others claimed that it was due to a deficit of income, due to large expenditures, and to involved causes incident on general depression. Some Democrats claimed that it was not due to a deficit in the Treasury at all, but to the silver agitation causing "lack of confidence" and the withdrawal of gold from the Treasury, and that it was absolutely necessary to borrow gold in order to keep up the credit of the United States, and they considered Mr. Cleveland to have energetically and rightly saved the honor of the country. Believers in free silver claimed that there was no necessity to issue the bonds, but that the necessity only arose in the policy of the administration in discriminating against silver and insisting in paying out gold, even where gold was not called for. Extremists declared that it was a plot of the bankers against the government, or even a deal with the administration to make large profits for New York and foreign gold syndicates. It was strenuously asserted that the government had no right to issue such bonds. Be this as it may, and whatever the cause, the Secretary of the Treasury, Mr. Carlisle, planting himself on laws of July 14, 1870, and January, 1875, authorizing the issue of bonds to redeem government notes, declared that he had the right to issue bonds. In February, and again in November, 1894, issues were made of 5 per cents. for \$50,000,000 and sold to New York banks. They did little good. The banks paid in the gold to the Treasury, and the gold was soon withdrawn, sometimes by the very parties who had paid it in. In February, 1895, conditions were as bad as ever. The gold reserve had fallen to \$41,340,181, instead of the \$100,000,000 which it was desired to keep in the Treasury. The administration was, or at least declared that it was, in the money-lenders' hands. If it made an ordinary loan from the banks the gold would soon be withdrawn. After a few days' correspondence, therefore, it issued to a syndicate, with Mr. J. P. Morgan at its head, 30-year bonds at 4.49 per cent. over their face value, for \$65,000,000 of gold, the syndicate agreeing on its part to obtain one-half the gold from Europe, and "to protect the Treasury of the United States against the withdrawal of gold pending the complete performance of this contract." This was hailed as "patriotism" on the part of the bankers and denounced as a "steal" by the free-silver men. For a while relief was gained, but by August or September the agreement with the syndicate mutually broke down—it was claimed without the fault of the syndicate—and things threat-

ened to be as bad as ever. The Secretary then prepared to make another issue. But J. Pierpont Morgan formed another syndicate and corresponded with the administration about making another contract with the government under terms still more advantageous to his syndicate. But there was so much opposition, both in Congress and without, led principally by the *World* of New York City, that January 1, 1896, the administration, instead, called for a popular loan of \$100,000,000, which was taken up; and when the bids closed February 5, it was found that they had reached \$565,000,000. The Morgan syndicate (it was declared by critics that it did so by connivance of the administra-

tion) secured \$33,211,350 at the rate of 110.6877, the remaining \$66,788,650 going to higher bidders. The average rate was 111.3878, and the Treasury netted \$111,378,836.

Thus millions of dollars were added to the national debt, and besides their interest the gold syndicates made large sums by the deal. On the bond of issue of February 8, 1895, alone the Morgan syndicate, by paying a premium of 104,495 and immediately selling the bonds to inside jobbers at 112.5, cleared \$4,988,620, while the jobbers, by selling at 119, cleared \$4,050,503. These bonds alone thus cost the United States \$9,039,123 by the favorable terms given the syndicate.

T.

TAILORING TRADES.—Industrial conditions in the tailoring trades have been for the last 50 years perhaps worse than in any other branch of industry. The tailoring trade is *par excellence* the trade of the sweater. This was so in London, when the horrors of the sweating system, 50 years ago, roused the indignation and sympathy of Charles Kingsley and the Christian Socialists. It is true to-day in England, America, and Germany. The reasons for this are mainly two. In the first place, few trades demand, at least in the lower branches of the industry, less capital. Any one who can buy or hire two sewing-machines, or even one, can become not only a worker, but a sweater, taking in garments to be sewed, and hiring an assistant, who need be paid little more than his or her scanty board. No shop is needed; the worker's one room in a tenement can be the shop. This makes it possible for the poorest, most ignorant, and least responsible to become sweaters, and in the competition for low prices it gives a fearful advantage to the tenement sweating shop. The second reason for the terrible conditions prevailing in the tailoring trade is that no other trade so easily allows of women and children taking work *to their homes*. In most other trades invaded by woman's labor, the women or girls are required to go to some factory or shop. In the tailoring trade they can take their work home, and work at it when they will, by day or by night. They can do it without neglecting the care of children or of their tenements. The result is that they can do this work cheaper than any other, and under competition are usually driven to do so. The result of these and other conditions, resulting, that is, from the above combination of the possibility of little capital and home work, makes the tailoring trade almost identical with the sweating system (*q. v.*). It is now

The Trade. the only trade not commonly carried on in a factory, and therefore with much more difficulty supervised by the State or inspectors of any kind. Yet it is a trade of vast proportions. According to the census of 1890, there were in the United States 121,586 tailors, 63,611 tailoresses,

289,083 dressmakers, 149,704 seamstresses, in all 623,984 persons, a larger number than in any other manufacturing industry. The product of the clothing trade in 1890 in the United States was over \$700,000,000. In England, 1,099,833 persons were employed in the various portions of the dress industry (including boot and shoe, but not textile industries). Yet it is a concentrated industry. In the United States the tailoring trade proper, or the manufacturing of ready-made clothing, is concentrated in New York, Brooklyn, Philadelphia, Boston, Baltimore, Newark, Utica, Rochester, Syracuse, Cincinnati, St. Louis, Chicago, and Milwaukee, and in the crowded and most filthy portions of these cities. Including shirt and undergarment makers, the trade employs 100,000 persons in or near New York alone. In London, 120,000 women are employed in millinery and in the making of clothing. In 1891 the value of apparel exported from London was £3,096,152.

To affect labor organizations in such a trade is unusually difficult. To this there is only one exception, and that an apparent one. The trade employs one class of high-paid labor, the cutters, and these are well organized. An unskilled or careless cutter can ruin or waste a great deal of cloth, while a skilled cutter can largely add to the value of a product otherwise turned out by unskilled labor. It therefore pays the employers to hire well-paid cutters, tho for the rest employing the cheapest and most unskilled labor. The result is that cutters are able to organize effective unions and obtain favorable conditions; but this rather adds to than subtracts from the difficulty of organizing the whole craft. It creates such a difference between different branches of the trade, that it was long before organizations came into existence even attempting to embrace the whole craft. This explains the fact that tho both in England and America tailors were among the first trades to organize, the craft as a whole is one of the most disorganized and most exposed to impositions and low payment from selfish and ignorant employers. The small contractor is the central evil. He takes jobs at the lowest competitive price, and gives out the work to

women in tenements, or to men and girls in sweating dens. The prices at which this work is done enable the firms to sell the goods at

such low figures, that firms who desire to sell goods at fair prices cannot compete. Hence, the efforts to organize cooperative tailor stores, "clean shops," etc., have invariably been killed by the sweat-

Tailors' Unions.

ers' competition, while at the same time the conditions have made it almost impossible to organize the poorer workers. Thus while the English trade-unions seem to have begun among the London tailors; while a tailors' organization existed in New York City in 1806; while the great movement of the Knights of Labor (*q. v.*) began among the Philadelphia tailors; while a somewhat strong Amalgamated Society of Tailors has existed in England since 1866, and Cutters' Unions have long existed in the United States (in New York City since the forties), nevertheless the whole trade has been very little organized. In England a National Society of Tailors was effected about 1843, but did not endure; even the much stronger Amalgamated Society of Tailors and the Scottish National Operative Association, both organized in 1866, have not succeeded in maintaining wages or organizing but a small portion of the craft. In the United States, Cutters' Unions did not unite with the rest of their craft till the United Garment Workers of America was organized in 1891. This is a comparatively efficient national union, under the lead of Charles F. Reichers, President, and Henry White, General Secretary. It publishes a monthly organ, *The Garment Worker*, with portions in English, German, Hebrew, and other languages. It led in a series of strikes in 1894, which raised wages and shortened hours in several cities, tho the depressed conditions since have led to the loss of most that was gained, and strikes in 1896 were not nearly so successful.

The following statistics as to wages and conditions in the tailoring trade are abridged from the report of an investigation made by Miss Isabel Eaton, a Fellow of the College Settlements Association in 1893-94, and printed by the American Statistical Association. Since then wages and conditions were raised a little by strikes in 1894, but have since returned to about the same level, so that these statements may be taken as true at present (1897):

TRADE.	Regular Weekly Wage.	Weekly Wage 1893-94.	Months in an Ordinary Working Year.	Average Yearly Income of Family.	Average Number of Family.
Caps	\$11.84	\$5.82	7.83	\$197.47	4.00
Coats	11.53	4.90	7.42	157.53	4.94
Cloaks	11.65	4.92	6.40	127.92	4.40
Tailors	10.00	3.72	7.82	126.06	4.80
Vests	10.50	4.85	7.10	149.24	4.70
Trousers ..	8.92	3.92	7.50	127.28	4.64
Shirts	8.21	3.95	8.15	139.53	4.70
Knee pants...	7.21	8.00	4.50

Miss Eaton says:

"Thus we find that the best paid of these trades, cap-making, affords \$100.43 for the maintenance, for a year, of each member of the family in ordinary times, the wage-earner working therefor 12 hours a day. . . . In the other branches of garment-making the weekly income of individuals would, of course, be even less. This proportion then may be taken as being indicative of the present condition of wages. . . . But wages are not the only source of income to the working men. The income from wages earned by the head of the family alone is frequently augmented by the earnings of one or more other members of the family. The mother may be a 'home-finisher,' and may do sewing on underwear or on children's knee pants in the pauses of her cooking or other domestic work, or the children who are 14 may be taken out of school and set to vending papers or pulling bastings for 50 cents a week. Also in many cases the income is eked out by taking lodgers.

"But in the families of over 1000 union men only 28 per cent. were found having any additional income. In the shirt-making trade 40 per cent. have other income, a high average probably accounted for by the nature of the work, well calculated to attract women and children, and also for the reason that the low wage paid to shirt-makers forces them to augment their scanty incomes in every possible way.

"In regard to lodgers, conditions are bad. The average number of rooms per tenement is 2.6; but it often occurs that five or seven people are living in one room."

Wages of cutters, the skilled men of the craft, and well organized, are much higher, from \$18 to \$20 per week.

EXPENSES.

	Cost of Food a Week.	Cost of Clothing a Year.	Number of Rooms.	Rent Per Month.
Caps	\$5.85	\$64.05	2.85	\$11.21
Coats	4.89	59.19	2.78	10.12
Cloaks	5.60	56.24	2.70	10.31
Vests	5.37	61.09	2.60	9.00
Trousers	5.00	49.46	2.58	9.56
Shirts	5.68	47.30	2.50	8.85
Knee Pants	4.41	51.47	2.37	9.47
Average of these averages.....	Food. \$5.26	Clothing. \$54.82	Rooms. 2.6	Rent. \$10.00

Says Miss Dutton:

"The average family (numbering 4.52) spends on the item of food \$5.26 a week in 'good times.' Working men to whom this inquiry has been put state that this agrees with their observation, and say that a great many families spend much less for food than \$5. . . . The average yearly cost of clothing to the individual in the family is, in the cases considered, \$12.10. Many report \$50 as the yearly expense for the clothing of a family of four or five members, and many report even less, \$30 and \$25 being frequently given as the yearly amount.

"It is the custom for the people to buy second-hand goods. According to Mr. Rosenthal, 'they wear only second-hand shoes,' which, he explained, are 'the kind that drop to pieces when they get wet,' either because they are only pasted together, or because parts of them are not made of leather but of pasteboard, or some other preparation of paper. It appears that men's shoes cost from 60 cents to \$1.00, second-hand, and children's cost sometimes as little as 20 cents a pair. A man's overcoat costs him only \$2 or \$3. Nearly every article of clothing or of household furniture is to be had in some stage of dirt and decrepitude at the Hester Street shops—a hat for 40 or 50 cents; both coat and trousers for \$1.50 or less; and so on throughout. . . . In most cases expenditure exceeds income. In the investigation of the question of indebtedness, the schedule first prepared read; 'Are you owing anything for rent?' a question which invariably elicited a negative reply. At last, after several hundred cases, all showing incomes insufficient

to balance expenses, I said to Mr. Rosenthal, 'How do you explain such facts as these records show—income, \$277; expenditure, \$400? That is the way they all come out. Does it mean hasty and inaccurate estimates of cost of food a week, etc., or does it mean that it comes out of the landlord for rent when the family moves out in debt?'

Debts. The answer ought not to have been a surprise, perhaps; but it was: 'No, madam; it mean the working man is bankrupt. He owes \$20 or \$30 to his grocer, the same to his butcher, and maybe he has things in pawn for his rent. No, the landlord is the last to lose. How can he lose more than one month? Everybody gets in debt in January and February; and in April, when business is brisk, they begin to earn and then pay their debts as near as they can.'

"After this the schedule was altered to read, 'Are you owing anything for food, clothing, or rent?' with the result that 61 out of 100 trousers-makers confessed to being in debt, only 15 of them owing anything for rent, and none of them owing for more than two months; of 67 per cent. of 100 cloak-makers, only 11 for rent; of 70 per cent. of coat-makers, 22 per cent. of them for rent, but always for other things, too. . . ."

"On showing these figures to Mr. Ehrenpreis, of the Chicago Cutters' Union, and asking him if they were true of Chicago, I learned that 'if only 60 per cent. of the pants-makers in Chicago are in debt it is because the other 40 per cent. haven't any credit; and if only 40 per cent. of the cutters are in debt, it is because the other 60 per cent. haven't any credit.' And Inspector Bisno states that in the cloak-makers trade in Chicago 'absolutely every man is in debt,' owing the butcher, the grocer, and having in the pawnshop everything he can pawn, and that it is much the same in every branch of garments trades."

HOURS.

The average working day among garments workers appears to be about 14 hours, altho the sweater would like to convince the public that his men work only from 8 to 12 hours daily. . . . Inspector Bisno says that in the busy season there is no limit; that men frequently work all the night, and that even in the slack season there are those who work 15 and 16 hours daily—from 5 A.M. to 9 P.M. On the first visit to an establishment of any size, the foreman, in Chicago as in New York, will follow the record taker about, and on the second visit it is very rare to find a man who will report more than 10 hours, tho they often laugh when they report their 10 hours. . . . The practice of keeping the workers awake by artificial means, in order that they may work from 30 to 48 hours at a stretch, is adopted even with the labor of children. At one time, last December, the girls in certain electric works in Chicago (girls from 15 and 16 years to 20 or over) worked under heavy pressure for 33 hours on a stretch, being "kept awake on black coffee." . . . The luncheon hour has been reported to me in 75 cases. It is no unusual thing for these tailors to run their machines 15 and 16 hours a day—that is, from five o'clock in the morning, at which hour they are all at their work, until 9 and 10 o'clock at night, with an intermission of from 3 to 15 minutes for luncheon. For this work, as the table indicates, the pay varies from \$4 to \$7, or \$8, a week.

PROFITS AND PRICES.

In the cap-making trade the operator can make four dozen caps a day. He makes the whole cover, does all the stitching, puts in the lining, and fastens in the brim. For this he receives from 75 cents a dozen, for the very finest work, to 11 cents a dozen for common carters' caps. The usual price is "about 40 cents a dozen," and the operator can make four dozen a day*—that is, he can earn \$1.72 daily, \$44.72 monthly, \$350.16 yearly, reckoning 7.33 months to the working year. That is \$6.73 weekly the year through. Mr. Glass says that the best workmen can earn from \$8 to \$8.50 the year through. One sweater, whose shop we entered on

* These details are given upon the authority of Mr. Glass of the Cap-Makers' Union of New York City, and the results they show in yearly earnings agree very well with the average estimated upon the 200 cap-makers reported. The yearly earnings here reckoned so nearly coincide with the facts in one case—that of the quickest worker in a certain Green Street establishment, who earned \$325.52 yearly—as to confirm my confidence in Mr. Glass's judgment, the error falling, as I have invariably found in his estimates, on the conservative side.

Sunday, was making a medium quality of cap of blue felt, with stiff black brim and cord, and two gilt buttons by way of trimming. He furnished these to his wholesale dealer at \$1.10 a dozen, and was paying his operators 10 cents a dozen for making. Mr. Glass estimates that he pays as follows:

COST OF MATERIALS.

8 cents a yard for felt (2½ yards to a dozen caps).....	.20
4 " lining.....	.04
6 " a dozen for visors.....	.06
2 " for buttons.....	.02

COST OF MAKING.

10 cents a dozen to operator.....	.10
6 " " " finisher.....	.06
6 " " " blocker.....	.06
<hr/>	
Total cost of one dozen caps....	\$.54
Selling price.....	\$1.10
<hr/>	
Profit.....	.56

So that this cap-maker was making over 100 per cent. gross profit on his outlay.

Compare also the following case, where the retail clothier "takes \$7.63 and turns it into \$18." He does this whenever he sells an \$18 suit of the kind seen everywhere in our streets and offices, and having cut-away or sack coats. In proof of this I give the following estimate (on the authority of Mr. M. Goldberg of the United Garments Workers of America) of the cost, by items, of such a suit and the making of it:

Cloth for suit, \$1.25 a yard (largest suit requires only 3 yards).....	\$3.75
Lining, 40 cents a yard (one yard for coat and vest).....	.40
1½ yards white lining, 18 or 20 cents a yard (for sleeves, vest, and trousers?) ..	.28½
Canvas for coat and trousers, about one yard, at 10 cents a yard.....	.10
Buttons, etc. (all the trimmings).....	.20
Pocketing (coat and trousers).....	.12
<hr/>	
	\$4.85½

Contractor furnishes this grade of clothing to the trade as follows:

Coat, \$1.50 to \$1.75.....	\$1.62½
Vest, 35 to 40 cents.....	.37½
Trousers, 35 to 40 cents.....	.37½
Cutter (paid \$20 weekly), making 12-14 suits a day; cost of cutting one suit.....	.25
Lining cutter about.....	.15
<hr/>	
Total cost.....	\$7.63

The retail clothier, then, receives suits from the hands of the contractor for \$7.63, all told, and this on a liberal estimate in his favor; in point of fact, it often costs him less. He then sells them for \$18 apiece.

In the coat-making trade the operator gets from 10 to 50 cents apiece for doing all the machine work (except the buttonholes) on a man's coat, and can make from 4 to 10 coats a day. Taking the arithmetical mean as the average price paid for one coat, and the number of coats in an average day's work, it appears at first that the coat-making operator gets fairly good pay for his work (7 times 30 = \$2.10). By further calculation it is evident that \$2.10 (daily wage) multiplied by 6 (number of days in a week), multiplied by 4½ (number of weeks in a month), multiplied by 7.2 (number of months in a working year of coat-maker), gives as a total \$405.13. This is the coat-maker's yearly income, and consequently his weekly income the year through diminishes to \$7.79, which is very different from \$12.60, his weekly wage. (These estimates are given on the authority of Mr. Leo Schwartz of the Coat-Makers Union in New York. Whether they are based on the Union records or on Mr. Schwartz's judgment, a comparison of them with the averages estimated on 185 cases reported gives sufficient evidence of their accuracy.) Besides the operator, the trade employs basters, fellers, buttonhole makers, basting pullers, bushelers, and pressers. The baster gets from 20 cents to \$1 a piece, and can do from 1½ to 5 coats a day, his weekly income the year through being \$8.35, and his yearly income, \$434.07. The feller gets from 2 to 8 cents apiece, and can fell from 10 to 30 coats a day,

Coat-Making.

his weekly income the year through being \$4, and his yearly income, \$208. The buttonhole maker is paid from one half to two cents apiece for every buttonhole, and each coat has four or five. Mr. Schwartz estimates that the number made daily ranges from 60 to 300, and the average weekly income the year through, which is figured from this estimate, is \$8.35, and the yearly income, \$434.07. The basting pullers are usually children, and are paid a mere pittance, rarely more than \$1.50 a week in the season, and often as little as 50 cents a week. The highest of these figures would show a weekly income the year through of only 90 cents, and this is true even where their hours are practically the same as those of adults. The bushelers are usually girls, and receive \$6 a week in season. Pressers receive from 5 to 20 cents apiece, and can do from 8 to 20 coats a day, showing a weekly income the year through of \$6.49, and a yearly income of \$337.61 (tho the presser is said in extreme cases to get as little as one cent a coat). This shows the average yearly income of coat-makers (exclusive of the girls and children employed) to be \$363.73. A comparison of this average yearly income based on Mr. Schwartz's estimate with the average yearly income based on 185 cases reported individually to me shows a difference of only \$7 in the total earnings of the year. The average deduced from the 185 cases shows \$370.73 as the average yearly income.

The earnings in the shirt-making trade show a much lower scale of figures than those in the cap-making and coat-making trades, as would naturally be expected. One of the working delegates of the Shirt-Makers' Union, Mr. Solomon Berman, has given me the following estimates, covering the various divisions of the shirt trade: The operator on collars gets 5½ cents a dozen, and can make 12 or 13 dozen a day, showing \$2.81 as weekly income the year through. Some make even less, as many young boys "go in to make pin money." Operators on fronts (without pockets) get from 2½ to 9 cents a dozen, and can make about 15 dozen a day, earning \$3.80 weekly the year through. Those making fronts with pockets receive from 4 to 14 cents a dozen, and can make 8 dozen a day, earning a weekly income the year through of \$3.05. Sleeving pays from 6½ to 9 cents a dozen, and it is possible to do from 10 to 12 dozen a day, showing \$3.72 weekly through the year. Putting in sleeving pays from 5 to 8 cents a dozen; average about 14 dozen a day. This gives \$3.82 weekly through the year. The hemmer gets 2 or 3 cents a dozen, can do 40 to 50 dozen a day, and earns weekly the year through \$4.76. The buttonhole maker receives 4, 5, and 6 cents a dozen, and can do 25 to 30 dozen daily. He earns \$5.82 weekly the year through. In one Hester Street shop a buttonhole maker was found getting 10 cents for 100 buttonholes. Finishers (always girls) receive 3 cents for finishing a dozen shirts, and earn only 30 cents a day. Packers receive 3 cents a dozen, do 30 or 40 dozen a day, and earn \$4.44 weekly the year through. These shirts, which the contractor furnishes to the merchant at about 50 cents a dozen (prices range from 35 cents to 65 or 70 cents), are selling, according to the statement of one Cherry Street sweater, at prices ranging between \$9 and \$18 a dozen.

Shirt Making.

In the knee-pants trade there is less division of labor than in shirt-making, knee-pants work requiring, besides the cutter, only an operator, a finisher, and a presser. The operator does all the machine work—the seam on each side of the leg, a triple seam in front (on each side of the fly, which has two seams on the buttonhole side), and the seam in the middle of back, four rows of stitching all the way around the top (two on each side of the band), and the stitching in of the pockets—12 seams besides the pocket stitching. For this work, which is almost equivalent to the entire making of a pair of knee pants, the operator receives usually from 24 to 30 cents a dozen pairs, and often receives only 22 cents a dozen pairs, or less than 2 cents for the making of one pair. (The price sinks in Chicago even lower than this, as girls and women make about half the knee pants in that city. The operator sometimes receives only 18 cents a dozen in Chicago.) Finishers in New York do the stitches around the "feet," sew on the buttons—sometimes 10, sometimes 16 (these being 10 buttons on the ordinary knee pants at the knees by way of trimming, and in the band, and there are 16 buttons in the kind which button on to a shirt-waist). They also make the three buttonholes in the fly. For this they receive 6 and 7 cents a dozen pairs. That is to say, they finish 24 "feet," sew on at least 120 buttons, and

Knee Pants.

make 36 buttonholes for 7 or 6 cents. These finishers, again, are generally girls. Knee-pants pressers receive 7 or 6 cents—sometimes only 4 cents—for pressing a dozen pairs. In one Attorney Street shop, which appears to be about the average knee-pants sweatshop, I found the operators were receiving 2½ cents a pair, and working 17 or 18 hours a day. Finishers were here receiving \$4 a week.

These prices give the explanation of some of the bargains and advertisements which appear in our stores and newspapers. Miss Dutton gives some examples. One Philadelphia advertisement, printed on large stiff cards and sent broadcast through the mails to most of the large clothing houses in the country, says:

"I am the Largest Manufacturer of Low-Priced Clothing in these United States; the following price-list will convince you of this assertion."

Knee pants.....	\$2.50 per doz., net, and upward.
Men's pants.....	6.00 " " " " "
" " (our lead-ers).....	12.00 " " " " "
Men's suits.....	3.00 a suit and upward.
" " blue chevot suits.....	3.00 " " " "
Children's coats and pants (4 to 13).....	.62½ a suit and upward.

Samples sent at your request.

A marginal note in red ink explains that the knee pants at \$1.50 per dozen are "some of the goods we are compelled to meet competition on in knee pants." These are wholesale rates on new clothing.

An uptown firm in New York City advertises a boy's yachting suit for 89 cents; double breasted suits (sizes 4-15 years) for \$2.49; cassimere and fancy chevot suits for \$1.98; fancy cassimere and chevot short pants for 39 cents; boys' pants of wash material, 35 cents.

In England conditions are about as in America. According to Booth's *Life and Labor of the People*, vol. iv. (1893), the London tailoring trade is divided between the wholesale trade in ready-made clothing and the "bespoke" (made to order) trade. The work in the former line is done by Jewish contractors, with large numbers of **England.** fixers, basters, fellers, machinists, buttonhole makers, and pressers.

Jewish men and women and English women, unorganized and unregulated. The "bespoke" work of the West End and city trade is done (a) by well-paid, skilled English tailors; (b) by English and German tailors in their homes, and poorly paid; (c) by Jews and women. With the wholesale Jewish prices English tailors cannot compete, and according to Mr. Booth an increasing amount even of the bespoke trade, even in the West End, is being done by Jews and by women.

A well-paid journeyman English tailor averages during the year from £1 to £2 per week, and the hours are from 7 to 9. In the smaller Jewish shops employing less than 10 workers each, but which are 80 per cent. of the Jewish shops, the hours are for men 13 or 14, for women nominally 10½, to conform with the Factory and Workshop Act, tho the really overtime is very common, and usually not paid for. Wages for men in these shops are from 4½d. per hour for men and 2½d. for women, to 9d. per hour for men and 6d. for women (for exceptional skill). A limited class of Jewish women never earn more than 15. 6d., and frequently only 15. for 12 hours' work. In their turns women take home coats to be made throughout sometimes for 7d. From 1871-81 the number of women in the London tailoring trade increased 25 per cent.,

while the men decreased. Working in their homes on cheap waist coats, women earn from *1d.* to *3d.* per hour; on shirts, if young and strong, *2d.* or *2½d.* per hour, or with a machine, *3d.* Children work at home from 8 in the morning till 9, and occasionally 11 at night. Workers on furs in the East End earn from *9s.* to *10s.* per week. In a corset factory 5 per cent. of the girls and women earn from *4s.* to *6s.* per week.

TAMMANY SOCIETY.—This political society was organized in New York City by an upholsterer named Mooney in 1789, and named for a Delaware chief, facetiously chosen in the latter part of the Revolution as the patron saint of the new republic. Organized ostensibly for charitable purposes, it had a definite political character from the start, representing the popular distrust of aristocracy and of Hamilton's federalism (*g. v.*). It gradually became the machine of the Democratic Party in New York City, at times very corrupt, especially when connected with the Tweed Ring (*g. v.*). It was then reorganized and to an extent reformed. It is usually regarded as synonymous with all that is bad in American city politics (see RINGS; TWEED RING, etc.); but there is another side. Some believe that political organization in a machine of some kind is inevitable, if not desirable, and that Tammany has only become what its constituency has made it, and that the only way to reform it is to enter it and make it, since it must be a power, a power for good rather than for evil. It is claimed by some to day that it is not wholly evil. A tract by Mr. A. B. King, called *The Political Mission of Tammany Hall* (1892) argues thus. It does not deny the evil in Tammany, but sees in it some good and the possibility of much. It says:

"It is necessarily the most plastic and susceptible of organisms. . . .

"The Tweed ring scandal and the Tweed ring tyranny occurred at a time and among a group of men who were ripe for the fulfillment of the most high-handed and vicious schemes of political ambition and temporal gratification. The public atmosphere was itself infected by the contagious germs of political corruption. A disease of public disorder and rapine more or less infected the social organism; it was apparent at Washington; it broke out in the larger cities; and, in the business world, the vast inflation of prices from an expanded and a depreciated currency engendered baseless enterprises, wild-cat investments, and fictitious bonanzas. Mr. Roosevelt has truly remarked of this period, that it was an 'era of gigantic stock swindling.' The enormously rich stock speculators of Wall Street in their wars with one another and allies to be hired for money in the State and city politicians and in judges, who were acceptable alike to speculators, politicians, and mob. There were continual contests for the control of railway systems, and 'operations' in stocks, which barely missed being criminal, and which branded those who took part in them as infamous in the sight of all honest men; and the courts and legislative bodies became parties to the iniquity of men composing that most dangerous of all classes, the wealthy criminal class. . . .

"The debauchery of Tammany Hall under Tweed was complete. A picture of successful elevation purchased at the sacrifice of all self-respect; an education in the use of the most despicable methods to deceive and cheat the people; the parade of an inordinate vanity, which dressed its self-conceit in reflections upon the weakness and venality of men, these were the incentives the members of Tammany Hall received. . . .

"The ring concentrated its power in itself. It secured

a charter enacted, under the stimulus of bribery, by the New York Legislature, a charter *paid for*, and proving so costly that the power it gave to its authors was the signal means by which the expenses it had involved were successfully liquidated. The disintegration of all moral prejudices and scruples was quite complete. It was offset, however, by the concentration of iniquitous activity in the hands and brains of a few, by the inauguration of this Tweed charter, an instrument correct in principle and progressive in its requisitions. . . . With all this Tammany Hall seemed closely bound. Tammany had always struggled for home-rule, and tho its ends may have been selfish, its efforts evoked in itself a spirit of pride in New York as a city strong and great, and attracted many who felt the vigor and zeal of a metropolitan enthusiasm. . . . And then religious bonds counted for much, and a powerful Church had in one way or another found a political friend in Tammany, and kept its members attached to the same patronage. Tammany felt the sobering influence of the popular revolt against rings and bosses. It amended its ways, or at least seriously thought of doing so. It recognized that the public eye was fastened upon it. . . . Tammany is not an 'unsanctified and incorrigible ruffianism.' The members of Tammany, its bosses and dignitaries, are not fools, they have learned a good many things, and they feel and know that the government of this city cannot be conducted in a happy-go-lucky style with an immoderate admixture of avarice and crime. Clamorous abuse will not improve, reconcile, or renovate Tammany Hall, but persistent representations of what can be done for New York, of the wisdom and benefit of just and clean government, of the strong and elevated position Tammany can attain to will do a great deal."

Reform.

TARIFF.—(See FREE TRADE; PROTECTION.) In this article, for convenience of reference we merely trace the outline of the United States tariff, leaving its principles to be discussed under the above-mentioned heads.

The Congress of 1789 imposed a tariff duty of from 5 to 15 per cent., almost exclusively a tariff for revenue only. From 1802-12 the *ad valorem* duty on dutiable and free articles averaged 19.36 per cent., ranging from 23.40 per cent. in 1804 to 17.88 in 1810. The War of 1812 doubled duties from 1813-15, the rates averaging 33.03 per cent. With the act of 1816 the protective principle first appears prominent, the rates averaging from 1816-20, 22.53 per cent. From this time on to 1832 the protective principle was more and more adopted in successive acts, as those of 1824 and 1828. From 1821-26 the rate averaged 33.07 per cent., and from 1827-31, 40.21. In 1832 a reduction was made to remove the "abominations" of the act of 1828. In 1832 the rate averaged 30.86, and in 1833, 23.95 per cent. The growing influence of the South obtained still further reductions, and from 1834-43 the average was 17.18 per cent., ranging from 20.84 in 1838 to 15.45 in 1840. In 1842, however, protectionist measures slightly prevailed, yet from 1844-57 there was a steady tendency to enact lower rates, and the average during this period was 23.85. In 1857 still further reductions obtained, and the average from 1857-61 was 16.35, falling in 1861 to 14.21 per cent. In 1861, however, the Morell tariff act was passed, followed by still further enactment of "war tariffs," the average from 1862-65 being 31.21, rising from 26.09 to 38.46. After the war still higher protective rates prevailed, rising from 41.81 in 1866 to 46.49 in 1871, and averaging during this period 43.95. From 1871-91, under the dominance of the Republican Party in Congress, the rate averaged 29.70 per cent., ranging from 38.94 in 1871 to 25.25 in 1891.

In 1882 a tariff commission was appointed, resulting in little change. In 1890 the celebrated McKinley act was passed by the protectionists. In 1894, under a Democratic administration, the Wilson act was passed, yet it so slightly reduced the tariff, that President Cleveland, weakly allowing it to become a law, tried to avoid responsibility for it by declining to sign it. The only important change from the McKinley act was the admission of wool as free, while to please the Sugar Trust, a duty of 40 per cent. was placed on sugar and an additional duty on refined sugar. The ratio from 1890-96 inclusive averaged for the respective years 29.12, 25.25, 21.26, 23.49, 20.25, 20.67. All these rates, however, it must be remembered, were the percentages on dutiable and *free* articles. On dutiable articles alone the corresponding rates for the last seven years have been 44.41, 46.28, 48.71, 49.58, 50.06, 41.75, 40.18.

TARIFF COMMISSION IDEA.—The evil effects upon business and upon political parties of continual tariff changes (see **FREE TRADE**) are such that it has been proposed by some "to take the tariff out of politics" and regulate it by a commission. Senator Morgan, of Alabama, in 1894, introduced into Congress an amendment to the tariff bill to this effect. The commission was to consist of four persons appointed by the President and approved by the Senate. They were then to examine all duties and decide what articles were paying too high or too low duties, in order to raise the necessary revenue or to promote the general welfare; they were then to recommend the necessary changes to the President, and if he approved, he was to issue a proclamation making such changes. No changes were to exceed 25 per cent. of the present rates, and no article was to be changed twice in the same year.

The idea has been much discussed, usually favorably. Conventions have been held to favor it, but thus far the obstacles to a change have proved too great for action.

TAUSSIG, FRANK WILLIAM, was born in St. Louis, Mo., in 1859. He received from Harvard University the degrees of A.B. in 1879, Ph.D. in 1883, LL.B. in 1886. He studied in Europe one year, and has since been Professor of Political Economy in Harvard University. His main works are: *Tariff History of the United States* (1888, 2d ed. 1892); *The Silver Situation in the United States* (1892); *Wages and Capital* (1896); and various contributions to the *Quarterly Journal of Economics*.

TAXATION. (See also **REVENUE**; **FINANCE**; **FREE TRADE**; **PROTECTION**; **SINGLE TAX**).—We consider in this article: I. The History of Taxation; II. Taxation in the United States; III. The Theory of Taxation; IV. Tax Reform.

I. HISTORY OF TAXATION.

In this portion of our article we have largely, tho not wholly, followed Professor R. T. Ely's *Taxation in American States and Cities*.

GREEK AND ROMAN PERIOD.

In early times, and to an extent all through classic times, taxation was light. Ancient States received their main revenues from wars, the conduct of State colonies, and trading expeditions, the management of State mines, forests, lands, etc. Slaves did the most of the labor, and foreigners were compelled to pay for protection in money or heavy tribute. Officials were paid usually not by salaries but by fees, and hence were of small expense to the State. Boeckh (Book III., i.) divides the revenues of Athens into "duties arising partly from public domains, including the mines; partly from customs and excise, and some taxes upon industry and persons, which only extended to the aliens and slaves; fines, together with justice fees and the proceeds of confiscated property; tributes of the allied or subject States, and regular liturgies" (or payments for amusements for the people, etc., by the holders of the offices). Grote puts the annual expenditure of Athens in the age of Pericles at 1000 talents, which Professor Ely (*Taxation in American States and Cities*, p. 25) values at \$1,200,000.

Rome passed from a period of light taxes to a period of 120 years (163-43 B.C.), when successful wars relieved her from necessity for any taxes, and then to a period of heavy and increasing taxation. Cicero, in his *De Officiis* (45 B.C.) speaks of taxation as a thing to be avoided if possible, and adopted only in extreme necessity. In Japan and most Asiatic and despotic countries taxation consisted of a tax paid in service to the State and in tithes laid on the land, and in most countries farmed out, as in the later Roman Empire, to corrupt and merciless tithe collectors, as in Turkey to-day.

In the Middle Ages the concept of the State was that it belonged to the prince or sovereign. Public employees were private servants. Large domains were set apart for the support of the sovereign. The kings at first collected no taxes from the peasantry; the king, under the general feudal conception, was supposed to own all the land, and not to part from this ownership. But he subdivided it among his barons to rule over (not to own), and for that right they did homage—i.e., paid service to the king, usually by bringing to the king a contingent of troops in time of war. They in turn subdivided their lands among the lower gentry or knights, again only to rule over, not to own, and for this obtained homage or service from the knights. These finally gave to their serfs the land to live on and cultivate (not own), and for this received from the serfs a certain amount of service. In this way there were practically no taxes, but each paid to his feudal superior a certain amount of service; the other expenses of the king and greater barons being met out of conquest, or lands held directly as theirs to use. Such was the general feudal conception, modified, however, in a thousand ways by various local conditions, concessions, customs, and traditions. At a later period, however, especially when the countries grew more settled, the barons often preferred to stay and defend their own lands or carry on their own wars, and so,

Greek
and
Roman
Taxes.

instead of giving contingents of troops to the king, gave a commutation or money substitute. The kings preferred this, as it enabled them to hire standing mercenaries and be more independent of their barons. This money payment became a tax. The next step was, as the necessities of the king grew, to extend taxation to all classes. It was overlooked or ignored that the other classes were already paying their service to the barons, for him to pay to the king. The lower classes began to be compelled to pay their feudal superiors and the king also. Gradually then the barons began to claim the ownership of the land in fee simple, instead of in use for the king, and what they were paid in service and later in money, they kept as *rent*, and what the king collected was *tax*. (See LAND.) Taxation was usually a forced payment, and collected in various ways and levied on all sorts of articles and under most various pretexts. At first they were regarded as supplementary payments for special needs, and were often forced loans. They were often levied

The Jews. upon especial classes, particularly the Jews. The revenues from the Jews were divided into four classes: *reliefs*, or inheritance taxes, usually one third the estate; *escheats*, or forfeitures for crimes and offenses, real or imaginary, like slaughtering Christian children, clipping the coin, etc.; *fnues*, or what we call fees, and *tallages* or poll taxes, levied according to one's means. According to Gross's *The Exchequer of the Jews of England in the Middle Ages*, pp. 25-29, the entire revenue of the Crown in the Middle Ages was only about £65,000, and of this the annual average tallage was about £5000—the Jews thus paying considerably over one tenth of the revenue. Jews were forced to pay enormous sums for the privilege of being "protected"—that is, robbed by the sovereigns. Yet revenues from the public domains were considered the best sources of public income. Taxes, even as late as the latter half of the sixteenth century, are spoken of as undesirable by Bodin in his famous work, *De la République*. Braunschweig-Wölfenbüttel declared, in the old German Reichstag in 1653, that taxes were contrary to the nature of the State because one entered into civil society to protect one's property and not to have it taken away. Kings, too, raised revenue by the sale of all possible imaginary titles, concessions, patent rights, monopolies, etc. The German princes especially became weak by the sale of their rights to the opulent free cities. Under James I. of England the title of baron brought £10,000, that of earl £12,000. Richelieu in France abolished 100,000 offices which had been created mainly to be sold. It was the defenseless mainly that were directly taxed. The insurrection of Wat Tyler was occasioned by the imposition of a poll tax. Taxes were finally put on all imaginable things: There were hearth taxes, window taxes, carriage taxes, livery taxes.

The history of modern taxation is the history of the recognition and control of taxation by legislation. The earliest parliaments were called to vote taxes. The recognition of the principle of "no taxation without representation" is the development of representative gov-

ernment. English constitutionalism has been built on the granting of taxes. According to the Magna Charta, "No scutage (land tax, or commutation for feudal service) or aid shall be imposed on our realm save by the common council of our realm." John was allowed to reserve for himself only the three customary feudal "aids"—contributions in case of king's captivity, on the knighthood of the eldest son, and on the marriage of the eldest daughter. The financial needs of the sovereign compelled in 1294 the addition to the charter, called the statute, "*de tallagio non concedendo*," whereby it was agreed that no taxes should be levied by the king, save with the consent of knights, burgesses, and citizens in Parliament assembled. This, says Green, "completed the fabric of our representative constitution." Parliament has since then been necessary. The Declaration of Rights (1689) declared that "levying money for or to the use of the Crown, by pretense of prerogative, without grant of Parliament for longer time or in other manner than the same is or shall be granted, is illegal." This was followed by annual grants of supplies, instead of life grants as before, and annual renewals of the Mutiny Act, containing provisions for the pay and discipline of the army. Annual parliaments have since been necessary. Green calls this "the greatest constitutional change which our history has witnessed" (*Short History of the English People*, chap. ix.). That it was the violation of the principle of no taxation without representation which led to the American Revolution is well known.

Taxation in Great Britain to-day is of many kinds. Tho known as a free trade country (see FREE TRADE), millions of pounds of revenue are still raised from custom duties on wine, spirits, tobacco, and a few other articles. These are not protective duties, however, because a duty is also laid on the home produce, as of spirits. More income is raised from excise duties (see EXCISE), considerable income is raised from stamp and death duties, a growing proportion from an income tax, while a comparatively small amount of national taxation comes from a land tax. Local expenditures are mainly met by rates on house values.

On the Continent, speaking generally, local expenses are largely met by indirect taxes, such as the *octroi* or duties on commodities brought into a city for sale, national taxation being either direct or from a protective tariff. (See PROTECTION.) In Europe, generally various stamp duties are more common than in the United States. See also the separate countries for their sources of revenue in more detail.

II. TAXATION IN THE UNITED STATES

In the earlier day of the American colonies there was small need for taxes. England asked no assistance. Quit-rents satisfied the proprietors or the companies, who in turn gave partial protection; there were few officials and few public expenses. Wars had not developed. Forfeitures, fees, fines, and payments for land met all expenses. Land was usually granted for the

**Modern
Taxation.**

**Great
Britain.**

support of schools. From 1647-89 all the taxes of Rhode Island were about £600 sterling. Fines were collected on the violation of summary laws. Mary Stebbins, in Springfield, Mass., was fined 10s.

**Colonial
Period.**

in 1667 for wearing silks contrary to law, and Nathaniel Ely, in 1674, for selling beer not made according to law. A poll tax was levied at

various times by almost all the colonies. In Virginia it was long the only tax. Maryland had, before the Revolution, no other direct tax. Quit-rents were annual charges on land in the colonies under proprietary government. Lands in colonies not proprietary were divided among the members of the colonizing companies, according to the amount of stock held or for services rendered. In later settlements the apportionment was according to one's ratable property. Public officials were mainly supported by fees—ministers by christening, churching, and burying fees; clerks by fees for issuing court papers and making records; sheriffs by fees for making arrests and inflicting punishments, etc. Licenses and fines, for sale of liquors, for marriages, for lawyers and peddlers, brought in considerable revenues. Lotteries (*q.v.*) were common in the later days when expenses grew. Fines were placed—*e.g.*, in Virginia—on widows, in Maryland on bachelors over 25, in New York on wigs. Excise duties were laid in almost all if not all the colonies on the manufacture of liquor. Duties on exports and imports were irregularly laid. Tonnage duties were levied payable in powder and shot. The methods of collection of the most of the taxes were the same as later on. Largesses were common, as in 1644 New Haven began annual contributions for the support of poor scholars at Harvard College. It consisted of a peck of wheat or value of the same from all "whose hart is willing." In Maryland in 1650 an "equal assessment" was made on all those who would not contribute for the maimed, lame, and blind. Private citizens gave often to the State. In Philadelphia, the charter of 1701 gave no power to levy taxes. The act of 1712 established the right of the citizens to control taxation. The State of Pennsylvania did not levy the first direct tax till 1785. It was an annual tax of £76,945. The annual expenditure of the State Government was given by Mr. Wolcott, Secretary of the Treasury, as \$130,000. Taxation was a very grudgingly recognized right. The attempts of England to tax caused the Revolution. What State taxes there were were very varied. In 1795, Mr. Oliver Wolcott, Secretary of the Treasury, in reporting to Congress a plan for laying and collecting federal revenues, declared that the systems of taxation in the various States were "utterly discordant and irreconcilable in their original principles." Seven States had a uniform capitation tax. All except Delaware taxed land, but in some according to quantity, in others quality. Responsibility in some States attached to the State; in others to the counties or townships. The average annual expenditure of each of the 15 States was less than \$70,000, the total about \$1,000,000. The New England States taxed live stock and capital. The Southern States taxed slaves.

National taxation was attempted before the adoption of the Constitution of 1787, but Congress had no power. It could only assess the States. After much discussion this was finally changed, and the new

**National
Taxation.**

Constitution conveyed to the national Congress "power to collect taxes, duties, imposts, and excises, to pay the debts and provide for the common defense and general welfare of the United States," and to "borrow money on the credit of the United States." But this large grant was accompanied by decided restrictions. The first is that "all duties, imposts, and excises shall be uniform throughout the United States." The second, that "no capitation or other direct tax shall be laid, unless in proportion to the census or enumeration" elsewhere provided for. The third, that "no tax or duty shall be laid on articles exported from any State. No preference shall be given, by any regulation of commerce or revenue, to the ports of one State over those of another." On the other hand, it is provided that "no State shall, without the consent of the Congress, lay any imposts or duties on imports or exports except what may be absolutely necessary for executing its inspection laws; and the net produce of all duties and imposts laid by any State on imports or exports shall be for the use of the treasury of the United States; and all such laws shall be subject to the revision and control of Congress." The interpretations of the Supreme Court have determined (1) that Congress has no power to levy duties on exports under any circumstances; (2) that no State may tax the "instrumentalities" which the federal Government deems proper to create or employ for carrying out its purposes, such as property in the debt of the United States.

This interpretation of the Constitution has led to the present condition of affairs, whereby the national Government has raised its revenues almost exclusively by indirect taxation, and the States have levied almost all our direct taxes. This has meant that the national Government has had the most remunerative taxes and the States the most unpopular. It has meant, too, that during large portions of our history the national revenue has been largely in excess of national expenditures. Only in our earliest history in war time and very recently has the revenue been insufficient and resort made to direct taxation by the national Government. In 1796 Congress yielded to the pressure of financial necessities, and recommended a direct tax, and in 1798 one was laid on houses, slaves, and lands.

Again during the War of 1812 it was necessary to resort to direct taxation to carry on the Government. Here a new feature was introduced, inasmuch as the several States were permitted to assume as States the payment of their quota of the tax. Many States availed themselves of this privilege. Thus was avoided a collection of the taxes by the United States Government at different rates in all parts of the country, and with it the general unfavorable criticism of the system. When again in 1861 it became necessary to resort to direct taxation, the privilege of assuming the payment of the quota was embraced by all the loyal States.

The main national taxation, however, has been indirect taxation through the tariff and the excise duties. (For a history of the former, see **TARIFF**, and for statistics of revenue, see **FINANCE**; **INTERNAL REVENUE**.) For the first years of our national life, burdened with debt, the revenue was by no means excessive, in spite of the excise taxes enacted under Washington's administration; but in 1801 those excise taxes were repealed, and by 1806 President Jefferson announced to Congress that the tariff revenue would soon be more than sufficient to meet the constitutional wants of the Government, and proposed that the powers of Congress be enlarged to enable it to undertake a great system of internal improvements. The outbreak of the war with Great Britain postponed the appearance of a surplus revenue and forced the reenactment of excise taxes. But in 1829 General Jackson announced the reappearance of a surplus revenue, and in 1836 a law was passed to deposit the surplus revenue with the States in quarterly installments. These deposits were made and were used for education, etc., but the business depression of 1837 and the failure of the State banks compelled the treasurer to suspend the fourth payment, and he was supported in so doing by Congress. Owing to the Mexican War and bad financial management, there was no surplus before the war, but in 1860 a debt of \$61,140,496. The expenses of the war caused "the war tariff," excise taxes, and direct taxes, besides large loans, and for 20 years after there was no surplus. But by 1887 the policy of the funding of the debt, putting a large part of it out of reach for redemption at par, there came to be a large surplus, even tho most of the war taxes had been repealed. It had come to be a practical question in national taxation what to do with the surplus revenue. It has not remained so. The growth of the pension list, which has come to be among the heaviest expenses of the Government (see **REVENUE**), with heavy appropriations for internal improvements, etc., has recently more than exhausted the revenue. Nevertheless the question of surplus revenue and the general questions of national taxation have been much discussed. One school of thinkers would reduce the tariff. (See **FREE TRADE**.) Others claim that the recent insufficiency of revenue has been due to the repeal of the McKinley Act. (See **TARIFF**.) Free traders argue that the income under the Wilson Bill has exceeded that under the McKinley Act. Others favor a large extension of functions by the national Government. Still others favor the retention of a high tariff, but the repeal of excise duties on tobacco and alcohol used in the arts. (See **PROTECTION**. For present national taxes, see **FINANCE**, **INTERNAL REVENUE**. See also **INCOME TAX**.)

Coming to State taxation, we have seen that the systems of State taxation inherited from the colonies were most diverse and confusing. This diversity has largely continued.

They are all, as has been said, direct taxes. **State Taxes.** At first the general aim was to tax according to ability to pay. In Connecticut, till 1814, taxation was first upon property according to its probable net revenue. In Ohio, till 1825, land

was divided into three classes, according to quality, and there were three rates of taxation per 100 acres. In 1825 a clause was introduced providing that land should be taxed without taking into consideration the actual improvements thereon. In Maryland, there was a direct tax for local purposes on the direct value of all property. Other States followed in the main the systems of taxation inherited from the colonies. (See above.) Generally speaking, the effort to tax all property according to income proved a failure, and the tendency has prevailed to tax according to selling value, this change being made in most States in the forties. Another change, too, was generally made about the same time. The old specifications of property failed to reach large masses of wealth. The attempt now is to tax all property according to selling value. The Constitution of Ohio, adopted 1851, expressly provides that even State and local bonds shall be taxed. Nevertheless, this attempt to tax all property equitably according to its selling value has not succeeded. In many States the opulent pay taxes on little more than what property they choose to return. The widows, and the helpless, and the conscientious, whose property being in the hands of the courts, is easily measured or fully returned, pay full taxes. The rich who will largely escape taxation on personal property. In Ohio, where the most strenuous efforts have been made to reach all property, the Governor reported that "in 1883 the valuation for taxation of the personal property of the State, as shown by the grand duplicate, was \$542,207,121. In 1884, it shrank to \$528,298,871, and for 1885 dwindled again to \$509,913,986. This loss has been made up largely by the steady growth of the valuation of real estate on account of new structures, etc., but the loss was greater than the increase last year" (Professor Ely's *Taxation in American States and Cities*, p. 157). Says the preliminary report of the West Virginia Tax Commission, made in 1884:

"At present all the taxes from invisible property come from a few conspicuously conscientious citizens, from widows' executors, and from guardians of the insane and infants; in fact, it is a comparatively rare thing to find a shrewd trader who 'gives in' any considerable amount of notes, stocks, or money; the truth is, things have come to such a condition in West Virginia that, as regards paying taxes on this class of property, it is almost as voluntary and is considered pretty much in the same light as donations to the neighborhood church or Sunday-school. . . . The statistics bearing on this point will scarcely be credited by persons who have not investigated the subject" (*Ibid.*, p. 174).

In New York State the assessors, in their report for 1881 say:

"Women, heirs, executors, administrators, guardians, and trustees of persons of unsound mind are assessed beyond all measure of justice. . . . The same assessor, however, if not forgetting his oath when inquiring of the wealthy neighbor as to his personal, very likely accepts the negative answer as truthful, tho it is well known to the community that he possesses large means. The one has not yet learned how to cover the personal property by an assumed indebtedness, while the other is well versed in the many devices by which he may escape even the 'diligent' assessor" (*Ibid.*, p. 174).

The most careful study, however, of the present condition of city taxation in the United States is the Eighth Biennial Report (1894) of

the Illinois Bureau of Labor Statistics, of which George A. Schilling is secretary. It is an *exposé* of the crookedness and inequalities of the present system of assessing and levying taxes, and of the extent to which wealthy individuals and corporations escape taxation. Applying to Chicago, it is notoriously representative to a greater or less degree of all our larger and some of our smaller cities. Its value may be seen in the fact that the original edition of 45,000 was exhausted in a few months, and a special edi-

tion called for. The report considers the whole subject at length. We can quote from it only some of its findings as to the assessment and taxation of personal and land property. It shows, in the first place, the extent to which personal property escapes taxation. The following table shows the amount of personal property assessed in Cook County (the city of Chicago) and outside of Chicago, and also the relative property of bankers which is assessed and that of other classes of citizens :

ASSESSED PERSONAL PROPERTY OF BANKERS, BROKERS, ETC., AND OF OTHER CLASSES.*

AREA.	Population by United States Census, 1890.	ASSESSED MONEY.		AMOUNT PER CAPITA.	
		Bankers, etc.	Other Persons.	Bankers, etc.	Other Persons.
Illinois.....	3,826,351	\$3,120,555	\$7,769,358	\$0.816	\$2.03
Cook County.....	1,191,922	43,925	434,244	0.037	0.364
Other counties.....	2,634,429	3,076,630	7,335,114	1.168	2.784

ASSESSED CREDITS.*

AREA.	ASSESSED CREDITS.		AMOUNT PER CAPITA.	
	Bankers, etc.	Other Persons.	Bankers, etc.	Other Persons.
Illinois.....	\$1,563,583	\$11,343,365	\$0.409	\$2.968
Cook County.....	10,000	522,110	0.008	0.438
Other counties.....	1,553,583	10,821,255	0.590	0.108

* Tabulated from *Eighth Biennial Report of Illinois Bureau of Labor.*

As further illustrative of the undervaluations in Cook County, tables are presented which show that, according to the report of the State auditor, the net taxable credits and moneys of 27 State banks in Chicago, on June 5, 1893, amounted to \$1,058,105.25 and \$18,991,771.67, respectively, while the amounts of these items listed for taxation, May 1, 1894, by all the banks in the city (national banks excluded) amounted to \$10,000 and \$4,925 respectively.

Of the utterly unjust assessments of real estate, the report gives equally plain evidence.

The extent of the undervaluation for the purpose of taxation is first illustrated by a series of tables, that compare the cost of buildings erected during a number of years, as shown by the building permits, with the assessed value of all real estate. The following statement summarizes the general results of the comparison :

COST OF BUILDINGS AND ASSESSED VALUE OF ALL REAL ESTATE IN CHICAGO.

Buildings erected, 1876 to 1893.....	63,301
Cost.....	\$48,144,603
Average cost.....	\$6,605.66
Per cent. of total cost.....	100.00
Assessors' valuation, all real estate, 1893..	\$123,745,832
Per cent. of cost of buildings.....	29.59
Cost of buildings erected, 1890, 1891, and 1892.....	\$129,364,250
Per cent. of assessed value of all real estate, 1893.....	104.54

Leaving out entirely the buildings erected prior to 1876 and still standing in 1893, and

omitting land values altogether, the assessment valuation in 1893 of both land and improvements was less than one third of the cost of the buildings for which permits were granted after the close of 1875.

A description is given of 70 of the costliest commercial buildings of the city, with the true and the assessed value of the land and the buildings separately shown, and the percentages of the assessed to the true values ; similar showings are also made for a number of costly and a number of cheap residences. The increase in the true value of some of the commercial and costly residence property is compared with the decrease in the assessment value. Comment is also made on the constantly increasing value of land and decreasing value of improvements, with almost stationary assessment values.

In comparing values for old and new style office buildings, it is found that while in both cases the site value exceeds the value of the buildings, the proportion is much greater in the case of the old buildings. For 44 new buildings the site value was 50.84 per cent. of the value of both land and buildings, while for 16 old buildings it was 74.23 per cent. In the case of eight lots in a choice residence portion of the city the value of the ground is shown to have increased 556.59 per cent. between 1882 and 1893, while the assessed valuation increased 76.55 per cent., and the per cent. that the as-

essed is of the true value decreased from 21.72 in 1882 to 5.84 in 1893. The assessed value of the improvements on these lots in 1893 was 15.82 per cent. of the true value. For 98 unimproved lots the assessment for 1893 was 4.88 per cent. of the true value, while for 20 buildings it was 13.54 per cent. The variation between the percentage of true value at which buildings are assessed and that at which building sites are assessed appears to be about the same for all classes of property.

Apart from its obvious tendency to obstruct improvement, the report states that "a custom of assessment for taxation like that above described must therefore in its very nature discriminate against the owners of improved property according to the greater value of their improvements relatively to the value of their land. And this operates with special force against owners of cheaper properties." Comparing a business property valued at \$800,000 with a residence valued at \$8875, it is shown that for the business property the ground was 87.50 per cent., and the building 12.50 per cent. of the total value, and for the residence the

ground was 21.13 per cent and the building 78.87 per cent. The assessed value of the land in the case of the business property was 7.29 per cent, the building 27 per cent., and the total 9.75 per cent. of the true value. For the residence property the percentages were, land 5.33 per cent., building 15.71 per cent., and total 13.52 per cent. of the true value. In these two cases the assessment valuation is, in proportion to actual value, lower on the cheaper property both as to site and improvement, than on the business property; and yet the total assessment valuation of the cheaper property is 3.77 per cent. greater, as compared with the total real value, than the total assessment of the business property.

A number of tables are presented which show the quantity and assessed value of real and personal property, also of railroad and other corporate property throughout the entire State of Illinois, with appropriate comparisons with similar values for the State of Indiana. These statistics are shown in detail by county totals, comparisons being made between the totals of 1873 and 1893. The two final summary tables are in substance as follows:

ASSESSED VALUATION, ALL CLASSES OF PROPERTY, ILLINOIS.

CLASS OF PROPERTY.	ASSESSED VALUES IN		Decrease.	Per cent. of Decrease.
	1873.	1893.		
Personal property.....	\$287,292,809	\$145,318,406	\$141,974,403	49.42
Lands.....	582,416,667	320,964,855	261,451,812	44.89
Town and city lots.....	317,199,285	293,274,185	23,925,100	7.54
Railroads (all property).....	133,807,823	82,270,090	51,537,733	38.52
Corporations other than railroads.....	20,896,462	5,363,979	15,532,483	74.33
The city of Quincy.....	13,788,271	*	13,788,271
Total.....	\$1,355,401,317	\$847,191,515	\$508,209,802	37.50

* Assessment of the city of Quincy included in Adams County.

The report gives many concrete examples of the way real estate is undervalued, and so escapes taxation. Of 30 residences ranging in value from \$20,000 to \$1,300,000, the report says:

"The highest assessment shown is only 12.23 per cent. of true value. That is the assessment valuation of the residence, No. 112 Lake Shore Drive, worth \$120,000. The residence, Nos. 87-102 Lake Shore Drive, worth \$1,300,000, is assessed at only 5.54 per cent. of true value; its millionaire owner pays considerably less than half the tax for his home, in proportion to value, that is paid by the owner of the \$120,000 home. The owner of the least valuable home in all the list, the residence at No. 2829 Indiana Avenue, pays on a 9.5 per cent. valuation—nearly double the proportion paid on the millionaire residence; and homes worth but little more than the minimum limit of the list—those at Nos. 2241 and 2243 Michigan Avenue—are taxed upon 11.03 per cent. of true value; or proportionately within a very small fraction of double the tax upon the millionaire home. Some of the comparatively modest places are taxed at a low valuation. One worth \$50,000 is taxed upon only 4.86 per cent. of its value; one worth \$67,500 is not much worse off with a tax upon 6.30 per cent. of its value; one worth \$60,000 is assessed at 4.08 per cent. of its value, and one worth \$20,000 is assessed as low as at 4 per cent. of its value. The average valuation of the 30 properties is but 7.78 per cent. of real value.

"How can the fraudulent character of these valuations be doubted? Make all possible allowance for differences of opinion, and still assessors cannot ex-

plain the valuation of \$50,000 property at \$2430; of \$90,000 property at \$3600; of \$175,000 property at \$7980; of \$1,300,000 property at \$71,960, and so on. And what explanation can the owners make? They may say it is no part of their business to object to undervaluations of their property; but they would not try to satisfy a merchant with such an explanation of purchases from his clerks at prices so monstrously out of proportion to real value. Why is their standard of honor and honesty so radically different when the issue is with the people instead of a merchant? and over a question of shirking taxes instead of purloining goods? This question is the dilemma of those owners who passively acquiesce in undervaluations; those who actively promote them have a worse moral problem to deal with."

As an illustration of the way vacant land is undervalued, the report gives the following history of a bit of land formerly known as the Garfield Race Track, owned by Judge Lambert Tree:

"It is unimproved, held for a rise, an eyesore and obstruction to the growing neighborhood, and worth at the present time not less than \$1,000,000. This property was patented in 1835; in 1836 it was sold for \$580; in 1870 it was sold again, the price being now \$50,000. At the next sale, in 1875, the true price was veiled—\$1000 and 'other good and valuable property' being the consideration expressed. In 1870, the year the property sold for \$50,000, it was valued by the assessor at \$39,960, and by the Board of Equalization at \$37,562, and taxed \$8245.50. Since that time the valuation has

been slightly increased and the tax slightly reduced, as follows :

YEAR.	Assessors' Valuation.	Board's Valuation.	Taxes.
1870.....	\$39,960	\$375,562	\$8,245.50
1880.....	49,530	49,942	2,430.75
1890.....	101,200	19,416	7,737.05
1893.....	88,600	106,320	7,768.59

"It will be observed that the highest valuation—that of 1890—is but little more than double the price paid in 1870, long before the thick population that now surrounds the property had begun to drift in that direction. The valuation for 1893 does not exceed 10 per cent. of the true value."

For further facts as to city taxes, see CITIES.

III. THE THEORY OF TAXATION.

The theory of taxation may be considered under three heads : (1) the canons of taxation ; (2) its incidence ; (3) particular taxes. The canons of taxation—*i. e.*, the characteristics by which taxes are to be measured as wise or unwise, are usually based on the four classic canons laid down by Adam Smith. They are in Smith's words as follows :

"1. The subjects of every State ought to contribute to the support of the Government as nearly as possible in proportion to their respective abilities : that is, in proportion to the revenue which they respectively enjoy under the protection of the State. In the observation or neglect of this maxim consists what is called the equality or inequality of taxation.

"2. The tax which each individual is bound to pay ought to be certain, and not arbitrary. The time of payment, the manner of payment, the quantity to be paid, ought all to be clear and plain to the contributor and to every other person. Where it is otherwise, every person subject to the tax is put more or less in the power of the tax-gatherer, who can either aggravate the tax upon any obnoxious contributor, or exert, by the terror of such aggravation, some present or perquisite to himself. The uncertainty of taxation encourages the insolence and favors the corruption of an order of men who are naturally unpopular, even when they are neither insolent nor corrupt. The

Canons of Taxation.

certainty of what each individual ought to pay is, in taxation, a matter of so great importance, that a very considerable degree of inequality, it appears, I believe, from the experience of all nations, is not near so great an evil as a very small degree of uncertainty.

"3. Every tax ought to be levied at the time or in the manner in which it is most likely to be convenient for the contributor to pay it. A tax upon the rent of land or of houses, payable at the same term at which such rents are usually paid, is levied at a time when it is most likely to be convenient for the contributor to pay, or when he is most likely to have wherewithal to pay. Taxes upon such consumable goods as are articles of luxury are all finally paid by the consumer, and generally in a manner that is very convenient to him. He pays them by little and little, as he has occasion to buy the goods. As he is at liberty, too, either to buy or not to buy, as he pleases, it must be his own fault if he ever suffers any considerable inconvenience from such taxes.

"4. Every tax ought to be so contrived as both to take out and to keep out of the pockets of the people as little as possible over and above what it brings into the public treasury of the State."

Other canons of taxation are sometimes added, as, for example, the following, laid down in the *Encyclopædia Britannica* :

"(a) A given amount of revenue is, as a rule, both from the point of view of the Government and its subjects more conveniently raised from a small number of very productive taxes than from a larger number with smaller returns per unit. (b) A good system of

taxation ought to provide for a self-acting increase in the revenue in proportion as the population and the consequent demands for governmental expenditure increase. It has been found by experience that an old tax causes less inconvenience than a new tax of smaller amount, a fact which is so striking in some cases as to have given rise to the saying that an old tax is no tax. (c) Those taxes are best which yield a steady and calculable return, instead of a return fluctuating in character and difficult to estimate. (d) Those taxes are best which in case of need can be most conveniently increased in amount. (e) Regard must always be paid to the real incidence of taxation, and care taken that the real burden of the tax falls on those aimed at by the Legislature."

The subject of the incidence of taxation is one of the most involved and debated in economic science. Professor Seligman, in his *The Shifting and Incidence of Taxation*, traces the history of the doctrine of incidence, and finds nine different theories besides those which he

Theory of Incidence.

calls early theories. The early theories he divides into those favoring a general excise tax (Hobbes, Cradock, Munn, Petty), those that favored a single tax on land (Locke, Davenant, Cantillon, and others), those that favored a more elastic system (Hume and Steuart). The first developed theory which he considers is that of the physiocrats (*q. v.*). They held that as land is the only original source of wealth, all taxes should be on land alone, and then cannot be shifted, while any other tax will be shifted. The absolute theory, he says, was outlined by Smith and perfected by Ricardo. According to this, a tax on pure rent will remain on land. Other land taxes and all special taxes on commodities not included in the laborer's standard of life will be shifted on to the consumer. All general taxes on agricultural produce, on wages, or on profits come from the capitalist. These conclusions are derived from the Ricardian doctrine of rents, wages, and the residuum of profits. The equal diffusion or optimistic theory, that all taxes are generally diffused on consumers, Professor Seligman criticises severely, tho he finds it accepted widely, especially in America. The germs of it he finds in the Italian economist Verri, and especially in Canard. It is accepted by Thiers, Courcelle-Seneuil, Cherbuliez, Prittwitz, Stein America, however, Professor Seligman says, is "the only country in the world where the doctrine is still upheld," and the chief representative of this easy-going, complacent doctrine is David A. Wells." The pessimistic theory, held by Proudhon, also believes that all taxes fall on the consumer, and that this cannot be helped in any form of taxation. The capitalization or amortization theory argues that the land tax falls exclusively on the landowner, and that hence the taxation of land is simply equivalent to depreciating the value of the land by the capitalized value of the tax. From this is deduced the conclusion that after the tax is once imposed it makes no difference how much the tax is, provided it be constant, since whatever it is, its capitalization has been subtracted once for all from the value of the land. The germ of this theory Professor Seligman finds in John Craig. German writers like Sartorius, Hoffman, and Murhard, went so far as to say that a land tax was no tax at all ; this has been to some extent accepted by modern econ-

omists like Garnier, Wolowski, Cherbuliez, Walras, Leroy-Beaulieu. Rau discusses the theory, and shows that it is only true so far as the value of land depends on its net produce, and this only so far as the produce does not change, and this is true not only of land, but of any commodities of varying value capable of sale. Under the head of the eclectic theory, Professor Seligman groups those who criticise all the above theories, among them J. B. Say, Sismondi, Garnier, Parieu, Von Thünen, Von Hock, Rau, Prince-Smith, Jones, Senior, Mill, McCulloch, Cliffe-Leslie. All these deny that any of the above theories work without exception. The negative or agnostic theory of Held goes farther and denies the above theories. Held argues that all profits like land profits depend on the difference between the greatest cost and market price. The socialist theory Professor Seligman calls Lassalle's teaching, that indirect taxes are all those not assessed on income or property, and fall on the laborer, who, even in Germany, has not been quite squeezed down to starvation. The last theory which Professor Seligman considers is the quantitative or mathematical theory, as developed by Cournot, Jenkin, and Pantaleoni. The treatise of the last named Professor Seligman considers the best existing treatment of incidence. This theory is, however, a method rather than a theory. It regards incidence as bound up with the theory of value (*q.v.*).

With such contradictory views as to the general theory of incidence, it is wiser to discuss concrete taxes than any general principles.

Taxes are usually divided into direct and indirect. Taxes are called direct taxes when the payment is made by the person taxed.

A direct tax is defined by Mill as one "demanded from the very persons who it is intended or desired should pay it." Others (*e.g.*, McCulloch) define it as a tax taken directly from income or capital. In the former definition non-transferable taxes on expenditure would be included (*e.g.*, a tax on livery servants), but not in the latter. Mill's definition has been generally adopted; but a tax which is usually direct may sometimes become indirect, and, as we have seen, it is often impossible to say what is really the incidence of a tax.

Indirect taxes are paid, in the first place, by merchants and tradesmen, but it is understood that they recover the amount paid from their customers. The principal taxes consist of the customs duties levied upon articles, when they are imported for use in this country, and excise duties, or duties levied upon goods produced within a country.

The main direct taxes may be divided into taxes on income and taxes on expenditure. Taxes on income may be divided into taxes on rent, on profits, on wages, on bequest or inheritance. Taxes on expenditure are mainly indirect, but may be direct, as a window tax, a water tax, a house tax, if levied on the user of the window, water, or house. These various taxes with their incidence we must now consider. The question of the wisdom of direct or indirect taxes has been much discussed, tho it has usually been involved with the question of free trade or protection, and is discussed under these heads.

The form of direct tax most approved is undoubtedly land taxation. The subject of the incidence of land taxation is so important that we quote at length on the subject from Professor Seligman. He says:

"Theoretically there may be five kinds of land taxes:

- "1. Tax on economic rent.
- "2. Tax on profits from agriculture.
- "3. Tax according to net produce.
- "4. Tax according to quantity.
- "5. Tax according to selling value.

"A tax on economic rent can never be shifted. Here all writers are agreed. As regards the other taxes, Ricardo maintained that a tax on the value of land or on produce will raise prices and fall on the consumer. Ricardo's theory would hold good on two conditions: First, that there was an absolute mobility of capital and labor; and, secondly, that the community in question was an isolated one. It is assumed that the farmers will abandon the land rather than cultivate it at a loss, and that a decrease of supply will raise price. Now it may happen that an increase of price will often lead to a decrease of consumption, which again will react on the price, so that at best only a part and not the whole of the tax would be shifted to the consumer. But in actual life it is a difficult matter for producers to decrease the supply of agricultural products. The tax would often simply have the influence of reducing the farmer's profits.

"In the case of cities we may have four cases:

- "1. When the tax is levied on the ground-owner the case is simple. The value of a lot is fixed by the law of monopoly value. Its price will be entirely unaffected by the imposition of a tax.
- "2. The tax may be levied on the house-owner apart from the question whether or not he is the land-owner. Buildings represent the investment of capital and labor. A special tax imposed on the building-owner can therefore generally be shifted.

City Real Estate.

"A distinction must, however, be drawn between houses already constructed and those built after the tax is imposed. In exceptional cases the tax imposed on old houses cannot be shifted.

- "3. The tax is levied on the ground-owner, who is at the same time the house-owner. We need here only combine the two preceding cases.

- "4. The tax is assessed on the occupier according to rental value. It is generally supposed that the ground rent part of the tax will be shifted to the ground-owner. But this is not always true, for three reasons: 1. The ground rent may be so low and the rent so high that the builders cannot afford to erect any more houses. This means an increase of the rents. 2. In the course of long leases any intervening increase must rest on the occupier. He cannot improve his condition until the expiration of the lease. 3. But even in the case of short leases, it is not true that the tax can always be shifted. If the competition for lodgings be such that the rent is \$200, the occupier who has been paying \$10 as the ground tax proportion of the whole tax will not pay any less rent for the premises if his tax is increased to \$15. It might, indeed, cause the tenant to live in a less desirable locality—*i.e.*, lower his standard of life. The occupier could evade the tax, but he could not shift it."

Taxes on other property than land obey still more complicated laws of incidence. Taxes on luxury cannot be shifted, but they are expensive in collection, depend mainly on the conscientious reporting by citizens of their own wealth, with the result that they fall only on a few conscientious citizens, and produce a great deal of dishonesty, with a very small profit for the State.

Taxes on income, on inheritance, are of very great importance, but of such importance that we consider them under especial articles. It is generally held that taxes on capital, on investments, etc., can be shifted. If all capital were mobile, its taxation could undoubtedly be shifted; but for various reasons, such as the condition of the market, expense of the pro-

cess, all capital cannot be moved, and then the tax cannot always be shifted. Taxes on railroads, street-car corporations, etc., so far as they are not taxes on land values, can theoretically be shifted on to the people who patronize the cars, etc.; but practically they often cannot, as the rates are sometimes fixed by law, more often by a custom, which the companies cannot break.

Taxes on Capital.

A few other taxes may be briefly considered. Poll taxes, once common, are now rare. They fall unjustly, because they tax the poor man and the wealthy man equally; they bring too little revenue at large expense. In England, they have not been levied since William III. Stamp duties are generally considered more cumbersome than effective, tho in England and Europe generally they are still common. They are usually indirect taxes. The question of taxation is more and more being limited to a discussion which is wiser of two or three great classes of taxes.

IV. TAX REFORM.

(For the position and arguments of the advocates of particular tax reforms, see INCOME TAX; INHERITANCE TAX; SINGLE TAX. For the arguments for and against duties for protection, see PROTECTION; FREE TRADE.) Generally speaking, other propositions to reform taxation may be divided into the two great classes of those who would concentrate taxation upon land and those who, in various ways, would seek to tax all personal property. As representative of the former class, we quote a short paper read by Professor S. M. Dick, before the American Economic Association, August 24, 1892. He says:

"All writers and teachers dealing with the subject of taxation, so far as I know, are agreed that the American taxing system is faulty and ought to be reformed.

"Some of its worst defects are: It puts a premium on dishonesty; it is exceedingly complex; it tends to widen the breach already existing in society. There are two reasons why a reform is difficult to inaugurate: First, the rich men do not want it. Second, the farmers do not want it.

"Our present system is the system of 100 years ago. At that time millionaires and monopolies were unknown to America. Our system was more nearly just than that it is possible for it to be now. Since new factors of wealth have been introduced, new methods of taxation are necessary.

Land Taxation.

"In 1826 the personal property in Ohio was nearly equal in value to the real estate. In 1839 the realty amounted to \$1,213,645,052, while the personal property is listed at only \$549,552,292. Assuming that the personal property is worth as much as the real, we have \$673,092,760 of taxable personal property bearing no portion of the public burden. In the city of Cincinnati in 1867 the personal property was valued at \$68,412,285, and the real at \$68,596,049, while in 1880 the real was valued at \$129,956,980, and the personal at only \$37,578,376. This apparent decrease of personal property is not limited to Cincinnati. The same is true in other large cities in Ohio. Personal property, therefore, escapes taxation. The most logical basis for a system of local taxation is real estate. The taxation of mortgages is a question of great interest to the people of the United States, since the census of 1890 shows that there are 12,600,152 families and 9,000,000 of mortgages in the United States. Mortgages, so far, have not been successfully taxed.

"If taxation were on real estate alone in Ohio, those counties most given to farming would save, per annum, from 15 to 20 per cent. of all the tax now paid for State purposes.

"Had real estate alone been taxed in 1891, and had the same amount of tax been required for State purposes that was demanded, the four counties containing the four largest cities in Ohio would have paid \$147,889.30 more than they did pay. The four cities would have paid much more than this, and the farm hands in those counties would have saved a large per cent. of their tax.

"It is very evident from the facts ascertained in the investigation that Ohio farmers would be largely the gainers if personal property were exempt from taxation."

The above paper is not, however, to be understood to commit Professor Dick or his fellow-thinkers to a sole tax on real estate. It was shown in the debate that followed that the professor would not limit taxation to this. On this point Professor Seligman said (and Professor Dick agreed with him):

"The thought is perhaps in harmony with that of a large number of tax reformers in this country, that the best basis, or at least a very good basis for local taxation would be real property. Henry George goes one step farther, and maintains that the basis should be land exclusive of improvements. My objection is that while the plan has many advantages of ease and convenience of collection, and of non-inducement to fraud, it fails of equality and uniformity. There is no doubt that after all the contests over principles of taxation, modern science has settled down on a taxation according to ability and means rather than on a taxation according to benefits, tho it is true that in local taxation this principle must be modified somewhat by the principle of benefits to the individual and his property. As real property has a large share of the benefits of State and municipal protection, it ought to bear a large share of the taxation. It is hopeless to suppose that the farmers of this country will ever consent to abolish the tax on personal property unless we replace it by something which will reach the bondholders, and tax the holders of millions who did not get their wealth from real estate. No system of local taxation can be worked out without taking into account the general State and national taxation system, all three systems trying to get at the faculty of the individual."

This general proposition to concentrate taxation on land is the one supported by the report of the Illinois Bureau of Labor, quoted above. It says:

"To adopt the site-value method of taxation is to invite general prosperity. With personal property exempt, its increased consumption would increase the demand for it, and consequently multiply business opportunities in connection with making, carrying, and selling it. With landed improvements also exempt, larger and better homes would be demanded, to the stimulation of all branches of the building industry. With vacant lots taxed the same as if improved, and so much that it would be unprofitable to hold them long out of use, speculative values would decline and business be no longer obstructed by exorbitant prices for location.

"Working men would pay in taxes only what their ground-rent privileges were worth. Farmers would pay in taxes not more than their farms would rent for if wholly denuded of buildings, fences, and drains, and turned back into raw prairie. Every one would be benefited through reduced taxes, or better incomes, or both—every one except the mere monopolizer of public benefits.

"And the cry of fraudulent taxation, on any other account than an occasional personal dereliction, like a post-office embezzlement or a bank robbery, would be heard no more.

"Simple, practicable, natural, scientific, and just as the site-value tax doubtless is as a method of raising public revenues, it is at the same time recommended by its supporters as the solution of the labor question, or, more correctly, as the natural way of reinvesting every laborer with power to settle his own labor question for himself. For it is not the power of employers, but the necessities of the unemployed or the inadequately employed that makes employment precarious and wages low. It is not the clubs of policemen nor the weapons of soldiers that defeat strikes; it is the underbidding of men in worse plight than the strikers. The simple remedy is by freeing business from mo-

nopoly and tax burdens to open the way for unlimited opportunities for employment, so that none need take another's place in order to get remunerative work himself. This, it is claimed, the site-value tax would do."

As an example of those who strive to tax personal property more rigorously we quote the Hon. Mr. Winn, in an address made in Faneuil Hall, Boston, October 7, 1891. He said :

"When personal property is all taxed, the owner of a house cannot collect the tax on it from his tenant by making him pay more rent. He must bear his own taxes.

"But, when personal property is permitted to escape, the landlord can make his tenant bear the tax on the house by charging that much more rent.

The reason is that, if capital in buildings escapes taxation by throwing the tax on the tenant, capital outside, if taxed, will flow into buildings to get the same advantage, till it can be got no more.

"But if the outside capital is not taxed it will not flow into buildings, which always are taxed, until the tenants are willing by a higher rent to bear the new tax the capital has to assume.

"This is the very key to the situation. Here is the method by which the rich throw their taxes over on to the poor, who are not in the tax lists at all. They get chattels exempted, or take care

Taxation of Capital.

that the laws are lax enough to permit their escape from taxation. And by this the poor men who have no property whatever, but who must have shelter, and who never dream they are paying taxes, are haled in to bear not only the taxes of the tax-dodging millionaire, but those of their landlords as well.

"Data have been collected which show that the rent of the poor whose incomes are less than \$1000 is four times as great according to their means as the rent borne by persons whose incomes exceed \$7500. So a tax on rent, if borne by tenants, is grossly disproportionate.

"Come at it from another direction. The report of the tax committee of the Boston Executive Business Association, written by one who desires to exempt this class of property, and who would naturally underestimate its amount, declares:

"The personal property of both city and State, which under the law is subject to taxation, cannot be less than twice the value of the real estate."

"If this is so, more than 2,000,000,000 escapes taxation, and the people are cheated out of about \$17,000,000 of taxes per annum. I understand that Mr. Robert Giffen estimates the wealth of England to be about one sixth in land. Applying this scale to Massachusetts, and somewhat less than 1,700,000,000 escapes taxation, and the loss of taxes is \$14,000,000 to \$15,000,000. . . .

"I believe that the whole assessment of estates should be in the hands of the Tax Commissioner, who should appoint the local assessors, and that they should be paid by the State. I believe that the tax on private personal property should be an excise—a State tax at a uniform rate through the commonwealth—which should be the average tax rate as now laid on corporations. I believe that the personal property tax collected should be distributed to the cities and towns in proportion to the value of their real estate, with such concession as may be reasonable to places of taxpayers' residence. Or that the State should help the municipalities with the proceeds in the support of schools and roads and such other expenses as the State may wisely assume. I believe that every taxpayer should be compelled to give in a sworn list of his personal property under penalty of double doomsday at least. And if this is not enough we may adopt the Swiss system of examining the estates in probate."

TELEGRAPH, THE.—In the progress from the lowest life to the highest, one of the most marked advances consists in the development of a nervous system capable of carrying

swift and accurate intelligence from one part of the organism to another. In the social organism the nervous system, or system of communicating intelligence, has reached its present high development largely by means of the telegraph.

An organism should own and control its nervous system, and a society should own and control its telegraphic system. France, Germany, Switzerland, Denmark, Sweden, Norway, and many other nations early recognized this truth, and built public telegraph lines at the start. England, Belgium, New Zealand, and a few other States tried private control, but found it so objectionable that they changed to public ownership and control of the nerves of the body politic, so that now, out of 75 of the chief nations of the world from which statistics have been obtained, **England.**

there are but six that do not own and operate their telegraphs—*viz.*, Cuba, Cyprus, Bolivia, Hawaii, Honduras, and the United States. In England the telegraph was in private hands for more than a quarter of a century; but complaints of high charges, inefficient service, unjust discrimination, etc., became so frequent and so urgent that at last the Government appointed a committee to investigate the public systems of Europe. The report made an exhaustive comparison of the public system in use on the Continent with the private system of England, and the result was so overwhelmingly in favor of the former, that the Government, under the leadership of Gladstone, yielded to the demands of the reformers, headed by the Edinburgh Chamber of Commerce, and passed a law (July 31, 1868) providing for the purchase of the lines, the rapid extension of the service into the rural districts, which had been neglected by the private companies, and the union of the telegraph with the postal department. The charges were at once reduced from one third to one half, and the business doubled in about two years. Complaints were no longer heard as before the transfer, and now, after more than a quarter of a century, the public system is unanimously pronounced a success. The Government has raised the wages of employees from time to time, lowered rates, extended the lines, and improved the facilities. The system has paid all operating expenses and cost of extension and improvements, but the surplus beyond these items has not been quite sufficient to cover interest on the tremendous original outlay, which was about four times the real value of the lines. Most of the nations of Europe make a profit on their telegraphs, although their rates are much lower than ours.

In the United States, the first telegraph line was built by the Government. It ran from Washington to Baltimore, and was placed in charge of the postal department. It was not at once a financial success, and Congress yielded to the persuasions of those who wished to buy the telegraph for a private institution. Even at first a few clear-sighted statesmen saw into the future far enough to discern the vast importance of the new idea and the greatness of the mistake that was being made. As early as 1844 Henry Clay was advo-

United States.

ating Government ownership of the telegraph. He wrote :

"It is quite manifest it is destined to exert great influence on the business affairs of society. In the hands of private individuals they will be able to monopolize intelligence and perform the greatest operations in commerce and other departments of business. I think such an engine should be exclusively under the control of the Government."

Many able statesmen have taken the view that public ownership is not only wise and expedient, but the plain duty of Congress under the provisions of the Constitution. The Constitution makes it the duty of Congress to establish public agencies for the transmission of intelligence, and it is bound to see that the best known means of performing that work are used in the people's service.

Down to the present time (September, 1896) 19 Congressional reports have been made upon the telegraph, 17 of them favorable to a postal system. The people in general are strongly in favor of a public telegraph. Over 2,000,000 of voters have signed petitions for it, several parties have demanded it in their platforms, four State legislatures, several city governments, the Farmers' Alliance, the Federation of Labor, the National Board of Trade, and other representative bodies have urged upon Congress the importance of a national telegraph, but so far without effect. From Henry Clay and Postmaster-General Cave Johnson to Senator Edmunds and Postmaster-General Wanamaker eminent men have striven for this reform to no avail ; the companies have more influence in

Congress apparently than the people and the statesmen have. It is thought by some that the books of distributed among Congressmen have much to do with their reluctance to do anything to injure the business of the donor company, or

Arguments for National Ownership.

take any step toward establishing a system under which they would have to pay for their own telegraphing.

Some of the reasons for desiring public ownership of the telegraph are as follows :

1. It would obviate the necessity of paying dividends on watered stock, or, indeed, on any stock.
2. It would take away a part of the material used in stock speculation and constitute a step toward abolishing gambling in stocks.
3. It would extend the telegraph into country districts.
4. It would produce an absolute saving of rent, light, fuel, labor, etc., by union of the telegraph with the postal system.
5. It would cause a considerable reduction of rates, bringing the lines within reach of the common people and greatly increasing the utility of the telegraph to the social and business life of the nation.
6. It would prevent discrimination in rates and service.
7. It would benefit employees, giving them shorter hours, higher wages, greater security of employment, liberty of petition, and entire freedom of organization.
8. It would prevent strikes.

9. It would be an element of strength in time of war.

10. It would abolish one of the giant private monopolies that are taxing the people without representation, and for private purposes ; that are manufacturing millionaires by the ton ; that are corrupting our politics and debasing our Government ; that are restraining the freedom of the press and the liberty of speech in pulpit and university hall ; that are creating and sustaining innumerable tributary trusts, syndicates, and monopolies for private aggrandizement ; that lock up inventions and withhold progress till their pockets give the word to march ; that place money above manhood, pervert the ideals of youth, and antagonize in every way the highest interests of humanity.

Objections to a public telegraph have come almost wholly from the companies and a few persons who sympathize with their methods and purposes or who entertain a fundamental distrust of popular government along the whole line, and would not have even a public post-office nor a public school.

"Mr. Wanamaker said in 1890: 'The Western Union is now the only visible opponent ;' and the select committee of the House on the postal telegraph in 1870 said that objections to Government interference with the telegraph had 'come altogether from one quarter—viz., the Western Union Company' (H. Rep. 114, p. 13). The leading arguments advanced by the opponents of public telegraphy may now be noted, together with the answers to them.

"A public telegraph will paternalize the Government," say the defenders of monopoly. If so, it is pretty badly paternalized now, with the post-office, the fish commission, the treasury, customs, navy, army, agricultural, judiciary, signal service, and all the other departments ; but the people do not seem to desire to give up such paternalization—they appear to enjoy it. In truth, however, public service is not paternalism, but fraternalism.

"It will cost too much." It need not cost the people \$1 of taxes to establish the postal telegraph. Plenty of capitalists are ready to build the lines for the Government, introduce low rates, and agree to turn the plant over to the nation for

Objections.

actual value at the end of 15 or 20 years, or allow the service to pay for the plant gradually (as in the case of the Springfield Electric Works, see *Arena* for December, 1895), a method that would give the people a clear title in a few years, even at rates far lower than those in force now. (See testimony of the representatives of New York syndicates that were ready and willing to build a postal telegraph system under the provisions of Wanamaker's bill. The Bingham Com. Hearings, March 4 and 14, 1890.) It would be better still to build or buy and issue treasury notes in payment ; this would correct in part the evils of the vast contraction of the currency that has so long oppressed the people and secure the telegraph without a burden. Or bonds could be issued and the service let to pay the debt in 15 or 20 years, on the plan by which Wheeling secured her gas works. In either way no taxes are needed. As for the cost of operation, the select committee on the telegraph in 1870 calculated that the Government could do the business performed by the Western Union at a cost of at least \$1,500,000 a year lower than the Western Union could do it; the absolute saving would be at least that much by reason of combination with the post-office and consequent saving in rent, fuel, light, and the distribution of labor. (H. Rep. 114, p. 44.) As the telegraph plant and business is more than twice as large now as in 1870, the saving in the same proportion would not be less than \$3,000,000 a year. This is on the supposition of continuing to do business by the methods now in use ; but if improved methods well known in the electrical world were adopted in the postal telegraph, the saving would be far greater—so great, indeed, that there seems every reason to believe a uniform rate of 5 cents a message of 20 words would yield a substantial profit.

"It is not the Government's business." 'It is out of the Government's sphere.' Senator Edmunds does not

think so (see Sen. Rep. 577, part 2); nor Walter Q. Gresham (Postmaster-General's Rep. 1883); nor Judge Clark, nor 16 or more committees of Congress, nor Congress itself, nor the Supreme Court of the United States. (See for authorities the last topic of this article, 'Duty of the Government to Establish a Postal Telegraph.') Henry Clay did not think the telegraph was out of the Government's sphere; nor did Charles Sumner, of Massachusetts; nor Thomas Jefferson, Alexander Hamilton, James Madison, Benjamin Franklin, and the other founders of the Constitution who expressly made the transmission of intelligence a part of the business of the Government.

"The Government could not be sued." It will be an easy matter to provide that damages for error or delay should be recovered by suit against 'The Telegraph Department.'

"But the increase of patronage will be dangerous." There need not be any increase of patronage. The Government may contract for telegraphic service as it does for railway service. Or it may own the lines and contract for the service. Or better far, it may own and operate the lines under strong civil service rules, as is the case in England, France, Germany, Switzerland, Australia, and other countries. (See 11th Report U. S. Civil Service Com., 1895.) With a solid civil service law and a non-partisan board (*i. e.*, a board composed of a member from each party) to administer it, an increase of public employees no longer means an increase of patronage, for there is no patronage where appointment depends upon merit proved in competitive examination; promotion follows on valuable service, and removal is only for serious cause judicially ascertained, with a right of appeal to the regular courts. Such provisions would form a part of a wise postal telegraph law. But even without them the danger from increase of patronage would be slight. The United States has 240,000 employees. In combination with the post-office, the telegraph would not require an addition of more than 20,000, a large part of them women and boys who are not yet able to vote. With a population of 70,000,000 and a voting class of 18,000,000, a group of 260,000 Government employees does not look alarmingly dangerous, especially when we consider that 48,000 are already under civil service rules, 40,000 more in army and navy, and another large body composed of quite inoffensive women.

"Only one in 60 uses the telegraph. No probable reduction of rates or increase of facilities would be apt to raise the proportion much, and it would not be fair to put on the taxpayers the burden of a service used only by a few." As already remarked, there will not be any burden about it. The business can easily pay for itself and more, as it does in many countries across the sea. It will be more apt to lower the rates of taxation than to raise them. But there is another and deeper falsity in the above objection. The statement that 'no probable reduction of rates or increase of facilities would be apt to raise the proportion' of people using the telegraph is a statement that could only be made by one quite unacquainted with the history of the telegraph and the post-office, both in Europe and America, and with the history of this discussion, or by one entirely free from any inconvenient regard for the truth. The facts set forth in numerous public documents in this country and in Europe, and reported to Congress by its committees again and again, conclusively prove that reduction of rates and increase of facilities produce the most astonishing increase in the use of the service. 'The reduction of rates one half in Belgium and Switzerland doubled the correspondence in one year' (Sen. Rep. 242, 43-1, p. 4), and the extension of facilities was slight, only one fifteenth to one twentieth, merely the normal growth. (See statistics, H. Rep. 114, pp. 2, 56.)

"And the Western Union does not do and never has done one half the business its lines would carry, so that the total increase would be from twenty to one hundred-fold the present business. The development of business consequent upon low rates and the extension of lines results from the use of the telegraph by a larger number of people. The wealthy people of the cities use it now all they wish to; they would use it little if any more with a five-cent rate than with a rate of 25 cents. But to the poor and to people in moderate circumstances, the difference between the telegraph and postal rates is practically prohibitive except under the stress of very special need. President Green of the Western Union said that 46 per cent. of their business is speculative, 34 per cent. legitimate trade (his own words), 12 per cent. press, and 8 per cent. social (Bingham Hearings, 1890, p. 36). In Sen. Rep. 577, part II, p. 15, the then president of the Western Union said the company's social business was 5 or 6 per cent. of the

whole. In Belgium the social messages constitute 55 to 63 per cent. of the whole."

The real reason why the Government has not adopted the postal-telegraph is undoubtedly shown by the following quotations from Postmaster-General Wanamaker's argument before the Congressional Post-Office and Post-Roads Committee in 1890:

"In the present discussion Mr. F. B. Thurber, of New York, has given a list of the directors of the Western Union Telegraph Company. I beg to append their names: Norvin Green, Thomas T. Eckert, John T. Terry, John Vanhorne, Jay Gould, Russell Sage, Alonzo B. Cornell, Sidney Dillon, Samuel Sloan, Robert C. Clowry, George J. Gould, Edwin Gould, John G. Moore, Cyrus W. Field, Henry Weaver, Percy K. Pyne, Charles Lanier, Austin Corbin, J. Pierpont Morgan, Frederick L. Ames, John Hay, William D. Bishop, Collis P. Huntington, George B. Roberts, Sydney Shepard, Erastus Wiman, William W. Astor, Chauncey M. Depew, James W. Clendenin, Henry M. Flagler.

"Mr. Thurber used this list of names to answer the question why the public cannot have the great boon of a postal telegraph. 'No such list of names,' he added, 'can be found in the directory of any other corporation in this country. Every name represents some great interest. They are the richest and the best in the financial world. They deservedly rank as our best citizens; their names are found scattered throughout the religious and charitable world, but in the matter of transmitting intelligence their interest diverges from that of the general public, and it remains to be seen whether 65,000,000 of people or the comparatively few stockholders which these men represent will be able to control the great force of electricity as applied to the transmission of intelligence.'

"According to uncontroverted statements made before your honorable committee, the capital stock of the Western Union Telegraph Company in 1858 was \$358,700. The stock dividends declared between 1858 and 1866 amounted to \$17,810,146, and the stock issued for new lines was \$1,937,950; so that the capital stock on July 1, 1866, was \$20,133,800. In 1866 new stock was created to the amount of \$20,450,500; so that the total capital of the Western Union on July 1, 1867, was \$40,584,300. The largest dividend declared by the company up to 1874 was 4 1/4 per cent. The largest amount of stock ever divided at one time was \$10,000,000, and for a period of seven years the dividends were about 100 per cent. a year on its average capital. It was by adding dividends to dividends, and by piling the one up on top

of the other that this tremendous amount of \$46,000,000 of capital and debt was created. The history of the company shows no change of policy. In 1874 the company bought up its own stock and the stock of other telegraph companies and accumulated a fund of over \$15,000,000, which was held in one shape or another in the treasury of the company. An investment of \$1000 in 1858 in Western Union stock would have received up to the present time stock dividends of more than \$50,000 and cash dividends equal to \$100,000, or 300 per cent. of dividends a year. These have been some of the dividends declared: In 1862, 27 per cent.; in 1863, 100 per cent.; in 1864, 100 per cent.; in 1878, \$6,000,000; in 1881, one of \$15,000,000 and another of \$4,300,000; in 1886, 25 per cent. The Western Union plant, exclusive of its contracts with railroads, could be duplicated for \$35,000,000. Its present capital is \$85,960,000. It has realized \$100,000,000 of net profits in 25 years by its high charges. . . .

"The great question," said Congressman Raynor, discussing the Glover Telegraph Bill at the last Congress, "that underlies the discussion of this measure, is whether we are not in the hands of a monopoly that not only has the right to fix its charges arbitrarily, but can crush opposition whenever it encounters it. Of all these monopolies, I submit that the telegraph system of this country, substantially owned and controlled by one man, is the worst and most dangerous of them all." "It is no longer safe or expedient," Mr. Raynor went on, "to intrust into the hands of one overpowering monopoly the telegraph business of this country. It is a power that not only can be used, but has been perverted, for purposes hostile to the best interests of the people; the markets of the country, its finances, and its commercial interests to so large an extent depend upon the honest and honorable administration of the business of this company, that the people are not in a mood to repose a trust of this character any longer

Western Union.

without competition in the hands of a stock-jobbing corporation.' I have tried to show that the telegraph service of this country ought to be cheaper and not inaccessible to the people. Business men generally, and the industrial and farming classes, too, demand that the service shall be more efficient as well as cheaper. The ordinary opposition, which under the direction of competent men would bring prices down and make the service quicker and more accurate, has been tried a score of times and it has always failed. There is practically but one telegraph company in this country to-day. I say this because the Postal Telegraph Company has an arrangement with the Western Union by which prices are to be kept up.

"Since the introduction of the quadruplex 20 years ago, the Western Union Company has, I am told, made but one change or improvement in its method of telegraphic transmission, having for their object the greatest speed or the transmission of a larger volume of traffic of a given wire. I refer to the Wheatstone automatic, an English invention which has been in successful use on the Government lines in that country for 8 or 10 years. On the other hand, England has not only adopted our quadruplex, but also the Delaney multiplex, another American invention."

Some of the more statistical facts as to the telegraph are as follows :

"In 1774 Lesage, of Geneva, constructed a telegraph consisting of 24 wire signals, being sent over each wire for different letters of the alphabet by frictional electricity. This had been suggested in an article in *The Scots Magazine* of February 1, 1853. In 1816 Francis Ronalds constructed a telegraph of one wire, using frictional electricity and exhibiting signals by the divergence of pith balls. In 1820 Ampère suggested the ap-

plication of the galvanic current. In 1830 the first actual telegraph was constructed, extending from Paddington to Drayton, England, 13 miles. Dr. W. O'Shaughnessy constructed the same year the first over-ground line in Calcutta, India. Samuel F. B. Morse, of New York, invented the system of a pencil moved by an electric magnet and a single conducting circuit in 1836. The first line was constructed from Washington to Baltimore (40 miles) in 1844, and the first message transmitted May 27, 1844.

Statistics.

The first experiments in submarine telegraphy were made in Calcutta in 1839 by Dr. O'Shaughnessy. In 1851 a permanent cable was laid across the English Channel. The first Atlantic cable was successfully laid in 1858, but soon failed to transmit words, and not till 1866 was an Atlantic cable successfully submerged. According to F. L. Pope, in Johnson's Cyclopaedia, the total length of line in all countries in 1894 was 900,000, of which 158,000 is submarine. The number of messages transmitted in 1893 was: Great Britain, 69,907,848; United States (Western Union in 1894), 58,632,237; France, 47,017,117; Germany, 33,172,116; Austria, 12,068,084; Italy, 9,681,512; Hungary, 6,522,302; Belgium, 5,414,864. The rates for service are as follows: England, 12 cents for 12 words; Germany, 17 cents for 10 words, and a discount of a cent and a quarter for every word less than 10; Italy, 18 cents for 15 words; Switzerland, 10 cents for 10 words; Belgium, 9 cents for 10 words. In France the rate is 10 cents for 10 words within the country, and 2 cents per word from the French-African possessions, a 10-word message from North Africa costing but 20 cents. Distance is not considered in making the rates. No more charge is made for 100 than for 1 mile, the same principle being applied as that governing our postal system. According to the *World Almanac* for 1896, the following are the statistics of the Western Union Telegraph Company :

YEAR	Miles of Poles and Cables.	Offices.	Messages.	Receipts.	Expenses.
1866.....	37,380	2,250
1870.....	54,109	3,972	9,157,646	\$7,138,737.96	\$4,910,772.42
1875.....	72,833	6,565	17,153,710	9,564,574.60	6,335,414.77
1880.....	85,645	9,077	29,215,509	12,782,894.53	6,948,956.74
1887.....	156,814	15,658	47,394,530	17,191,999.95	13,154,628.54
1888.....	171,375	17,241	51,463,955	19,711,164.12	14,640,592.18
1889.....	178,754	18,470	54,108,326	20,783,194.07	14,565,152.61
1890.....	183,917	19,382	55,878,762	22,387,028.91	15,074,303.81
1891.....	187,981	20,098	59,148,343	23,034,326.59	16,428,741.84
1892.....	189,576	20,700	62,387,298	23,706,404.72	16,307,857.10
1893.....	189,936	21,078	66,591,858	24,978,442.96	17,482,405.68
1894.....	190,303	21,166	58,632,237	21,852,655.00	16,060,170.00
1895.....	189,714	21,360	58,307,315	22,218,019.18	16,076,629.07

The average toll per message in 1868 was 104.7; in 1880 was 31.2; in 1800 was 32.4; in 1891 was 32.5; in 1892 was 31.6; in 1893 was 31.2; in 1894 was 30.5; in 1895 was 30.7. The average cost per message to the company in 1868 was 63.4; in 1889 was 22.4; in 1890 was 22.7; in 1891 was 23.2; in 1892 was 22.3; in 1893 was 22.7; in 1894 was 23.3; in 1895 was 23.3.

FRANK PARSONS.

TELEPHONE, THE.—Recent developments promise to place the telephone within the reach of all. Service is being offered in places of moderate size at \$8 to \$12 a year by private companies. If the telephone and telegraph were combined with the post-office, it might soon be possible for every farmhouse to have the means of cheap and almost instantaneous communication with neighboring towns, and any citizen could at trifling cost communicate with any other in the country. The arguments for and against the public ownership of the telegraph, and will be found under that head. We confine ourselves here to the statement of a few of the most significant facts.

Nations that begin with public ownership do not change to private; but there is a strong tendency toward public ownership in countries that begin with the private system. Belgium began with private telephones in 1884, but found it best to transfer them to public control, and January 1, 1893, all the telephone lines in the State became public property. Great Britain has ciphered out the same sum in social economics, and after many years of private telephony reached a similar conclusion and established a national system of telephone lines in 1895. Austria has moved along the same path, and since January, 1895, private telephone companies have ceased to exist in Vienna. Norway also has decided (1895) to take possession of all the trunk telephone lines. When the State owns the trunk lines and the municipalities own the local exchanges you have the very best possible telephone system. Trondhjem, in Norway, has bought up its telephone system.

Other cities like Rotterdam, Amsterdam, etc., are constructing municipal plants, and many more are discussing the subject. In America, the call for a postal telegraph includes the telephone. On the other hand, France, Germany, Sweden, Switzerland, the Australian republics, and other countries that have had public telephones for years show no disposition to transfer them to private corporations.

The charges under public ownership are a mere trifle compared to the ordinary charges of private monopoly—from \$8 to \$16 a year public, and \$36 to \$250 under private monopoly is about

the relative charging power. There is some competition just now in consequence of the expiration of the telephone patents, so that even private companies are making low rates; but a vast syndicate is forming for the control of the telephone, the Western Union and the Bell have combined, and the probability is that monopoly, by force of enormous combinations, will take the place of monopoly by patent; if so, the people will soon be little better off than before the patents expired unless they adopt municipal ownership of local lines and national ownership of the distance telephone.

TELEPHONE CONVERSATION CHARGES.

PUBLIC TELEPHONE.	Local Conversation by Non-Subscribers.	Rate between Neighboring Places.	Rate between Distant Places.
Germany	6 cents.	12 cents.	24 cents.
France	5 "	7 to 10 "	20 to 80 "
Belgium	5 "	5 to 7 "	20 "
Switzerland	2 "	6 to 10 "	15 "
Austria-Hungary	4 "	12 "	20 to 40 "
Trondhjem	2½ "	4 to 6½ "
Great Britain (Postal Rates)	6 "	6 to 12 "	12 cents to \$1.00
PRIVATE TELEPHONE.			
United States (Bell)	10 to 15 cents.	15 to 25 cents.	30 cents to \$10.00

The first suggestion of the possibility of transferring sound electrically was made by Charles Bourseul in 1854, and in 1861 Philip Riis, in Germany, published an account of experiments in this line. A working plan was, however, first invented by Alexander Graham Bell, and patented March 7, 1876. According to the

World Almanac for 1896, the following are the latest statistics made public by the American Bell Telephone Company, which practically monopolizes the telephone business of the United States. The figures are for January 1 of each year:

	1892.	1893.	1894.	1895.		1892.	1893.	1894.	1895.
Exchanges.....	788	812	838	867	Miles of wire sub-marine	1,029	1,336	1,637	1,856
Branch offices	509	539	571	572	Total miles of wire ..	266,456	307,791	353,480	396,674
Miles of wire on poles	180,139	201,259	214,676	232,008	Total circuits	186,462	201,322	205,891	212,074
Miles of wire on buildings.....	14,954	14,980	16,492	14,525	Total employees	8,376	9,970	10,421	11,004
Miles of wire underground.....	70,334	90,216	120,675	148,285	Total subscribers	216,017	232,140	237,186	243,432

The number of instruments in the hands of licensees under rental at the beginning of 1895 was 582,506. The number of exchange connections daily in the United States is 2,088,152, or a total per year of over 670,000,000. The average number of daily calls per subscriber was eight and one half. The company received in rental of telephones in 1894, \$2,502,992.17. It paid its stockholders in dividends in 1894, \$2,400,000. The capital of the company is \$20,000,000.

TEMPERANCE.—(See also SOUTH CAROLINA DISPENSARY SYSTEM; HIGH LICENSE; INTemperance; LIQUOR TRAFFIC; NATIONALIZATION OF THE LIQUOR TRAFFIC; NORWEGIAN SYSTEM; PROHIBITION; PROHIBITION PARTY; POVERTY; WOMAN'S CHRISTIAN TEMPERANCE UNION.

We give in this article a brief sketch of the temperance movement, referring the reader to the above articles for details.

The temperance movement may be said to be a modern movement; intemperance is as old as history. We find instances of intoxication in Genesis, the oldest Hebrew writing, and in Homer's pictures of early Greek social life. Intoxication is described or referred to in the ancient books of China, the *Vedas* of India, the *Avestas* of Persia, and in all early traditions. The fiery "rice wines" of India and China matched the drugged wines of Greece and Rome. Fermentation was usually the early source of intoxicating drinks; distillation has been known in Europe at least for only six centuries. Spirit drinking is said to have developed first in northern climes, and perhaps in England. There were, however, some early attempts at temperance reform. The Chinese claim that eleven centuries before Christ some of their emperors made strenuous temperance reforms, one going

so far as to order all vines in the kingdom to be uprooted. In India and Persia the priesthood early made some attempts at reform, and the Buddhists taught total abstinence. Buddhist sects seem to have spread total abstinence ideas far and wide, and among the Hebrews there were various total abstinence orders and sects, such as the Nazarites and Rechabites in olden times, and the Essenes and Therapeutæ of the time of Christ. Draco is said to have punished drunkenness with death, and Lycurgus, king of Thrace, to have ordered all vines to be destroyed, as did later Terbalduis, a Bulgarian prince. The Carthaginians forbade wine in the camps and among magistrates holding public office. In northern climes the use of intoxicating beverages was universal. The Saxons were mighty eaters and drinkers. The mead horn plays a large part in all Saxon literature. Mead or metheglin they made from honey, beer from barley. Weddings, christenings, and funerals were scenes of intoxication, sometimes of orgies. The burial clubs (see GUILDS) were drinking clubs. The Church strove somewhat for reform, perhaps because the clergy needed it. St. Gildas the Wise in 570 A.D. ordered the drunken clergy to be punished. St. David (569) punished also the publican. King Edgar, at the instance of Dunstan, limited by law the number of taverns and the size of the pots. By a law of 1285 taverns in London were to close at curfew. This was to prevent crime. Yet drinking increased. When George Neville was made Archbishop of York, in 1464, we are told that 300 tuns of ale and 100 of wine were consumed. Bacon saw that "all the crimes on earth do not destroy so many of the human race nor alienate so much property as drunkenness." Beginning with 1603, legislation against ale houses and drunkenness is very frequent, but accomplished nothing. According to Bishop Earle, the public house was the rendezvous for all classes. All or almost all the clergy drank. Decker says that in 1632 a whole street was in some places but a continuous ale house, not a shop to be seen between red lattice and red lattice. The Puritans were about as bad. Pepys says Monk's troops were most of them drunk all day. Even the women drank. Lecky says that in 1688, 12,400,000 bbls. of beer were brewed for a population of a little over 5,000,000, or about 90 gals. a head against about 29 at present in England. In the eighteenth century gin-drinking increased. Retailers hung out signs saying, "Drunk for *1d.* Dead drunk for *2d.* Straw for nothing." Eleven million gals. of gin were consumed in England in 1733; nearly 20,000,000 in 1742. In 1749 there were 17,000 gin shops within the bills of mortality. Crime and immorality rose. In 1736 Parliament tried to suppress gin-drinking by putting a prohibitory tax on it, but the illicit trade was so great that it soon went to the other extreme, and made the trade well-nigh free. But this did no good. In 1751 distillers were forbidden to sell to unlicensed publicans, and tipping debts could not be collected by law. According to Lecky, this did some good. Gin began to give way to beer, a vast improvement.

Eighteenth Century.

In the American colonies the evil was as bad. Dr. Dorchester (*Problems of Religious Progress*) tells us that in 1790 $2\frac{1}{2}$ gals. of distilled spirits and wine were consumed per capita; in 1810, $4\frac{1}{2}$; in 1823, $7\frac{1}{2}$ of spirits alone. At a later date there were 400,000 confirmed drunkards, while everybody drank a little, and often to excess. The rich drank French and Spanish brandy; the middle classes, Jamaica rum; the poor, New England rum. Drunkenness was not uncommon among the clergy, and an ordination was often little short of a debauch. Rum was a requisite of every gathering. All public men drank. (See also CRIME.)

The modern temperance movement began in the first quarter of this century, in England first, tho it first gained headway in the United States. In 1800 Micajah Pendleton, of Nelson County, Va., signed and circulated a total abstinence pledge. In 1804 Dr. Benjamin Rush (*q.v.*), of Philadelphia, wrote an important temperance paper, and in 1805 Dr. Ebenezer Porter, of Connecticut, preached an important sermon. In 1808 Dr. J. B. Clark founded, in Saratoga County, N. Y., the Temperance Society of Moreau and Northumberland. In 1813 the Massachusetts Society for the Suppression of Intemperance was formed. In 1826 the American Society for the Promotion of Temperance was founded in Boston, based upon total abstinence, the Rev. Mr. Hewitt being the first general agent. By 1829 there were 11 State and about 1000 local societies. The same year six sermons by Lyman Beecher, of Litchfield, Conn., produced a wide effect. In 1833 there were 6000 local societies and over 1,000,000 members; 2000 distilleries had been stopped. Most of this early temperance movement, however, was opposed simply to the use of distilled spirits, and the pledge in general use had reference to these alone. Cider, beer, and wine were generally considered harmless or indispensable. Total abstinence from all intoxicating liquors was embodied in Pendleton's pledge of 1800 and in the New York society of 1809 and in a few other local societies, but was voted down by the general society in 1833. In 1836, however, at the meeting in Saratoga it was finally adopted, and the American Temperance Society has since been committed to total abstinence. In 1840 began the great but brief Washingtonian movement, when six intemperate drinkers in Baltimore, Md.—Mitchell, Hoss, Anderson, Steers, McCurley, and Campbell—met one Friday evening, April 2, at their usual resort, and suddenly resolved to reform. They drew up a pledge, signed it on the spot, calling themselves the Washingtonian Society. They began to hold public meetings, and met with great success. Crowds attended, and thousands took the pledge. Many became speakers, and Washingtonian societies were organized everywhere. In four or five years it is estimated that 150,000 drunkards and 500,000 others signed the pledge. The movement, however, did not endure. The toper's motley became the sensational talk of speakers, and ignorant and sometimes evil men, caring only for notoriety or pay, ruined the movement. In 1842 the Order of the Sons of

The United States.

Temperance was founded in the city of New York, the first society modeled after Masonic ideas. In 1845 the Order of the Templars of Honor and Temperance, and in 1851 the Order of Good Templars (*q.v.*) were formed.

Modern Movements.

In 1845 a law in New York State prohibiting the public sale of alcoholic liquor was passed and referred to the people, and received a large majority, but in 1847 it was repealed. In 1851 the Maine law (*q.v.*) was passed. (For temperance legislation since that date, see PROHIBITION; HIGH LICENSE; LOCAL OPTION.) In 1874 the Woman's Christian Temperance Union commenced its important and successful movement, for an account of which see that head. The influential Catholic Total Abstinence Union was formed in Baltimore in 1872.

In Great Britain Dr. Trotter, of Edinburgh, published a book on the effects of intemperance in 1809. The first temperance society was organized in Skibbereen, in Ireland, in 1818. The first society based on total abstinence was formed at New Ross, Ireland, by the Rev. George Cane in 1829, tho the same year one was formed in Glasgow, Scotland. Within a year there were 25 societies in Ireland. The first society of England was formed in Yorkshire in 1830, teetotalism being still used as colloquial for total abstinence, and the same year the London Temperance Society held its first public meeting. In 1831 the British and Foreign Temperance Society was formed, and in Dublin the Hibernia Temperance Society. In 1830 the Duke of Wellington Beer Act tried to encourage the use of beer instead of spirits. In 1834 a select committee of the House of Commons was appointed to report on the subject. Mr. Muchmoore in this report describes the evils of the day. Fourteen public houses were patronized by 2750 persons each per day. They had connected with them large halls invisible from the street, where girls of the town, sailors, etc., danced. According to the census there was then one public house for every 20 families in the United Kingdom. To-day there is not one for every 50. The spirits distilled in England rose from 43,000,000 in the four years, 1791-95, to 154,000,000 in 1826-31.

In 1838 the Rev. Theobald Mathew (Father Mathew), a Roman Catholic priest in Cork, in Ireland, commenced a temperance movement, and in the space of five months administered the pledge to 150,000 persons in Cork alone. In Galway 100,000 took the pledge in two days. He traveled in Ireland and England, and in 1850 came to America, everywhere finding great success, and becoming known till his death, in 1856, as the Apostle of Temperance. The Father Mathew societies of the Catholic Church still attest his memory, tho much of his early work died away. From 1840 to 1850 the temperance movement languished, and in 1850 the British and Foreign Temperance Society perished of inanition. In 1853 a United Kingdom Alliance was formed in Manchester to agitate for prohibitory laws. Various ideas were introduced from the United States, and in 1863 the Order of Good Templars. The Church of England Temperance Society was formed in 1862. Total abstinence became the

cry. A Working Man's Teetotal League was formed and other similar societies. In 1872 was passed the Licensing Act, the most important act of the century, tho acts have been very numerous, most of them ineffective. In 1876 the House of Lords appointed a select committee on the subject. At present the Church of England Temperance Society seems to be the largest society with 609,319 members, 384,289 of these being juveniles, and of the remainder 174,637 being of the total abstinence section. According to Mr. Nelius, one person in England out of eight is a teetotaller, but Mr. Arthur Shadwell, to whose articles in the *National Review* for December, 1895, and April, 1896, we are much indebted for our facts, very much questions whether this is not a great exaggeration.

During recent years notable advance has been made in Great Britain along the line of sentiment in favor of Sunday closing. Scotland has had all-day Sunday closing since 1853-54; Ireland, except in the five chief towns of Dublin, Belfast, Cork, Limerick, and Waterford, since 1878; and Wales, since 1881. Up to 1839 public houses were open throughout England the whole of Sunday except during the hours of morning and afternoon divine service. In that year, owing to the disorderly state of many of the London streets on Sunday morning, a clause was inserted in the metropolitan police act to close public houses from midnight on Saturday to one o'clock on Sunday afternoon. Other cities followed suit, and in 1854 Patten's bill further closed the public houses on Sunday afternoon from 2.30 to 6 o'clock, and 10 at night to 4 on Monday morning. This has been the law with slight modifications since that time. There is strong public sentiment in England for entire Sunday closing. Such sentiment is also spreading in Canada.

On the Continent, sentiment in favor of temperance and total abstinence is growing. In the Scandinavian countries, Norway and Sweden, the problem is being partially solved by the Gothenburg system, or State conduct of the liquor traffic. **Europe.** (For a discussion of the benefits claimed for this by its advocates and the faults charged by its opponents, see GOTHENBURG SYSTEM; NORWEGIAN SYSTEM; SOUTH CAROLINA DISPENSARY LAW.)

In France and Germany a number of medical and scientific bodies of the highest and most conservative authority have made utterances as to the evil effects of the use of intoxicating liquors. These have been in the nature, generally, of warnings against the effects of drunkenness on individual and national life, and have, therefore, furnished good refutation of the claim, made by some, that drunkenness is not a public evil in wine-drinking countries. Influential periodicals in France, like the review *Science Française*, *Le Temps*, and bodies like the French Academy of Medicine and the Association for the Advancement of Science, have taken up the fight against the beverage use of alcohol. In Germany, one of the most noteworthy of recent developments has been the publication in the *Deutsche Versicherungs-Zeitung*, of Berlin, of a lecture by Dr. Brendel,

delivered before the Anthropological Society of Munich (March 28, 1894), in which insurance companies are warned that their risks are dangerously increased by alcoholism—drink almost always shortening life.

The latest developments in Europe of the temperance movement have been steps toward the nationalizing of the trade in alcohol by France, Switzerland, and Russia. In the United States, South Carolina has tried a similar system, and other States are preparing to follow. (See SOUTH CAROLINA DISPENSARY SYSTEM for the movement in Europe and in this country.)

In the United States, the report (informally published in *The Atlantic* for February, 1897) of the Committee of Fifty, organized in 1893, says that prohibition has abolished the manufacture of distilled and malt liquors on a large scale where it has been tried, tho it has not completely excluded intoxicating drinks. It has often brought law into disrepute by its non-enforcement. The report favors the taxing system rather than license. It thinks the South Carolina system successful.

References: See the above-mentioned report, also CYCLOPEDIA OF TEMPERANCE AND PROHIBITION.

TEMPLE, WILLIAM, was born in London in 1628. Entering the diplomatic service, he represented England at the court of Brussels and in Holland. He sat in Parliament one year, but in 1680 retired from public life, and died in 1699. He wrote, among other books, *Observations upon the United Provinces of the Netherlands* (1672) and an *Essay on the Trade of Ireland* (1673), in which, says Ingram, he mingled just views and mercantilist prejudices.

TENEMENTS AND TENEMENT-HOUSE REFORM.—We consider this subject under three heads: I. The Tenement Evil; II. Statistics of Tenements; III. Tenement-house Reform.

I. THE TENEMENT EVIL.

We quote on this point from the valuable report of the Tenement-house Committee of the State of New York, dated January 17, 1895. The committee was appointed by act of the Legislature in 1894.

Under the act the following were named by the governor as members of the commission: W. Bayard Cutting, Cyrus Edson, Roger Foster, R. W. Gilder, Solomon Moses, George B. Post, and John P. Schuchman. Mr. Cutting being unable to accept the appointment, the governor appointed in his place W. D'H. Washington. Mr. Gilder was chosen chairman. The report which concerns New York City says:

"A 'tenement-house' shall be taken to mean and include every house, building, or portion thereof, which is rented, leased, let or hired out, to be occupied, or is occupied, as the house, home or residence of three or more families living independently of one another, and doing their cooking upon the premises, or by more than two families upon a floor so living and cooking, but having a common right in the halls, stairways, yards, water-closets or privies, or some of them.

"The entire population of the tenements in 1893, according to the board of health census, was 1,332,773 persons, living in 39,138 houses, out of an entire estimated population of 1,891,306. Laws touching upon tenements may, therefore, where there is no exception,

directly affect 70.46 of our population. But it is estimated that of the entire tenement-house population, as defined by law, only about four fifths really belong to the class which is usually designated by that term, the remaining fifth living in what are known as flats, or apartment-houses. The board of health, in its practical enforcement of the law, has not required its obedience in, nor made a regular inspection of, the better class of what the law defines as tenements, and which are included in that one fifth; and in the figures above quoted the most expensive apartment-houses and their inhabitants are not included at all. The population of the city living in what are generally called tenement-houses, rather than apartment-houses, is believed to be eight fifteenths, or a little over one half of the total population of New York.

"The overcrowding of other cities takes place mainly through the herding of human beings in a single room. For example, notwithstanding the great improvement in this respect in Glasgow since 1871, nearly 38 per cent. of the population of that city in 1891 slept and cooked and lived in a single room for each family.

"The committee is glad to state that this evil, tho it exists in this city to some extent, is by no means so great here as in the old world. On the other hand, we have an evil here which is peculiarly our own. The 'double-decker,' so called, is the one hopeless form of tenement-house construction. It began with the old New York dwelling altered over, and gradually a type was produced in some respects better and in some worse than the earlier forms of the narrow tenement. The double-decker cannot be well ventilated; it cannot be well lighted; it is not safe in case of fire. It is built on a lot 25 feet wide by 100 or less in depth, with apartments for four families in each story. This necessitates the occupation of from 86 to 90 per cent. of the lot's depth. . . .

"If we take the death-rate of children as a test, the rear tenements show themselves to be veritable slaughter-houses, as shown in the following table, which only covers the lower wards, where such houses are numerous:

WARDS.	Death-rate of Children Under Five Years of Age in Single Tenements.	Death-rate of Children Under Five Years of Age in Front and Rear Tenements on Same Lot.
1.....	109.58	204.54
4.....	105.69	114.68
5.....	107.99	64.52
6.....	103.56	99.54
7.....	61.78	72.58
8.....	95.58	129.56
9.....	120.78	130.56
10.....	57.20	62.58
11.....	73.12	71.49
13.....	83.05	200.59
14.....	129.56	114.12
17.....	62.04	78.36

The following is from the report of the secretary of the Commission, Edward Marshall:

"Your report on the death-rate in New York City shows that one of the most important elements which go to make it high is the presence of old and dilapidated buildings. This inspection shows that there are many houses in the city in an unsanitary condition which absolutely unfit them for habitation. One of the greatest menaces to health in the tenement-house, as it exists to-day, is the saturation of the walls, floors and everything else in the neighborhood of hallway sinks with Croton water and slops. It is thus that sinks in tenement-houses become centers of unhealthful influence. In almost every case this condition can be traced to the lack of light in the hallways. A woman going to the sink to fill her pail with water or to empty into it refuse water, is doubly likely to spill the contents of her pail if the hall be so dark as to force her to wholly or partially feel her way. And the very lack of light, which originally caused this mishap, is certain to ag-

Unfit Condition.

grate its results. If the hall is dark, having spilled the water or slops, she is unable to see what she has done, and, therefore, does not attempt to remedy it. Light in the hallways would not only in most cases prevent her from wetting the floors of the hallways, but would, in case she did accidentally do so, generally induce her to clean up the mess before she left the hall. It is true also that tenants throw refuse of improper character—such as bedroom water and human excreta—into the sinks of dark hallways more frequently than into sinks in well-lighted hallways. Where darkness makes identification of such an offender improbable, a person inclined to this kind of slovenliness has almost no reason for refraining from carrying out his vile impulse. More than 100 sinks used for such improper and dangerous purposes were discovered by this examination, and it is generally known to the health board and your committee's examiners that the use of sinks in dark hallways as urinals is by no means infrequent. These things cannot, of course, fail to threaten the health of the house in which they occur. The moral argument calling for light in the hallways of tenement-houses is a strong one. In the heterogeneous population of a large tenement-house, it is frequently true that young boys and girls receive first lessons in evil doings in dark hallways, which they would entirely escape were their actions, while passing through or pausing in the hallways, open to the view of the other tenants in the house. The impressions of the committee's examiners confirm those of such students as Mr. Jacob A. Riis and others on this point.

For Boston, the Massachusetts Labor Bureau reported in 1891 and 1892 as to the tenements. The following are some of the results :

"For the city as a whole, 67 per cent. of the estimated total population live in rented tenements, and while of the persons thus housed 12.08 per cent. is in tenements subjected to poor or bad outside sanitary conditions, and 8.38 per cent., 8.41 per cent., and 12.30 per cent. in tenements poor or bad with respect to light and air, ventilation and cleanliness, respectively, nevertheless these persons constitute but 8.09 per cent., 5.62 per cent., 5.64 per cent., and 8.24 per cent., respectively, of the estimated total population.

"The whole number of sleeping rooms without outside windows found in the city was 3657.

"Out of 3657, the aggregate number of sleeping rooms without outside windows, 113 were in tenements under excellent inside and outside sanitary conditions; 722 were in tenements under good inside and outside sanitary conditions; 337 in tenements fair as to light and air and ventilation, and classed as good with respect to outside sanitary condition and cleanliness; 583 in tenements under conditions classed as fair, both internally and externally; and 145 in tenements classed as poor both internally and externally.

"Why do the tenants of the poorer houses remain in them? It is not always poverty that compels them, altho this is generally the first conclusion. A special inquiry covering 475 families, comprising 2140 persons, residing in tenements or neighborhoods classed as poor or bad, was undertaken for the purpose of securing definite information upon this point. The result is presented in the following table :

CAUSES.	Number of Families.	Population.	PERCENTAGES.	
			Families.	Population.
Intemperance.....	205	912	43.16	42.62
Low rent.....	74	290	15.58	13.55
Poverty.....	22	103	4.63	4.81
Choice.....	53	240	11.16	11.22
Necessity.....	117	572	24.63	26.73
Nearness to work.....	4	23	0.84	1.07
Totals.....	475	2,140	100.00	100.00

"In tabulating the results, the principal cause which led the family to occupy the poor tenement has been selected, altho in some cases more than one cause was found. For instance, if poverty and intemperance were both found to be operative, and intemperance was, after investigation, deemed to be the leading

cause, and poverty a result, rather than itself the main cause, the families have been classed under the head of 'intemperance' in the table. The question of choice or necessity in regard to the tenancy of these worst places was frequently difficult to determine. The word 'necessity,' as used in the table, implies that the families classed under this head were obliged to occupy the tenements in which they were found for various reasons different from the five other causes named. This explanation is required in order that the reader may not assume that where persons are classed under this head the necessity was a pecuniary one. If this had been the case, the family would have been classed under the head of 'poverty' or 'low rent' as might have been found most proper. The necessity in most cases was hardly capable of distinct definition. Sometimes it was due to the inability of families with large numbers of small children to obtain tenements in better localities; sometimes it was attributable to the unwillingness of landlords, for reasons peculiar to the case, to admit the family to better tenements; the nationality and occupation of the family were sometimes found to be factors in determining the tenancy, and sometimes the necessity of residing near the place of employment obliged the family to occupy the tenement. When proximity to the place of employment was distinctly the controlling cause, however, the families have been included under the head, 'nearness to work.' As to the matter of 'choice,' one of the causes specified in the table, it should be said that while it may seem strange that any one should deliberately choose a tenement of this class, it is nevertheless true that many recent accessions of certain nationalities prefer to live in proximity to neighbors of the same nationality, and are not unwilling to occupy poor tenements or tenements in poor neighborhoods to gratify this preference."

Concerning the moral conditions in the tenements, the Rev. J. O. S. Huntington writes in the *Forum* :

"Take one block in a tenement-house district. It will measure 700 by 200 feet. On all four sides are rows of tenements four or five stories high. Behind one third of the houses in these rows are rear houses, with smaller rooms, darker and dirtier passages, backed often by another rear house, a brewery, a stable or a factory. Altogether there are 1736

Tenement Life.

rooms. In these rooms live 2076 souls, divided into 463 families; thus, on the average, each family of five persons occupies three rooms. The population of some parts of New York is 200,000 to the square mile—the most densely populated part of London has 170,000. Of course in many cases the family is larger (some of the very poorest people take lodgers), and in a number of cases we have found 14 or 15 grown persons occupying two rooms, or even one. And then many of these 'rooms' are hardly more than closets, and dark closets at that. Almost all the bedrooms measure only seven feet by nine, and have but one door and one window. The door leads into the apartment that serves as kitchen, parlor, sitting-room, laundry and workshop, and the window opens on a dark stairway, up which the moisture from the cellar and the sewer gas from the drains are continually rising. One fifth of these rooms, too, are in basements below the level of the street, and nearly half of even the outer rooms open into courts only 20 feet wide, in which there are usually several wooden privies for the use of the 15 or 20 families in the front and rear houses. . . .

"At all seasons of the year the inhabitants of a tenement-house must meet one another in the entries (sometimes less than three feet wide), on the stairs, at the sink (there is but one on each floor); must see into one another's rooms as each person goes in and out; must use the roof, the doorway, the yard, in common. But when the summer heats are on, and men and women crowd together on the top of the house waiting for a breeze to come; when men will sit all night on a seat in the park to escape the closeness of a room where fire has been burning all day (not for cooking, but to heat the irons for the laundry or the tailor's shop); when every window must stand open to let in what little air there is; then it may be seen that privacy in a tenement-house is not much more possible than in an eastern caravansary or in the steerage of an emigrant vessel. At such a time every loud word spoken reaches the ears of scores of people. From one room come the harsh tones of a husband and wife in the heat of a 'family quarrel,' oaths and imprecations ringing out on the fetid air; from another window come the shouts

and frantic laughter of men and women (God pity them!) trying to drown their misery in liquor from the gin mill on the corner, while from the roof of a neighboring house come the words of a ribald song flung out shamelessly to all within hearing, whether they choose or not. And, as if this were not debasing enough, in many of these blocks every other house has, on the ground floor, a saloon or rum shop, from which the smell of alcohol issues at all times; where the monotonous click of balls on the pool table sounds till after midnight, when it gives place to the howls of drunken men turned out on the street; and past the door of which, often open into the entry, every person, every child, in the house must pass to and from his room.

But this by no means exhausts the abominations of the system of tenement house life. There is many a "home" where a boy or girl over 14 years old would not think of passing an evening unless compelled to do so. Think of coming back after a hard day's work in a shop to find the only sitting-room half filled with wash-tubs, the baby crying, children squabbling on the floor, or perhaps tumbling about on the bed; the walls hung with the soiled clothes and dresses of the family; the whole place reeking with the smell of fat and garlic from the hot stove; the table 'set' with coarse, broken china, strewn on a dirty board; a kerosene lamp, without a shade, smoking in the middle; a loaf of bread in the brown paper in which it was wrapped at the bakery, and a coffee-pot of black, bitter coffee. That is the scene which welcomes many a girl or boy, just

beginning to realize how differently other people live. Is it strange that they gulp down their sugarless coffee and, at the first chance, slip out into the street beneath? "I am quite aware that much of what I have written will seem overstated. It seems so to me, and yet I know that it is not. Every single fact has been verified and can be verified in thousands of cases. And this is not more than half the truth... of the horrors of a state of things where manhood is brutalized, womanhood dishonored, childhood poisoned at its very source.

"That is the present witness of those who have looked unflinchingly at the facts. Two clergymen, one of them the rector of one of the largest of our city churches, the other now a missionary bishop, formerly a hard-working priest among the city poor, have recently given public utterance to the statement that in many tenement-houses morality is practically impossible."

II. STATISTICS.

The following table gives the statistics of population, families, dwellings, and area in the 12 largest cities of the United States, as compiled from the returns of the census of 1890. In the city of New York, 82 per cent. of the families live in houses having three or more families. In Philadelphia, more than 84 per cent. of the families have each a house of its own.

CITIES.	Population.	Families.	Dwellings.	Area.	Population per Square Mile.	Average Number of Persons to a Dwelling.	Average Number of Families to a Dwelling.	FAMILIES IN DWELLINGS.

According to the census for 1890, the following percentage of the families occupied hired houses: Baltimore, 25.90; Boston, 20.00; Brooklyn, 81.44; Chicago, 71.27; Cincinnati, 80.82; New York, 93.67; Philadelphia, 77.24; St. Louis, 79.53; San Francisco, 78.46. In Boston the percentage in four wards ran from 94.81 to 96.98; in New York, eleven wards ran 97.38 to 99.14.

For statistics of density of population, see CITIES.

In Europe, altho there is no density of crowding compared with some of the wards of New York City, there is often a larger proportion of population housed in cellars or in single rooms. In Glasgow, in 1891, according to Albert Shaw's *Municipal Government in Great Britain* (p. 84), 100,000 people lived in one room and 264,000 in two rooms. The Liverpool Victoria Legal Friendly Society proscribes for Liverpool alone, on account of the unhealthiness of their character, 167 "streets wherein no members of the society may be entered" (Circular of October 13, 1886). Yet these unhealthy streets are not too bad to be the only homes of thousands of the poorer citizens of that commercial center.

Of the 1,000,000 Londoners estimated by Mr. Booth to be in poverty, practically none are housed as well as a prudent man provides for his horse. These 200,000 families, earning not more than a guinea a week, and that often irregularly, pay from 3s. to 7s. per week for filthy slum tenements, of which a large proportion are absolutely "unfit for habitation," even according to the lax standards of existing sanitary officers.

On the Continent, according to the report of the consul at Brussels in 1890, there were at that time 4601 working men's dwellings, accommodating 19,284 families. The number of families occupying an entire house was 491; three rooms, 1371; two rooms, 8058; one room, 6978; attic room, 2168; cellar, 200. The average monthly rental for one room was \$2.25, and the average daily income, 60 cents. According to the report on Germany of the English Royal Commission on Labor, in Berlin the conditions are specially bad, and the average number of persons inhabiting one tenement (*Grundstück*) has risen from 60.7 in 1880 to 66.0 in 1885. Subletting was shown by the census of 1880 to be exceedingly frequent, 7 1 per cent. of the population took in persons who boarded and lodged with them, and 15.3 per cent. took in persons to sleep (*Schlafleute*). One instance is given of a household taking 34 such night lodgers, in another case there were 11, including two women. Thirty-eight per cent. of the families taking night lodgers lived in a single room.

Rents in Berlin for one room in the center ran up \$5 per month in 1890; in the inner circle and western district they were from \$2.80 to \$3.60; in the outer circle from \$1.90 to \$2.50.

III. TENEMENT-HOUSE REFORM.

Tenement-house reform has been attempted in different ways: (1) by cleansing the tenements and attempting to reform the habits of those living in them; (2) by erecting model tenements; (3) by municipal purchase of the worst sections, destroying the buildings, and erecting better ones; (4) by inducing the removal of families to the suburbs or to become owners of their own houses.

The most noted instance of the first method is the work of Miss Octavia Hill, in London, who began her work as early as 1864. She had reached the conclusion that many people were not fitted to live in model dwellings, and could only gradually be made so. Moved to pity and indignation by the doleful situation, she unburdened her mind to John Ruskin, and said jokingly, in reference to a given property, "I wish you would buy it, put it in fair order, and let me collect the rents for you." He quickly responded, "I will," and he did. The experience in her initial effort was so satisfactory that she has since made friendly visitation of working people her life-work.

Miss Hill purchases buildings out of repair, especially those which are filled with the lowest class that has any settled habitation. The houses are put in order, but no new appliances of any kind are added. The tenants wait for these until they have proven themselves capable of taking care of them. A fixed sum is set aside for repairs; if any of it remains after breakage and damage have been made good, each tenant in turn decides in what way the surplus shall be spent, so as to add to the comfort of the house.

The pecuniary result has been satisfactory: 5 per cent. interest has been paid on the capital invested and a fund for the repayment of capital is accumulated. Miss Hill is invariably averse to giving statistics of the value of property under her control, the amount of rentals received, and the number of families visited, since she deprecates publicity. Advices, however, indicate that in 1887 Miss Hill and her friends had 5000 dwellings in their charge. She believes that there is not the same scope now for her work as formerly, the attitude of the people being much more independent.

Miss Hill's system has been largely copied in England, Scotland, and in this country: by Miss Ellen Collins in New York, Mrs. Lincoln in Boston, Miss Edith Wright in Philadelphia. Miss Collins in New York bought six houses on the corner of Water and Roosevelt streets. It was in one of the worst localities, the resort of the worst characters, and the buildings are now the most orderly.

The plan of model tenements is more ambitious. The report on the Housing of the Working People, by Professor E. R. L. Gould, the eighth special report of the United States Commissioner of Labor, describes no less than 115 enterprises of this kind in Europe and America. In Europe, they exist in almost all German cities and in many English and French. Some of them are simply commercial, while even

Model Tenements.

the semi-philanthropic ones have usually been made to pay a fair interest. The general plan of these is that of a central courtyard, around which the buildings are grouped with two and three-room flats, every room opening on the outer air. The best-known of these enterprises, tho only one among many in London, is that of the Peabody Fund. George Peabody in 1862 gave £150,000, and later increased it to £500,000 for erecting sanitary homes for the London poor. Under the

management of the trustees this was used simply as capital, and more has been added, till the fund in 1893 was \$5,406,238. Since the commencement \$1,897,935 have been borrowed, mainly from the public works loan commissioners, at an interest of about 3½ per cent.

The Guinness trust is due to the beneficence of Lord Iveagh (Edward Cecil Guinness), who in recent years made a gift of £250,000 (\$1,216,625) to improve the living environments of working people. Two hundred thousand pounds (\$973,300) was to be spent in London and £50,000 (\$243,325) in Dublin. By the terms of the trust the poorer element only among the working people was to be accepted as tenants, and the net returns were to be applied to perpetuating the work. Provision for 3245 people has already been made in London.

The Guinness trust has not yet completed its work in London. Four different estates have been created, containing in all 263 one-room, 541 two-room, and 139 three-room tenements. Three thousand two hundred and forty-five persons were housed in all these buildings during the fiscal year 1893.

There are numerous other such enterprises in London—some 600 "model" tenements in all, tho not all of them are model. Many of them are simply commercial. Says Professor Gould:

"Of the 160,000 people in London, who live in real, not sham, model tenement-houses, less than 25 per cent. reside in premises owned by philanthropic corporations like the Peabody and Guinness trusts. The remainder are tenants of individual owners and of companies who expect and receive remunerative commercial returns upon their investments."

In Germany, such enterprises are very common, tho not so extensive, and are usually successful.

In New York City the principal efforts toward furnishing improved dwellings to the poor have been made by the Improved Dwelling Association, of which Mr. W. B. Cutting, R. F. Cutting, D. Willis James, S. D. Babcock, Cornelius Vanderbilt, J. W. Pinchot, John Claffin, George Bliss, and Dennison Wood are trustees; by Messrs. R. Fulton Cutting and W. Bayard Cutting, in a separate enterprise; by the New York Tenement-House Building Company and Association, of which Mr. Joseph Drexel, Mr. Oswald Ottendorfer, and Dr. Felix Adler have been and are the animating spirits; by the Chichester estate; by Miss Ellen Collins and by Mr. Sloan. In Brooklyn, Mr. Alfred T. White, now commissioner of public works, has carried out an enterprise which has been an object lesson not only to New York but to the whole country.

The general idea being the same, a mere mention may be made of some other undertakings.

The Improved Dwellings Company, of Brooklyn, is the outgrowth of a successful experiment in providing model tenements for working people by Mr. Alfred T. White. Nearly 20 years ago he made a private investment, and succeeded so well that he induced other members of his own family to cooperate in the work. The result has been the erection of buildings accommodating nearly 500 families, and the most satisfactory demonstration which has probably yet

occurred in this country of the financial success which may attend this form of philanthropy.

The Astral Apartments, also of Brooklyn, are owned by the Pratt Institute, and accommodate some 325 persons. Such are but a few of similar undertakings in New York and Brooklyn. In Boston, a cooperative building company was incorporated in 1871. In Philadelphia, Mr. Theodore Starr has been active in this line. Almost all of these enterprises have been financially successful. Says Professor Gould of them in an article in the *Yale Review* for May, 1896, based on his report:

"There is no combination so mellifluous as philanthropy and dividends. Humanity is never averse to simultaneous expansions of heart and pocket. . . .

"In America, out of the avowedly commercial enterprises engaged in furnishing improved housing facilities, but one paid less than 5 per cent.; 0.06 and 10 per cent. represent the maximum of net profits in two specific instances. The reason alleged for being temporarily unable to earn more than 2 per cent. in the single exceptional case was a certain prejudice against the appearance of the building, which working men thought looked too much like a barrack or public institution. This notion bids fair to pass away, since families who came to live there show a tendency to remain.

"Of the two American semi-philanthropic housing corporations mentioned, both earned up to the fixed limit—viz., 4 per cent., and in addition from ¼ to 1½ per cent. for reserve.

"In Europe but 3 out of the 20 commercial housing enterprises failed to earn at least 4 per cent., while 19 earned 5 per cent. and upward."

Municipal undertakings are mainly confined to Great Britain. In 1866 Glasgow redeemed a tract of 86 acres. Mr. M. T. Reynolds, in his monograph on *The Housing of the Poor in American Cities*, published by the American Economic Association, says of this enterprise in Glasgow and of similar ones in other English cities:

"The city of Glasgow may serve as an excellent example of expropriation, not only because of the large scale on which the work was undertaken, but because of the shrewdness with which it was carried out and the good results that followed. The city is very old, and, like all medieval towns, densely built. The lines of the streets in the older parts of the town had not been disturbed, tho the buildings had been rebuilt, so that in certain portions it was more densely crowded than any European town. The city was a maze of narrow and filthy streets, with lanes and alleys lined with old decaying houses, in which swarmed a population so dense that in some cases it reached 1000 to the acre.

"In 1866 a plan was devised for redeeming a tract of 86 acres, comprising the whole of the ancient town. Authority was obtained from Parliament to purchase property and tear down buildings, the expense of which was to be met by a tax or rental of sixpence on the pound for five years, and twopence for 10 years longer. This tax was reduced to fourpence after the first year. The ground purchased was cleared, streets were laid out and the property was resold to be built on by new owners. The financial management was admirable. £350,000, raised by taxation, furnished sufficient capital for all improvements, and the net cost to the city, including suits lost, interest on cost of land lying idle, and all expenses of management, is estimated at about £180,000. Artificial elevation of prices by land-owners, in view of a sale to the city, was avoided by judicious management. All bargains were made individually, by a private agent, and no striking improvement, which should enhance the value of the land at any given point, was undertaken until all the land affected by it had been purchased.

"Tenants in the purchased dwellings were not evicted until places could be found for them elsewhere. The knowledge that they were to be disposed caused the erection of buildings and tenements for them where land was available, in the outskirts of

**Municipal
Enterprises.**

the town. The result of these changes was that the center of the city, in its reclaimed condition, was built up with shops and warehouses, or houses for the middle class, while the poorer classes were housed on the outskirts, a much healthier condition of things than had before existed.

"Seven model tenements were erected at a cost of £90,000, but these were soon sold to private owners, as they were found to be unprofitable, because, being erected at the expense of the city, they were considered as public charities, and were consequently unpopular.

"The death-rate, which had been 32.4 per 1000 from 1868-70, fell to 25.5 per 1000 from 1880-82. The number of crimes decreased from 10,899 in 1867 to 7869 in 1873.

"Five other towns where expropriation has been tried gave the following results:

	Total Cost of Property.	Estimated Loss.
Swansea.....	£61,280.....	£11,044
Wolverhampton.....	162,307.....	45,307
Derby.....	86,540.....	37,774
Nottingham.....	84,500.....	35,500
Newcastle-on-Tyne..	40,000.....	18,300

"From which we see that the average net charge was more than 30 per cent. on the original cost of the property.

"In Birmingham 43 acres in the worst districts were cleared, and a new street 65 feet wide was run from the heart of the city. The land was then leased on long leases. The former population was 9000, comprised in 1335 houses. In the first two years 4004 small houses, accommodating 25,000 persons, were built by private enterprise. The death-rate decreased perceptibly.

"The total for eight streets showed a reduction from 26 per 1000 to 20 per 1000, a saving of 2400 lives per annum."

Mr. Albert Shaw (*Municipal Government in Great Britain*, pp. 104, 105) says of Glasgow's purchase:

"The property still held by the trust is valued, at present reduced prices, at less than its cost. The margin of shrinkage has, however, been practically covered by current taxation, so that the account now stands about even—i.e., the assets and liabilities of the trust are at a balance. The act authorized an annual assessment of sixpence in the pound of rental valuation, but the trustees have steadily reduced the levy until it is now only a halfpenny.

"The principal improvement made is a system of modern streets in the center of the city that will be of advantage for centuries, and will repay the cost hundreds of times over. Twenty-nine new streets have been formed and 25 old ones greatly widened and improved. The old insanitary tenement property has not all been demolished. . . . The city is, therefore, to-day a landlord on a large scale, and is holding really insanitary property for the sake of the rents, waiting for an opportunity to sell the sites before demolishing the buildings. Its rents now bring in annually about \$100,000, which sum goes far toward offsetting the interest charge on the property held for sale. The improvement trust has given the city, among other things, the handsome new Alexandra Park. Since 1892 the trust has, in various ways, assumed a fresh activity. The enlargement of the city has made necessary new tasks of reform, and it is expected that Parliament will give renewed and greatly extended powers, under which various other areas of Glasgow will be subject to compulsory purchase and reconstruction of streets and houses."

London in 1875 and 1879 bought 42 acres in the heart of the tenement district inhabited by 20,000 people, and sold it to working men at a net loss of £1,211,336.

These are by no means all the municipal enterprises in England of this kind. (For other enterprises in London, see LONDON; COUNTY COUNCIL.) Edinburgh in 1867 dispossessed 1500 families, expending \$3,000,000, and now has plans involving as much more, to be spent in buying out the worst slums and erecting model tenements. Liverpool has erected several municipal artisans' dwellings.

The corporation of Liverpool has more recently erected other laborers' dwellings.

Outside of England practically nothing has been done on these lines.

The efforts at inducing the tenement population to live in the country or to buy homes of their own have been very varied. In the United States, England, and in Scandinavian countries these efforts have mainly taken the form of building associations (*q. v.*) and have been very successful, especially in Philadelphia. Three thousand English societies possess an undistributed surplus of \$10,000,000, and have been instrumental in furnishing nearly 400,000 homes. Professor Gould, however, says of this plan (article in the *Yale Review*, May, 1896):

"Cooperative building and loan associations have rendered most valuable individual and social service, but, like all other forms of pioneer effort, they may be improved. They present three leading drawbacks:

"1. Expense to borrowers is greater than is absolutely necessary. Enhanced profits to the lender—and he usually gets them—come from the pockets of acquiring proprietors who are borrowers.

Model Dwellings.

"2. Business skill of a high order is not readily available for management, involving occasional losses or failures.

"3. In case of the death of a borrower before his term payments have been completed, his family is often obliged to surrender the home under disadvantageous circumstances."

Describing a better plan, he says:

"The cheapest, fairest and most effective scheme for facilitating the proprietorship of homes among working people, in existence at the present time, was originated in Belgium in 1889. It has had seven years' trial, and is steadily growing in favor. More than 60 companies are now in operation. Other countries, notably France and Germany, are seeking to apply the same system. This measure is not socialistic, altho the loan capital comes from the general savings bank whose deposits the Government guarantees, and which is, therefore, in a sense an official institution. The loans are not made directly to working people, but to intermediate agencies which are responsible to the bank."

Besides these enterprises, many firms have made efforts to induce their employees to purchase their own homes on improved plans. Such efforts have been made by S. D. Warren & Company, paper manufacturers at Cumberland Mills, Me.; the Howland Mills Corporation of New Bedford, Mass.; the Willimantic Linen Company, in Willimantic, Conn.; the Merrimac Manufacturing Company, of Lowell, Mass. In Great Britain, the Lever Brothers, of Birkenhead, Eng., and James Smirton & Sons, of Carnoustie, Scotland, are leaders in this line. Sir James Gowan, at Edinburgh, erected the Pilrig Model Dwellings as early as 1850.

In France, there are cheap dwellings companies at Paris, Havre, Lyons, Rouen, Belfort, while several mining, railroad, and other companies have undertaken enterprises of the same kind for their employees. In Germany, there are such companies at Berlin, Barmen, München Gladbach, Landsburg on the Warta, Neuss, Mulhouse. Many private companies in Germany have erected such dwellings for their employees (for an example, see KRUPP), and several State railways and government departments have done the same.

In the United States, outside of private companies, Mr. Robert Treat Paine, in Boston, has erected over 100 such houses, varying in price from \$2500 to \$6500. In New York City, in

1891, a syndicate was formed with a capital of \$400,000 to put up such buildings to cost about \$3500 each. For efforts at model dwellings in communities, see GUISE; KRUPP; LECLAIRE; PULLMAN.

It is, however, generally felt that none of these methods go to the bottom of the question of the housing of the working classes. Professor Gould writes in the closing paragraph of his report (see above):

"The problem of the housing of working people includes sanitary, economic, and ethical issues of the highest importance, but a final solution can only be wrought out along economic lines."

Mr. Jacob A. Riis, closing his article on "Tenement Houses" in *Johnson's Encyclopedia*, says:

"In its real essence the tenement-house question is in all the large cities of the world a question of transportation, and must be solved finally along that line."

W. H. Tolman, Ph.D., writes in the *Arena* for September, 1896:

"In dealing with any kind of a menace to human life in a great city, it is all important that the civic authority should be delegated ample power to deal effectively with the threatened or threatening danger. Life is always of more moment than property, and the widening scope of power delegated to the municipality is a direct recognition of this fact. In American cities there is no authority allowed whereby the municipality may purchase and clear insanitary areas with a view to schemes of betterment, but there is ample provision on the statute books for the effectual betterment of insanitary houses. Till, however, the indifference of the dwellers 'above our fourteenth streets,' the influence of vested interests, and the greed of the landlord or the money-getting machine are negatived, the slum will be with us."

In the same article he quotes the chairman of the Committee on Public Health and Housing of the London County Council as writing to him:

"We have found that the abolition of slums by buying the slum area outright, as our law allows us to do, is not entirely successful. There is such a large net loss on the operation financially, that the ratepayers would not stand it long. On a large scale it leads to overcrowding in the neighborhood of the displacement. We have just completed a large scheme of 15 acres, displacing 5000 people at a loss of £300,000. It is not usually possible to rehouse more than one half the persons displaced. The other half crowd other places. We have come to the conclusion that it is more satisfactory to use the law severely as far as closing insanitary houses is concerned, and to get the law so amended that it will be illegal to rebuild any house worn out or burnt, unless it is put back 20 feet from the center of the road (sidewalk). This will prevent the perpetuation of our slums. Time will do the rest. . . .

"We are trying to deal with overcrowding by decentralization, that is, by increasing cheap and quick means of transit to and from the suburbs. If we are successful, it will help us very much toward solving the pressing problem, as land is comparatively cheap away from the center. We find that disease, crime, and death are in proportion to the number of people in a given area."

As to what can be done now:

"Mr. Riis makes the suggestion that 'tenements may eventually have to be licensed, as now the lodging-houses are, to hold so many tenants and no more, or the State may have to bring down the rents that cause the overcrowding by assuming the right to regulate them as it regulates the fares on the elevated roads.'"

(See also SLUMS; POVERTY; CITY; MUNICIPALISM; SINGLE TAX; SOCIALISM.)

TEXTILE INDUSTRIES.—(For the early developments of the textile industries, see FACTORY SYSTEM; MANUFACTURES; MACHINERY.) In 1860 the capital invested in textile industries was \$150,080,852. In 1890 it was \$739,973,661, an increase of 393 per cent., while the product increased from \$214,740,614 to \$721,949,262, or 236 per cent. Eighty-nine per cent. of the textile industries of the United States are in New England and the Middle States, 50 per cent. in New England. The importance of the industry in value and quantity of product excels that of any other industry. Cotton (*q.v.*) is the most important part of the industry. In 1860 there were 1091 establishments manufacturing cotton, and in 1890 only 905, yet the average number of spindles per establishment had increased from 4799 to 15,677, and the average product from \$106,033 to \$296,112.

The capital invested in the United States on the different branches of the woolen manufactures was, in 1860, \$38,814,422, and in 1890 \$245,886,743. The looms and spindles increased from 16,075 and 639,700 to 69,658 and 2,793,147 respectively. The number of establishments increased 217. There were, in 1860, 213 establishments engaged in making carpets, with a capital of \$4,721,768 and a product of \$7,857,636. In 1890 there were only 173 establishments, with a capital of \$38,208,824, a product of \$47,770,193. Forty-six per cent. of this industry is located near Philadelphia. In 1850, in wool, hosiery, and cotton factories, women furnished 57 per cent. of the employees; in 1890, 48 per cent. The industry passed out of the home stage about 1830 and entered the factory stage, where American girls largely worked. To-day, English and French Canadian workmen are the rule. The hygienic condition of the factories has much improved. Wages in cotton factories were about 44 cents a day from 1820-30; about 90 cents from 1830-50; \$1.03 from 1850-60. In 1873 they were \$1.49; in 1891, \$1.24. In woolen mills wages were \$1.12 before 1830; 86 cents in 1860; \$1.28 in 1873, and \$1.38 in 1891. (See WAGES.) Labor organizations began in the textile trades soon after the development of textile factories, and have played a large part in the American labor movement, especially in the agitation for shorter hours. (See SHORT-HOUR MOVEMENT.) Strong local unions have been developed, however, rather than large national unions. There is, however, a National Cotton Mill Spinners' Association of America and a National Union of Textile Workers. The spinners' union at Fall River is one of the strongest in the country. In England, the strongest textile unions are the Amalgamated Association of Operative Cotton Spinners, the Northern Counties Amalgamated Association of Weavers, and the Amalgamated Association of Card and Blowing Room Operatives. An International Textile Federation is being agitated in Europe.

THOMPSON, ROBERT ELLIS, was born near Lurgan, in the north of Ireland, in 1844, and emigrated to America with his parents in 1857. Graduating at the University of Pennsylvania in 1865, he received the de-

gree of M.A. in 1868, and was chosen instructor in the university in that year, and Professor of Social Science in 1871, and transferred to the professorship of History and English Literature in 1881. In 1892 he was elected Professor of History and Literature in the Wayne Institute of Science. He has lectured on protective tariffs in Harvard, Yale, Princeton, Cornell, Amherst, Williams, and other colleges, in the first two by appointment of the corporation. His main works are: *Social Science and Natural Economy* (1875), partly rewritten as *Elements of Political Economy* (1882); *Protection to Home Industry* (1886); *The Divine Order of Human Society* (1892). He belongs to the economic school of Henry C. Carey. Professor Thompson has edited the *American Presbyterian* (1866-70); the *Pennsylvania Monthly* (1870-81); the *American* (1880-91); the *Sunday-School Times* (1891). He also edited the first two volumes of the *Encyclopedia Americana*. He is an ordained minister of the Presbyterian Church.

THOREAU, HENRY DAVID, was born at Concord, Mass., in 1817, his father being a small farmer and pencil-maker. In 1837 he graduated at Harvard College and returned to Concord as a private tutor, and as a school-teacher. He became intimate with Emerson, being at times an inmate of his home. He was soon a characteristic member of the then new transcendental school. He supported himself by teaching school, by pencil-making, surveying, carpentering, and painting, making every year pedestrian excursions through the woods of New Hampshire. He was eccentric in his dress, manners, and mode of life; and, it is said (tho it is also denied), never went to church, never voted, and never paid a tax to the State. In 1845 he built for himself a wooden hut in the woods by Walden Pond, and continued to live there—a cultured hermit—for two and a half years. After 1849 he lived at home with his parents and sister in Concord. In 1859 he became acquainted with John Brown, and was so influenced by him as to devote his life to the anti-slavery movement till his death in 1862. He combined high culture with the quick instincts, discernment, and love of nature of an Indian. He was a scornful enemy of every custom not based upon nature, reason, and morality. His only works published in his lifetime were *A Week on the Concord and Merrimac Rivers* (1849); *Walden* (1854), but kept a voluminous journal and wrote many essays, from which large selections have since been published.

THORNTON, WILLIAM THOMAS, was born at Burnham, Eng., in 1813, and educated at the Moravian settlement at Ockbrook, near Derby. He was secretary to the British Consul-General at Constantinople, 1830-35, clerk in the India House, London, 1835-58, secretary for public works in the India Office till his death in 1880. His main works were *Over-Population and its Remedy* (1845); *On Labor: its Rights and Wrongful Claims, its Actual Present and Possible Future* (2d ed., 1869).

THRIFT has been recently called "an eclipsed virtue." It is, perhaps, by many to-

day too much condemned, as it was once by most too much praised. In the period when an unbalanced and doctrinaire individualism prevailed in economic thought, the only true help was thought to be self-help. The only abiding way to help the poor was to teach them to help themselves. Under this belief the virtue of thrift was continually exalted by those anxious to remedy poverty. It was shown how, on exactly the same incomes, thrifty persons could manage to get along in comparative comfort, while those without thrift could not get along at all. The inference was that the only way to enable the poor to prosper was to teach them to be thrifty. "A penny saved is a penny earned;" "Frugality is a vast revenue"—these were the lessons taught. It was shown how wise and prudent it was to save and stint, and then invest one's small savings, and so gradually acquire a competence, or at least provision for old age or a rainy day. Penny savings-banks, post-office savings-banks, various provident institutions were founded to encourage thrift.

On the other hand, extreme socialists and trade-unionists have been wont to condemn thrift. Many socialists argue that the laborer under competition can only get a living, and that if by thrift he is enabled to live cheaper, he will simply be enabled to work for lower wages. Trade-unionists put the same view usually thus: "Wages depend on the standard of living. The laborer gets, as in all cases of value, just what it costs to produce him. Cheap laborers make low wages. As thrift means cheap living, it is an evil to the laborers as a class, tho it may enable one who practises it to get the advantage of his fellows."

Mr. Hyndman, before the British Labor Commission, argued that to accumulate money in any way is to accumulate orders on other men's labors, and not to benefit the class who so save. All thrift on the part of the working classes, he held, by making them small capitalists, and intensifying competition, increases the evil (*Minutes of Evidence Digest*, p. 23). According to Mr. Eax: "To the socialist labor is an evil to be minimized to the utmost. The man who works at his trade or avocation more than necessity compels him, or who accumulates more than he can enjoy, is not a hero, but a fool" (*The Religion of Socialism*, p. 94). According to John Burns, before the Trade Union Congress at Norwich, "Thrift was invented by capitalistic rogues to beguile fools to destruction" (*Report*, p. 55).

The balanced view between these extremes of praising thrift as the one thing needful to prosperity and of condemning it as an evil, is to show that there is truth on both sides. Self-help is not the only necessary help. Cooperation is necessary. Thrifty, competing individuals may lower their wages by thrift; but thrifty cooperation or socialism will not lower wages, and yet will save much for the individual and the community. The rich as a class are much more thrifty than the poor. Waste is never wise. The need is for a thrifty cooperative community.

Probably, however, the poor lack in thrift mainly because they lack in the means of education. Girls brought up in tenements, early

taken from school or from home, and sent to factory or store, have little chance to learn thrifty, tidy housekeeping like the well-to-do. Boys with little training at home and less at school rarely learn thrift. The need is for better homes and better education. Socialism may lead to thrift, which it now denounces.

THÜNEN, JOHANN HEINRICH VON, was born in 1783, the son of a landed proprietor, and became himself the owner of a large estate near Rostock. Political economy was his favorite study, and in 1826 he published the first volume of his *Der Isolirte Staat*. It is still a matter of debate how far Von Thünen was a socialist, but many of the opinions to which he gives expression are of a decidedly socialistic nature. Von Thünen's inquiries led him to the conclusion that the wages of a laborer only cover the cost of his maintenance, and the interest on the capital employed in his bringing up; for his labor, his exertion, he receives nothing but his life—*i. e.*, his necessary subsistence. Von Thünen thinks that the only way to raise the wages of labor is to increase the cost of bringing up the laborer, and thus he advocates the better education and training of the workman's children, the requisite cost being regarded as an indispensable need.

TILLET, BENJAMIN, was born at Lower Easton, Bristol, Eng., in 1860. As a boy he had to shift for himself, and roughed it in coal-pits and brick-yards and shoe-shops until he was 14, when he went to sea. He spent three years in the merchant service and two years in the navy, at the end of that time returning to London. By obtaining employment as a tea cooper he was brought into direct contact with dock and wharf work, and experienced the evils of irregular employment. In 1887 he was one of the most active in organizing the Tea Coopers' and General Laborers' Association, and later in organizing the London dockers. (See **DOCKERS' STRIKE**.) Mr. Tillet was elected and has since been general secretary of the Dockers' Union. He is a "progressive" trade-unionist, has been nominated for Parliament by the Independent Labor Party, and has been chosen an alderman of the London County Council.

TOCQUEVILLE, ALEXIS CHARLES HENRI CHEREL DE, was born at Verneuil, France, in 1805. He studied law and became an assistant magistrate. In 1831 he was commissioned to investigate the penitentiary system of the United States. In 1835 he published his famous *De la Démocratie en Amérique* (4 vols., 1835-40). In 1848 he was elected to the Constituent Assembly. In 1849 he was Minister of Foreign Affairs for four months. In 1856 he published his *L'Ancien Régime et la Révolution*. He died at Cannes in 1859. An opponent of democracy, he foretold its growth in the world, and became one of its first historians. We give two typical quotations from his book.

"Democracy," says De Tocqueville, in a remarkable passage (vol. ii. chap. xx.), "is favorable to the

growth of manufactures. . . . Manufactures may possibly, in their turn, bring men back to aristocracy. . . . In proportion as the principle of the division of labor is more extensively applied the workman becomes more weak, more narrow-minded and dependent. The art advances; the artisan recedes. On the other hand, in proportion as it becomes more manifest that the production of manufactures is by so much the more cheaper and better as the manufacture is larger and the amount of capital employed more considerable, wealthy and educated men come forward to embark in manufactures. . . . In a short time the one will require nothing but physical strength without intelligence; the other stands in need of science and almost of genius to secure success. This man resembles more and more the administrator of a vast empire—that man a brute. . . . Hence it would appear, on searching to the bottom, that aristocracy should naturally spring out of the bosom of democracy. . . . The manufacturing democracy of our age first impoverishes and debases the men who serve it and then abandons them to be supported by the charity of the public. This is a natural consequence of what has been said before. Between the workman and the master there are frequent relations, but no real relationship. I am of opinion, upon the whole, that the manufacturing aristocracy which is growing up under our eyes is one of the harshest which ever existed in the world; but at the same time it is one of the most confined and least dangerous. Nevertheless, the friends of democracy should keep their eyes anxiously fixed in this direction, for if ever a permanent inequality of conditions and aristocracy again penetrate into the world, it may be predicted that this is the channel by which they will enter."

De Tocqueville's final conclusions as to the effect of democracy upon social conditions in America is strange reading to-day. He says, in part, "great wealth tends to disappear, the number of small fortunes to increase; desires and gratifications are multiplied, but extraordinary prosperity and irremediable penury are alike unknown. The sentiment of ambition is universal, but the scope of ambition is seldom vast. Each individual stands apart in solitary weakness, but society at large is active, provident, and powerful; the performances of private persons are insignificant; those of the State immense. There is little energy of character, but manners are mild and laws humane. If there be few instances of exalted heroism or of virtues of the highest, brightest, and purest temper, men's habits are regular, violence is rare, and cruelty almost unknown."

TOLSTOY, COUNT LEO, was born September 9, 1828, at Yasnaia Poliana, a village and estate belonging to his mother's family, and situated near the city of Toula, in Russia. His family has been intimately associated with the history of Russia for two centuries, and ranks among the higher nobility. He studied at the University of Kazan, and in 1851 took a commission in the Army of the Caucasus, seeing active service there, and later taking part in the defense of Sebastopol. It was at about this period that he published his first novels, including *Childhood, Boyhood, Youth, The Cossacks, and Sebastopol*. At the close of the Crimean War he made St. Petersburg his home, and became a distinguished member of the literary society there. After three years of this life he traveled extensively aboard, and on his return settled upon his native estate, became a justice of the peace, and applied himself to the organization and management of schools for the peasants, now just released from serfdom. He also edited a paper devoted to popular education. After further travel he married at the age of 34, and made Yasnaia Poliana his permanent home. For 15 years he wrote his novels there, separated almost completely from society, and there his large family were born and brought up. During these years he composed his two greatest works of fiction, *War and*

**Industrial
Servitude.**

Peace and Anna Karénina, which place his name among the most noted in the literature of the century.

It was at the expiration of this period and about the year 1877 that Tolstoy became impressed with the emptiness of his literary pursuits, and began to ask himself what the meaning of life really was.

He began to make a careful study of the four Gospels, and he tells us how, here at last, he succeeded in satisfying himself (*What I Believe*, also called *My Religion*, p. 10). He says: "The text that gave me the key to the truth was St. Matt. 5:39, 'Ye have heard that it hath been said, An eye for an eye and a tooth for a tooth; but I say unto you that ye resist not evil.' The simple meaning of these words suddenly flashed full upon me; I accepted the fact that Christ meant exactly what He said, and then, tho I had found nothing new, all that had hitherto obscured the truth cleared away, and the truth itself arose before me in all its solemn importance." This text, "Resist not evil," seemed to him but the corollary of the Golden Rule; it meant, "Still do good to those that even smite and abuse you."

In his book entitled *Life*, Count Tolstoy gives systematic form to the theory of life which he deduced from the Gospels. He maintains that man should renounce the individual aims of his life and devote his life in love to his fellow-creatures, thus finding his life in doing God's will—that is, in doing unto others as he would have others do unto him, and abstaining entirely from violence. The man who enters upon such a life is really born again, and for him there is no death. In his works, *What to Do*, *The Kingdom of God is Within You*, and others, he shows the conclusions to which his beliefs have brought him. He holds that war, government, private property are to be condemned as involving the use of force; that all men should engage in manual labor; that they should avoid luxury; that all should have an equal right in the land; that money is an evil thing, its chief end being the enslavement of the people, and that a

His Views. life of complete chastity is the ideal toward which men should tend.

His system is thus seen to be a combination of the philosophy of St. John with the ethics of the Sermon on the Mount literally applied.

The *Kreutzer Sonata*, a novel intended to show the author's rigid views upon marriage, was published about the year 1888, and was strangely misunderstood, having been placed under the ban by the Post-Office Department in the United States as unfit for transportation in the mails. In an article written in explanation of this book, Tolstoy declares that eventually love for God and for one's neighbor should replace the physical relations of marriage.

Count Tolstoy's own life gives a fair example of the application of his principles. He has stripped his house of everything not actually necessary. He dresses like a peasant and works in the fields, and has also learned boot-making. He now confines his writing to the elucidation of his moral and religious ideas, and has pub-

lished many short moral stories for the peasants. He has become a strict vegetarian, and never touches wine, tobacco, tea, or coffee. During the famine of 1891-92 he and his family did an extensive work in establishing soup kitchens in the stricken districts. The count has a considerable following in Russia, altho the character of the government in that country makes it difficult to ascertain the real dimensions of such a movement. He has escaped Siberia himself merely on account of his great international reputation.

Tolstoy has been a voluminous writer, and many of his works have been translated into the principal European languages. Among the English translations, besides those already mentioned, may be named *The Four Gospels, Harmonized and Translated*, three volumes, *My Confession*, *Ivan Ilyitch, Family Happiness, Napoleon's Russian Campaign, Power and Liberty, The Long Exile, The Invaders, A Russian Proprietor, Where Love Is, The Two Pilgrims, What Men Live By, Master and Man, Work While Ye Have the Light*. It is to be noted that many of these works are more or less autobiographical, and that even in the novels there is usually a leading character who reflects more or less distinctly the personality of the author. He has also written several plays and some books on education, but these have not yet appeared in English.

ERNEST CROSBY.

TOOKE, THOMAS, was born in St. Petersburg, Russia, in 1774, the son of William Tooke, the historian, and at that time chaplain to the factory of the Russia Company, in St. Petersburg. Thomas Tooke was for more than 40 years successfully engaged in the Russian trade, but is better known as a pioneer in the free-trade movement. He drew up in 1820 a famous "Merchants' Petition" for free trade. He founded the Political Economy Club in 1831, and promoted numerous industrial and philanthropic reforms. He is the author of numerous writings on currency and trade, the best known being his *History of Prices and of the State of the Paper Circulation from 1798-1856*, etc. (6 vols., 1838-57). He died in London in 1858.

TOPOLOBAMPO is the name of a cooperative colony situated in Northern Sinaloa, Mexico, founded by Albert K. Owen, who had obtained valuable concessions from the Mexican Government. A company was formed to develop the colony; its charter was filed in Colorado, and the first colonists were landed in Topolobampo Bay November 17, 1886. An organ of the colony, the *Credit Foncier of Sinaloa*, was started in 1885 in New Jersey and moved to Topolobampo in 1888, edited by Mrs. Marie Howland, and devoted to "integral co-operation." The colonists numbered, in 1892, 446 persons, including 150 children.

The main activities have been the developing of the natural advantages of the colony. Roads have been built, farms opened, a stone pier erected, a canal dug to irrigate 63,000 acres, fruits and vegetables raised, involving the investment of many tens of thousands of dollars.

The main immediately remunerative industry has been a tinware manufactory. Family life has been preserved, and till recently all has been prosperous. Now, however, differences have sprung up. A Free Land Company has been formed to oppose the original Credit Foncier Company, headed by Mr. Owen, and the life of the colony is in doubt.

TORRENS, ROBERT, was born in Ireland in 1780. He became major-general in India, was for years in Parliament, and prominent as a supporter of the Reform Bill. His views on the Corn Laws were finally adopted by Peel. He died in 1864. Among his numerous writings were an *Essay on Money and Paper Currency* (1812); an *Essay on the Production of Wealth* (1821); *The Budget, a Series of Letters on Financial, Commercial and Colonial Policy* (1841-43).

TORRENS LAND SYSTEM.—A system used in Australia to keep the title of lands in a public registry, so that a transfer of titles can be made easily, cheaply, and safely, by simply recording the transfer in the registry. It was adopted in Illinois a number of years ago, but soon declared unconstitutional by the Supreme Court of that State.

TOTAL ABSTINENCE.—See TEMPERANCE; PROHIBITION; PROHIBITION PARTY, GOTHENBERG SYSTEM, SOUTH CAROLINA SYSTEM; NATIONALIZATION OF THE LIQUOR TRAFFIC; LICENSE; LOCAL OPTION.

TOWN (from old English *tun*, enclosure or hedge or farm-house) is a word used, even legally, for any sort of collection of habitations. As a specific term it is used (1) to designate a municipality which is neither a city nor a village; (2) a territorial subdivision which is a unit of local administration. It is so used in New England and in some Western States. In this sense the words town and township are interchangeable. In New Jersey, Pennsylvania, and some other States, the word township is alone used in this sense. In the United States, Federal land statutes, and in the newer Western States, the township is a territorial subdivision, made by the intersection of meridians and parallels, six miles apart and 36 square miles, but is not a political subdivision.

The town idea has reached its main political development in the six New England States. In the Southern States, the county is the local political unit, while in the Middle and Western States a mixed system prevails. In some States the people can adopt the town system if they so vote. In New York, Pennsylvania, and Ohio the county system prevails, but the towns are vigorous subdivisions.

The New England town, with its famous town meeting, is the development of the old Teutonic tradition of largely independent local communities, perpetuated in many parts of England to the days of the Stuarts and brought by the Puritans to New England. In Scotland, the town (pronounced *toon*) is still sometimes used for a farmhouse and buildings; in the north of England, the civil divisions of a

parish are called townships; in parts of Eastern England the chief cluster of buildings in the parish is called the town, but, generally speaking, in England the town means a collection of houses or a city as opposed to the country. The New England town is the political unit that has grown from the communities or settlements planted in New England. Down to 1821 it was the only political unit of New England, and till 1857 it formed the basis of representation in the State assemblies, as it still does in Connecticut. Its area seldom exceeds five square miles, with a population varying from 200 to 13,000, but averaging about 3000. It is governed by an assembly of all its qualified voters, which meets at least once a year and often three or four times. This meeting elects officers and can legislate. Emerson says (*Historical Discourse at Concord*):

Town Meeting.

"In a town meeting the great secret of political science was uncovered and the problem solved how to give every individual his fair weight in the government without any disorder from numbers." Mr. James Bryce says (*The American Commonwealth*, revised edition, Part IV., chap. lxxx.): "The town meeting has been the most perfect school of self-government in any modern country." Jefferson said (quoted by Mr. Bryce, *idem*, Part II., chap. xlviii.): "Those wards called townships in New England are the vital principle of their governments, and have proved themselves the wisest invention ever devised by the art of man for the perfect exercise of self-government and for its preservation."

The officers usually elected are, moderator, town clerk, selectmen, town treasurer, school committee, surveyors of highways, assessors of taxes, collectors of taxes, overseers of the poor, field-drivers, pound-keepers, fence-viewers, surveyors of lumber, measurers of wood, sealers of weights and measures. Most of these officers are elected annually. Money is ordinarily raised by taxation for the following purposes—namely, the support of the public schools, making and repairing highways, the care of the poor, maintaining the fire department, paying the salaries of the town officers, paying for the detection and punishment of offenders against the law, maintaining burial grounds, planting shade trees, providing for disabled soldiers and sailors and their families, and in general for all other necessary expenses.

References: *Johns Hopkins Studies in History and Political Science*, Series 1 to 8; De Wolf's *The Town Meeting* (1890); Bryce's *American Commonwealth*, chap. xlviii. (revised ed., 1895).

TOYNBEE, ARNOLD, was born in London in 1852, the son of a well-known aurist. He spent two years in a military college, but then left and spent a year in a retired sea-coast village in study and meditation. He next went to Oxford and made a notable mark. In spite of ill health he was appointed tutor to the Indian civilians at Balliol College, and for a time immersed himself in economic studies. Deeply interested in the working classes, he went to Whitechapel (East London) and lived, devoting himself to improving the condition of the poor, and taking part in public and religious meetings. Popular with the men, he felt called upon to lecture against Henry George's *Progress and Poverty*, and the strain and excitement of this action on a feeble body, worn by constant

labors, was the immediate cause of his death in 1883. From the inspiration of his example arose Toynbee Hall, founded in 1884. (See UNIVERSITY SETTLEMENTS.) His main work, published in partly unfinished condition, after his death, is *The Industrial Revolution in England*. Neither a socialist nor a democrat, he has strong tendencies in both those directions, and opposes the doctrinaire character of most orthodox economics, and believes that modern facts show the necessity and value of adopting many socialist principles. He was deeply interested in church reform, and desired the harmony of Church and State, his conception of Christianity being the spirit of Jesus applied in all directions.

TRADE-UNIONS. (For ancient and medieval labor organizations, see GUILDS.) Modern trade-unions are societies of working men, usually of the same craft, organized to assist their members in various ways, especially by granting sick, out-of-work, and death benefits, and by combinations to resist reductions in wages and obtain higher wages, shorter hours, and better conditions from their employers.

We consider this subject under five heads: I. Trade-Unions in Great Britain; II. In the United States; III. In Other Countries; IV. Arguments for Trade-Unions; V. Objections to Trade-Unions.

The origin of modern trade-unions is more or less in dispute. The popular theory, adopted by G. Howell (*g.v.*) in his histories of trade-unionism, from a hint in Brentano's *Origin of Trade-Unions* (which hint, however, does not really bear out the inference), is that modern trade-unions are direct descendants from the craft guilds of the Middle Ages. (See GUILDS.) This, however, is almost certainly not the case. According to Mr. and Mrs. Webb's *History of Trade-Unionism* (p. 13), the theory rests "upon no evidence whatsoever. The historical proof is all the other way." Says Brentano (*Guilds and Trade-Unions*, p. 73), "These guilds were not unions of laborers in the present sense of the word, but of persons who with the help of some stock carried on their craft on their own account." (See GUILDS.)

More plausible is the origin of modern trade-unions in the ephemeral associations of wage-earners and journeymen which existed frequently at times during the Middle Ages (see GUILDS), and which were composed of wage-earners and journeymen alone. But a direct connection between even those associations, tho quite possible, has not yet been historically shown. They were too much under the ban of the law to be easily maintained, and above all the apprentice (*g.v.*) system and the whole guild system made too close a connection between master and journeymen to encourage permanent separate associations of working men. About 1700, however, in England a class of employees arose who rarely became masters, and among them the first trade-unions seem to have arisen. We therefore consider first:

I. TRADE-UNIONS IN GREAT BRITAIN.

We shall follow in the main in this portion of our article the valuable *History of Trade-*

Unionism (1894), by Mr. Sidney Webb and Mrs. Beatrice Webb. All through the eighteenth century we have in England the steady development of the capitalist employer, the inability of the worker to own or hope to own the materials and the tools of his craft. As early as 1720 the master tailors complain to Parliament that

"The Journeymen Taylors in and about the cities of London and Westminster to the number of 7000 and upwards have lately entered into a combination to raise their wages and leave off working an hour sooner than they used to do; and for the better carrying on of their design have subscribed their respective names in books prepared for that purpose, at the several houses of call or resort (being public-houses) which they use, and collect several considerable sums of money to defend any prosecutions against them."

Parliament listened, and prohibited such combinations, but the tailors seem to have continued their organization, centering around the "houses of call," for in 1810 a master declared before a select committee that their combination had existed over a century. The Newcastle shoe-makers organized in 1719. The London Sail-Makers' Burial Society dates from 1740. The Glasgow coopers organized in 1752. At Nottingham in 1794, 56 clubs joined in the annual procession. Local friendly societies sprang up everywhere. The rules of over 100 of these, formed between 1750 and 1820, centered around Newcastle-on-Tyne, are in the British Museum. Adam Smith says: "People of the same trade seldom meet together, even for merriment and diversion, but the conversation ends in a conspiracy against the public or in some contrivance to raise prices" (*Wealth of Nations*, Book I., chap. x.). Often a strike ended in a permanent organization. Combinations, however, were illegal, and so were usually disguised as sick and funeral clubs, while perhaps still more often *bona fide* friendly societies gradually came to act as and finally to become trade-unions. The Society of Taylors of London in 1760 says: "It has been an ancient custom in the kingdom of Great Britain for divers artists to meet together and unite themselves in societies to promote amity and Christian charity." But the distinction between employers and employed grew more marked and was vastly increased by the invention and use of machinery in the last half of the eighteenth century. (See MACHINERY; FACTORY SYSTEM.) An American abridgment of William Trant's essay on *Trade-Unions* says of the main instance of machine breaking, the so-called "Luddite Rising,"

"The men were in no humor for reasoning on the principles of political economy. They were starving; and to their eyes the new machinery cut off every chance of their ever working again. They formed the strongest and most secret combination ever known in this country. Their object was to destroy the new machines, and for three years the havoc they committed, especially in Yorkshire, Lancashire, and Nottinghamshire, was immense. It was not until enormous powers were granted to the military, the magistracy, and the police that the conspiracy was brought to an end by the execution of 30 of the ring-leaders."

One effect of the factory system was to some extent to transfer the trade-union centers from the larger cities to the factory districts. The Friendly Society of Iron Founders, which began

**First
Trade-
Unions.**

in 1810, used to meet on dark nights on the peaty wastes and moors on the highlands of the Midland counties, and the archives of the society were buried in the peat. Made illegal by legislation wholly in the control of the wealthy classes, the trade-unions naturally were made more lawless. The masters strenuously resisted; at one time cannon were placed in the Lancashire factories (Schulze Garvernitz's *Social Peace*, tr., p. 87). Usually, however, the opposition was through legislation. Nor was even this often necessary. The masters could trust to competition alone. In 1814 the last vestige of the apprenticeship laws was repealed, and with it any attempt to control wages by law. Competition was now wholly free to reduce wages to the lowest level. It worked its own cure by making labor combinations necessary. (See CONSPIRACY LAWS.) In 1824, owing largely to the efforts of Joseph Hume in Parliament and Francis Place (*q.v.*) out of Parliament, the freedom to organize was partially gained, but even this was materially decreased the next year thro the influence of the masters. Freedom to organize was indeed not wholly gained till 1875, when the last vestige of the combination laws was swept away. In 1834 six harmless Dorchester laborers were sentenced to seven years' transportation on an accusation of playing with oaths in joining a labor union. It produced intense excitement. A petition for their release was signed by 250,000 names, and a demonstration took place in London with a procession of 30,000 men. The Government did not yield until 1836. Thirty years later the public was again aroused against trade-unions on account of the Sheffield outrages, of which Mr. Trant's abridged history says:

"In order to compel men to join their unions and comply with the rules, a system had been adopted of taking away the tools and driving away bands of independent or defaulting workmen. . . . Masters and workmen who refused or failed to comply with their rules were subjected to treatment of the most diabolical character. Their cattle were hamstringed or otherwise mutilated, their ricks set on fire. They were shot at, and in one instance a master was killed by an air gun fired into a crowded room. Gunpowder was usually employed in the case of obnoxious workmen.

Canisters were thrown down chimneys, bottles filled with explosives, to which lighted fuses were attached, were thrown through windows of the workmen's dwelling-houses, thus exposing women and children to its terrible effects. It was a common practice to place gunpowder in grinding troughs, which exploded as soon as work was commenced. In justice to the great body of workmen at Sheffield, it should be stated that these outrages were committed by a very few persons, and were at all times execrated by the great body of the working classes. Out of 60 trade-unions, then in existence, 12 were implicated in these outrages, and of these it was shown on inquiry that the greater proportion of the members knew nothing of the actions of their officers.

"The result of the Sheffield outrages was, that a Royal Commission was appointed in 1867 to inquire into the matter and into the condition of trade-unions generally."

It was the report of this Commission which resulted eventually in the law legalizing trade-unions in 1871, amended in 1875, since which such violence has been unknown.

With this account of the origin of English trade-unions and their struggle for legal recognition their history may be conveniently divided into four periods. The first period, lasting

down to 1825, includes their origin and struggle for recognition. A second period, down to 1842, is called by Mr. and Mrs. Webb "the revolutionary period," when the trade-union movement was dominated by the Owenite movement and the Chartist political agitation. A third period, lasting down to 1880, covers the development of trade-unions into strong trade benefit societies, largely ignoring and sometimes even opposing political action. The last period, reaching to the present, includes the development and then the partial subsiding of the first wave of what is called the new trade-unionism. (See NEW TRADE-UNIONISM.)

The first period we have already considered; the second period really belongs to Owenite socialism and to Chartism (see ENGLAND AND SOCIAL REFORM) rather than to trade-unionism. The Lancashire and Yorkshire textile and building operatives were the pioneers of this phase of the movement. They tried to organize all manual workers into one general and more or less political organization. The Reform Bill of 1832 gave them new hopes. Under the influence of an Irish spinner, John Doherty, a National Association for the Protection of Labor was formed at Manchester in 1830, representing 20 trades. An organ, the *Voice of the People*, was started, and is said to have reached a circulation of 30,000. This association broke up by 1832, but then a builders' union or general trade-union was organized. In 1833 it held a meeting of 270 delegates, representing 30,000 operatives. Meanwhile Robert Owen had still larger plans, and in 1834 he organized a Grand National Consolidated Trade-Union. It was to unite all laborers and to affect national changes, to come upon society "like a thief in the night." Within a few weeks it appears to have been joined by 500,000 members, including tens of thousands of farm laborers and women. No regular dues were required, and the meetings were more or less sensational. According to the *Times* of January 30, 1834, two delegates were seized at Exeter by the police and found furnished with "two wooden axes, two large cutlasses, two masks and two white garments or robes, a large figure of Death with the dart and hour-glass, a Bible and Testament," probably used in initiation ceremonies. It was in connection with this movement that the condemnation of the Dorset laborers, noticed above, took place. The alarm of the Government and of society generally was intense. But the movement did not last; there were a few strikes, easily defeated, and by the end of 1834 the movement collapsed. Apathy followed, until Chartism created a new wave of excitement. In 1836 Lovett and his Working Men's Association commenced their agitation for the "six points" of Chartism, and around this some of the trade-unionism of the day gathered. A despair of constitutional reform led one wing to favor "physical force," and this led to the insurrections of 1839-42. The trade-unions were never, however, a part and parcel of this movement, tho many of their members and a few organized unions did belong to it. No unions contributed to Chartist funds, and the leaders

Owenite
Period.

of the unions were often denounced for their apathy by the Chartists. The virtual collapse of Chartism in 1842 and its final end in 1848 set the unions wholly free to develop their non-political methods. (For the passage of factory laws, the short-hour movement of Oastler, "the factory king," the efforts of Lord Shaftesbury and of others, culminating in the ten-hour act of 1848, see FACTORY LAWS; SHORT-HOUR MOVEMENT; OASTLER.) But after 1842 the unions devoted themselves to building up their own organizations. Those which were

Date of Organizations.

organized before this period now developed their characteristic policy and strength. The Friendly Society of Iron Founders was organized in 1809, but the much larger Amalgamated Society of Engineers was only formed in 1851. The Steam Engine-Makers' Society dates from 1824, the Associated Iron Moulders' of Scotland from 1831. The United Society of Boiler-Makers and Iron Ship-Builders dates from 1832, as does also the Operative Stone Masons' Friendly Society. The Operative Bricklayers' Society was formed in 1848. The Amalgamated Association of Operative Cotton Spinners dates from 1853, the Yorkshire Miners' Association from 1858. The Durham Miners' Association was not organized till 1869. The Amalgamated Society of Tailors appears in 1866, the National Union of Boot and Shoe Operatives in 1874. The Amalgamated Society of Carpenters and Joiners was formed in 1860, and the Northumberland Miners' Mutual Confident Association in 1863. But these dates do not clearly indicate the actual course of events. As a matter of fact, the decade from 1840-50 saw a marked revival of trade-unionism. In 1843 a strong Potters' Union and an active Cotton Spinners' Association was formed, and in 1844 a National Typographical Society. Still more important was the Miners' Association of Great Britain and Ireland, formed in 1841, and under the leadership of Martin Jude, sending out 53 organizers who visited every pit in the kingdom, obtaining, it is said, in 1844 a membership of over 100,000. In 1845 a National Association of United Trades for the Protection of Labor was formed. It was not, however, political, like

The Trade-Union Idea.

Owen's attempts, and with moderation and good management endured 15 years. The unions of this period, as indicated by their names, were largely benefit societies. They expected and sought little from legislation, tho they strenuously fought against legislative oppression. They depended on organizing their own crafts, collecting dues, employing a paid secretary, aiding unemployed members. They fought their employers by strikes, and these tended to grow more orderly and more regulated. Experience taught them the folly of strikes till they were well organized and had collected large funds. They passed numberless by-laws forbidding strikes save with the consent of national committees after due examination. The Amalgamated Society of Engineers formed in 1850, and with William Newton as the prime mover, became the model. Later many trade-union constitutions forbade strikes until efforts at arbitration had

been made. The better organized the unions, the fewer were their strikes.

Mr. George Howell, in the *Contemporary Review*, pointed out that

"In 1882, the Amalgamated Engineers, with an income of £124,000, and a cash balance of £168,000, expended in disputes altogether, including the support they gave to other trades, the sum of £895 only. That was far less than one per cent. of their income. The Ironfounders spent, out of an income of £42,000, £214 only; and the Amalgamated Carpenters, who had had a number of disputes, and had been engaged in strikes, spent £2000 only, out of £50,000, which was only four per cent.; the Tailors, with £18,000, spent £565 only; and the Stonemasons, with 11,000 members in union—the report seems to say more in sorrow than pride—spent nothing in strikes. During six years of unexampled bad trade, reduction of wages, and industrial disturbance, there were a great many strikes, and during that period seven great trade societies expended in the settlement of disputes £162,000 only, out of a capital of nearly £2,000,000."

In the northern provinces, and especially among the miners, the policy was favored of determining wages by agreement with the masters, according to a sliding scale (*q.v.*). The development of strong unions of this sort with large funds and wise management developed, too, the prominent trade-union leaders who have played so large a part in the English movement—William Allan (*q.v.*), of the engineers; Robert Applegarth (*q.v.*), of the carpenters; Daniel Guile, of the ironfounders; Edwin Coulson, of the bricklayers; George Odger, of the shoe-workers; John Kane, of the iron-workers; T. J. Dunning, of the bookbinders. Younger men of the same type, mainly living to-day, are Alexander Macdonald (*q.v.*), Thomas Burt (*q.v.*), of the miners; John Prior, George Howell (*q.v.*), Henry Broadhurst (*q.v.*), George Ship-ton, of the building trades.

These men, however, by no means wholly eschewed politics. As the great amalgamated societies were formed, with their national headquarters usually in London, it threw together some of the strong men named above, who developed somewhat of a political policy. Applegarth, Allan, Guile, Coulson, and Odger thus worked together in an understanding which Mr. and Mrs. Webb have termed a "Junta." They combined a very conservative and cautious policy of building up their own unions, with efforts at gaining such political reforms as the extension of the franchise, amendment of the master and servant law, the mines and factory regulation acts, national education, and the full legalization of trade-unions. They followed, however, no definite economic policy. Allan joined the International (*q.v.*), but subscribed with equal satisfaction to the dogmatic individualism of the English radicals. Only slowly could these men interest their unions in political reforms. In 1874 there was something of a trade-union political movement. Nevertheless, as late as 1882 and 1883 amendments in favor of manhood suffrage were defeated in trade-union congresses by large majorities.

Progress on trade-union lines, however, was steady. Between 1858 and 1867 permanent trade councils began to be formed in the leading centers, composed of delegates from the various local unions. The first permanent committee of the nature of a trades council seems to have been at Liverpool in 1848. By 1860

they were common. The London Trade Council was established in 1861. Out of these councils came the trade-union congresses, now the great British parliaments of labor.

An important special conference was held in London in 1864. The first annual conference was held at Manchester in 1868, and after 1875 became a power. What political action was taken by trade-unionists at this period was usually in connection with the Liberal Party. This grew up naturally as a result of the efforts on the part of the union leaders to gain legal recognition for their unions. It was necessary to use arguments that would appeal to middle-class politicians, since the Tory democracy was not yet progressive enough to endorse trade-unions in any form. The argument that most appealed to the middle-class politicians was the Liberal argument of the freedom of the individual to sell his labor as he pleased—if he wished, individually; if he wished, collectively.

At the general election of 1874 Alexander Macdonald (*q.v.*) and Thomas Burt (*q.v.*) were elected to Parliament as Liberals from Stafford and Morpeth—the first labor members. Seventeen other labor candidates went to the polls at this election, and the miners, ironworkers, and some other unions voted money for campaign expenses. It was this showing of the strength of labor at the polls which made the victorious Conservative Party in 1875 pass the bill finally legalizing labor combinations. Nevertheless, the mass of the trade-unionists had little hope from legislation. The trade-union congresses since 1871 had annually elected a parliamentary committee of 10 men and a secretary, but so doing had left all legislative matters in their hands, and such measures were not even discussed in the congresses. Mr. Henry Broadhurst from 1875-89 was annually elected secretary of the committee without a contest, ceding the post while Under Secretary of State for the Home Department in 1886 to Mr. George Ship-ton, Secretary of the London Trades Council. The policy of the Parliamentary Committee became one of almost pure *laissez faire*, they even opposing attempts to shorten hours by legislation. The unions became in some respects little more than great benefit societies, caring for their own organizations. From 1875-85, say Mr. and Mrs. Webb, the predominant feature in the trade-union world was an extreme and complicated sectionalism. London became less of a trade-union center, and the unions developed in different portions of the country different trade policies.

The last period, beginning about 1880, has seen a change. This has been caused by the appearance of the so-called new unionism. (For a full account of this, see **New Unionism.**) It may be described in brief as the effect of recent English socialism on the trade-unions. The new socialism which began to appear about 1882 made some of the younger men, like Tom Mann and John Burns (*q.v.*), dissatisfied with the conservative and non-political methods of the older unions. The great dock strike (*q.v.*) of 1886 and the match strike, together with the London agitation of

the unemployed, created great excitement, and enabled the younger leaders to organize unskilled workmen in large numbers and come to the trade-union congresses as the representatives of large and enthusiastic unions. The policy of these new unions favored all forms of socialistic legislation, especially the reduction of the hours of labor by law. A Congress of the General Railway Workers' Union in 1890 resolved that "the union shall remain a fighting one, and shall not be encumbered with any sick or accident fund." The delegates of these unions soon had an effect upon the trade-union congresses. At first they were voted down. By 1890, however, a majority in the congress favored the new unionism, and the resolutions kept growing more politically progressive till 1895. This tendency was aided by the formation of the Independent Labor Party (*q.v.*). Since the general election of 1895, however, somewhat of a reaction has taken place. Some of the newly formed unions of unskilled laborers have been broken up or have been materially reduced in numbers. Others have learned that socialism cannot be won in a day. The older and stronger unions have gained new power by making representation in the congresses proportionate to the size of the unions. The congress of 1896 was more conservative, and English trade-unionism has come to a more balanced support both of political and of non-political trade action. At the 1896 congress the resolutions most emphatic favored the reduction of hours to eight, employers' liability, the education of children and the limitation of child work.

The recent statistics of British trade-unions are as follows:

In 1883 there were 195 unions, with 253,088 members; in 1886 the membership was 800,000; in 1893, 1,507,026, or 3.98 per cent. of the entire population. These figures are given by Mr. S. H. Nichols, in Johnson's *Cyclopaedia*. The Seventh Annual Report of the Labor Department of the British Board of Trade gives the following statistics of trade-unions reporting:

Returns were obtained from 687 trade-unions. Of these, 513 were registered under the Trade-Union Act, and 174 were not so registered—an increase of 31 registered and 57 unregistered societies as compared with the number reported in 1892; 97 of the unions concerning which information is published had local sections or branches to the number of 6879 at the end of 1893.

In addition to the unions from which returns were secured, the Labor Department had knowledge of the existence of 118 other unregistered unions at the end of 1893, concerning which no information was obtainable beyond the fact that their total membership amounted to 90,660; there were also 41 other such unions of which information concerning the membership could not be secured.

The following summary shows the total number of members, amount of annual income and expenditure, and balance of funds of all unions for which accounts for 1893 were obtained:

Number of unions for which accounts were received.....	687
Number of members of 677 unions at the end of 1893.....	1,270,789
Total funds of 662 unions in hand at beginning of 1893.....	\$9,258,015
Total income of 687 unions for the year.....	9,718,259
Total expenditures of 687 unions for the year.....	10,032,665
Total funds of 683 unions at end of 1893.....	8,044,055

The discrepancy of \$1046 in the above summary is explained by the statement that two unions, which did not report the amount of their funds at the beginning and end of the year, had an excess of expenditures over income to that amount.

Detailed particulars as to the chief items of expenditure were furnished by 682 unions, and are shown in the following statement :

EXPENDITURES, ETC., OF 682 TRADE-UNIONS, 1893.

ITEMS.	Amounts.	Unions.	Members.
Out-of-work benefits.	\$2,496,160	378	827,840
Dispute benefit.....	3,567,364	331	1,083,904
Sick benefit.....	1,161,823	228	622,908
Accident benefit.....	126,880	99	414,989
Superannuation benefit.....	571,030	89	458,678
Funeral benefit.....	458,385	387	983,834
Other benefits, grants, etc.....	555,570	391	842,202
Grants to other trade-unions.....	299,927	405	996,618
Working and other expenses.....	1,690,919	679	1,269,070
Total.....	\$10,928,076

The discrepancy between the total number of unions making the different expenditures, as shown in the preceding statement, and the total number reporting in reference thereto is explained by the fact that only a limited number of the unions make payments for all the purposes set forth ; and there may have been some unions liable to make certain of the payments which may not have been called on to make such payments during the year.

Concerning the distribution of members by trades in the United Kingdom, Mr. and Mrs. Webb give the following table for 1892 :

TRADES.	England and Wales.	Great Britain.
Engineering and metal.....	233,450	287,000
Building.....	114,500	148,000
Mining.....	325,750	347,000
Textile manufactures.....	184,270	200,000
Clothing and leather.....	78,650	90,000
Printing.....	37,950	46,000
Miscellaneous crafts.....	46,550	59,000
Laborers and transports....	302,880	335,000
Total.....	1,304,000	1,511,000

Of these, 99,650 were women, of whom 80,000 were engaged in textile manufactures, and 8650 in the clothing and leather trades.

Mr. and Mrs. Webb estimate that trade-unionists in Great Britain enroll about 20 per cent. of the adult male manual working class, and in certain counties over 50 per cent. In Northumberland they enroll 11.23 per cent. of the population ; in Durham, 11.21 per cent. ; in Lancashire, 8.63 ; in the London districts, 3.52 per cent.

The larger unions were the Amalgamated Society of Engineers, with 67,028 members in 1890 ; the Yorkshire Miners' Association, 50,000 ; Durham Miners' Association, 49,000 ; Operative Stonemasons' Friendly Society, 32,026 ; Amalgamated Society of Carpenters and Joiners, 31,495 ; Amalgamated Society of Railway Servants, 26,360 ; National Union of Boot and Shoe Operatives, 23,459 ; Amalgamated Association of Operative Cotton Spinners, 18,145 ; Northumberland Miners' Mutual Confident Association, 16,961 ; Amalgamated Society of Tailors, 16,620.

The labor representation in Parliament was : In 1874, 2 ; 1885, 10 ; 1886, 13 ; 1892, 17 ; 1895, 13.

II. TRADE-UNIONISM IN THE UNITED STATES.

The history of American trade-unions may be divided into five periods. 1. A formative period reaching down to about 1840, and including the early ten-hour movement. 2. A period of quiet growth on trade-union lines, accompanied by a wave of Fourierite socialism in the country, and

then the concentration of all interest in the War of the Rebellion ending in 1866. 3. A period of active effort on trade-union lines, reaching to 1878. 4. A period of great strikes and efforts at general organizations, like the Knights of Labor culminating in 1886. 5. The present period of the dominance of the American Federation of Labor.

The beginnings of American trade-unionism are unknown. A strike of journeymen bakers is said to have occurred in New York City in 1741. An association of journeymen shoemakers existed in Philadelphia as early as 1792. There is a tradition that the plan to throw the tea into Boston Harbor was formed in the hall of the ship-calkers. April 3, 1803, an association of shipwrights was incorporated in New York City, and the same year in that city the first notable strike in this country took place among the sailors. In 1806 the tailors and also the carpenters of that city organized. A Compositors' Union had developed considerable strength by 1817. The organization of the Shipwrights' and Calkers' of Boston and Charles-town was incorporated in 1823.

The real formative period, however, of American trade-unionism is from 1825-40. In 1825 Robert Owen's communistic attempt at New Harmony, Ind. (*q.v.*), occasioned widespread social discussion. The same year the *Workman's Advocate*, which Professor Ely believes to be the first American labor journal, appeared in New York City. It was followed by the *Daily Sentinel* and *Young America*, all published by two Englishmen, George Henry Evans and Frederick W. Evans. These papers advocated the freedom of public lands, the breaking up of monopolies, the adoption of a general bankrupt law, a lien of the laborer on his work for his wages, the abolition of imprisonment for debt, equal rights for women and men, and the abolition of chattel slavery and of wages slavery. Over 600 papers are said to have endorsed these demands. In 1830 a working man's convention was held in Syracuse, N. Y., and nominated Ezekiel Williams for governor, giving him 3000 votes, and in 1832 a delegated convention met in the State House at Boston. Prominent points discussed were education, organization, land reform, and most prominently of all the shortening of the hours of labor. A ten-hour movement was adopted. Laborers at that time were employed from 10 to 15 hours per day, and women and children were treated inhumanly. There were many strikes. They mainly failed ; but the agitation went on. April 10, 1840, President Van Buren issued a proclamation establishing the 10-hour system in the United States Government establishments. In 1841 a boat-building firm in Bath, Me., granted the 10-hour day. From 1840-50 a wave of Fourierite socialism swept over the land. Horace Greeley opened the pages of the *New York Tribune* to its advocacy. Phalanxes were established by the dozen. Brook Farm, near Boston, became a Fourierite phalanx. But meanwhile, the organization of labor went steadily on. A New England Working Man's Association was organized in 1845, and its meetings were participated in by men like C. A. Dana, George Ripley, Mr. Brisbane, Wendell Phillips,

W. L. Garrison, Theodore Parker, and others. The first industrial congress of the United States convened in New York October 12, 1845. It laid plans for a secret industrial brotherhood, tho little came of this. Important labor congresses were held at New York in 1847 and at Chicago in 1850. This period, reaching through the war, saw the appearance of most of the present great national trade-unions. The National Typographical Union was organized in 1852, called in 1862 "International," to admit Canadian unions. The hat finishers organized a national union in 1854. The Iron Moulders' Union of North America was founded in 1858 and led to the more important Amalgamated Association of Iron and Steel Workers in 1876. By 1860, 26 national unions were formed. The Brotherhood of Locomotive Engineers started as the "Brotherhood of the

Period of Or- Foot-Board" at Detroit, in 1863. ganization. The Cigar-Makers' National Union followed the next year. The Bricklayers' and Masons' International Union dates from 1865. Central labor unions, too, began to be formed in the larger cities. In New York, a Central Labor Union was formed as early as 1833. A National Labor Union was formed in 1861, but did not endure.

After the war, the return of the soldiers to work and the development of great corporations led to new pressure and to new agitation. Early in the year 1866 the trades' assemblies of New York City and Baltimore issued a call for a National Labor Congress, and 100 delegates, representing 60 labor organizations of all kinds, and covering an area of territory extending from Portland, Me., to San Francisco, met in Baltimore, Md., on August 20, and formed the National Labor Union. This organization, the first national union of all trades, met yearly till 1872, when it nominated presidential candidates, with the result of wrecking the organization in political strife. This and other similar local experiences have led most of the trade-union leaders of to-day to believe in keeping the trade-unions, as unions, out of politics, and tho many, perhaps most, trade-unionists favor socialism as an ultimate, the majority of the leaders oppose committing the unions as unions to avowed socialism now, and especially to the program of the Socialist Labor Party (*q.v.*) or of any other political party. This position has led to a bitter attack upon these leaders, by the leaders of the Socialist Labor Party, and the attempt, in part successful, to capture the trade-union movement for political socialism. The majority of the trade-unions, however, concentrate their efforts on the short-hour movement (*q.v.*). This movement has played a large part in the history of American unions. The philosophy of the movement, sometimes called the eight-hour philosophy, was first adequately formulated by two Boston men, Ira Steward and George E. McNeill (*q.v.*). A Grand Eight-Hour League had been formed previously, but had disappeared, when these two men, with a few friends, organized in the spring of 1869 the Boston Eight-Hour League. It influenced the whole trade-union movement. With the aid of Wendell Phillips and others, they succeeded the same

year in securing the establishment of the Massachusetts Bureau of Statistics of Labor, the parent of all other labor bureaus. The bureau's statistics aided the movement. Agitation for shorter hours became general. There were numerous strikes, many of them successful. In 1874 Massachusetts enacted a 10-hour law for women and for children under the age of 18. In 1868 Congress enacted an eight-hour bill for United States employees. This was ignored, till at last in 1869 another act of Congress secured to all Government employees full compensation for an eight-hour day. To-day eight hours is the rule in Government works.

There were, however, other movements. In 1870 and 1871 some branches of the European International Working Men's Association were formed in this country, but did not take root. From 1868-77 the Order of the Knights of St. Crispin was powerful in the shoe trade. A secret society, the Sovereigns of Industry, attempted about this time to spread cooperative ideas among labor organizations. There were various political labor movements, resulting in little more than agitation. In 1873 an attempt was made to reorganize the National Labor Union under the name of the Industrial Brotherhood. A convention was held, and it called in 1874 an important congress at Rochester, N. Y., where a platform was adopted, drafted by Mr. McNeill, which later became almost without change the famous platform of the Knights of Labor (*q.v.*). This great order was first established as a local secret labor union in Philadelphia, December 28, 1869, the result of the efforts of Uriah S. Stephens and six associates. It gradually spread, but did not hold its first general assembly till January 1, 1878, when Mr. Stephens was chosen General Master Workman. It aimed to unite all working men in one great organization, with the key thought that "an injury to one is the concern of all."

The great railroad strike of 1877, beginning on the Baltimore and Ohio Railroad at Martinsburg, W. Va., and leading to riots and destruction of property in various places, and particularly at Pittsburg, Pa., marks a period in the development of American trade-unions. The rioters were put down, but vast numbers of the people of Pittsburg sympathized with the strikers, and the general attention of the whole country was for the first time drawn to the labor movement. There was a rush into organization. By 1886 the Knights of Labor had a membership of over 500,000. But the growth was too rapid. Reaction set in. In 1885 and 1886 occurred two great strikes on the Gould system of railways south and west of St. Louis, the first successful, the second turning public sympathy against the strikers. In 1886, too, occurred the Haymarket riot in Chicago, the arrest, trial, and, in 1887, the hanging of the "anarchists." It called new attention to the necessity of industrial reforms. Meanwhile a growing dissatisfaction with the Knights of Labor had been developing. That order attempted to mold the men of all trades into one organization, with little or no respect to the autonomy of each craft. Mr. Terence V. Powderly, who had been Gen-

eral Master Workman since 1879, with a General Executive Board, developed dictatorial powers, resulting in the weakening of the order. In 1881 some of the trade-unions organized a Federation of Trade and Labor Unions, which became the American Federation of Labor, at Columbus, O., December 8, 1886. This organization recognizes the autonomy of the separate crafts, but federates them for purposes of strength. Its appearance marks the beginning of the present period. It has become the one great labor organization of the country, and has grown as the Knights of Labor have gone down. Committed from the first to the short-hour movement, in 1889 it voted to make an effort annually to establish the eight-hour day in some one craft. The plan was for some trade each year to strike for eight hours, while all other trades should support that trade. The carpenters were chosen to lead. In May, 1890, they struck in almost all cities, and in many cities gained the day. In 1891 the miners were to strike, but the depressed conditions in their trade and the dual form of their organization prevented any action. This broke up the annual plan. The convention of the federation at Denver in 1894 was marked by the efforts of the socialists to commit the federation to a platform, the tenth plank of which declared for complete socialism. The plank was not adopted, but the socialists succeeded in defeating the reelection of Mr. Samuel Gompers (*q. v.*), who had been president of the federation many years. In the convention of 1895 the socialist element was in a complete minority. Mr. Gompers was reelected president and the convention voted against adopting any political platform and reasserted its adherence to concentration of effort on gaining the eight-hour day. The American Federation of Labor embraces to-day most of the great unions of the country, but not all.

The Knights of Labor, under the lead of Mr. James R. Sovereign, elected General Master Workman upon the defeat of Mr. Powderly in 1892, number a few thousand men. Two new orders have arisen from dissensions among the Knights. The American Railway Union, organized in Chicago in 1893 by Eugene V. Debs, attempts to unite all railway employees in one organization, and has become well known by winning a strike on the Great Northern Railroad in the winter of 1893-94, and still more by its conduct of the great Pullman strike of 1894. (For further account, see AMERICAN FEDERATION OF LABOR.)

Membership in labor unions goes in waves. In times of depression it is difficult for working men to pay their dues, and the number of members in good standing on the books becomes reduced. Such has been

Statistics. the result of the hard times of 1893, but it is among the evidences of the really increased strength of trade-unionism in America that these hard times have not reduced trade-union membership to anything like the extent of former hard times. Mr. Carroll D. Wright (*Industrial Evolution of the United States*, p. 262) puts the membership of the American Federation of Labor at 500,000, of the Knights

of Labor at 150,000; of the American Railway Union at 150,000; of other local and national unions at 600,000, making the total strength of organized labor in America, 1,400,000. This, however, puts the numerical strength of the Knights of Labor, and, to a lesser extent, of the other organizations, considerably too high; tho it must be remembered that this does not measure the complete strength of labor organizations. Joseph Nimmo, Jr., LL.D., of the United States Census Bureau, puts the membership of the American Federation of Labor at 450,000, the Knights of Labor at 75,000, of which only 10,000 belong to the old parent organization (New York *Independent*, May 2, 1895), and claims that labor organizations enroll only 7 per cent. of the people in this country engaged in gainful occupations. According to the census of 1890, 22,735,661 people were engaged in gainful occupations, but of these 3,914,711 were women, two or three millions more were children *or youths*; some thousands were of the employing class. The 1,000,000 members of labor organizations represent, therefore, a large proportion of the working men, and especially their *concerted strength*. The rest are unorganized. It is easy to see, therefore, how organized labor can often sway the whole number, at least among the men. According to the *World Almanac* for 1896, the American Federation of Labor embraces 80 national labor organizations, composed of about 7000 local unions, with an aggregate membership of over 650,000, affiliated under the above title and usually acting together, although reserving the right to independent action. It says: "The larger trade-unions, some of which are in affiliation with the American Federation of Labor, are the Brotherhood of Carpenters and Joiners, 60,000; Association of Iron and Steel Workers, 40,000; International Typographical Union, 40,000; Bricklayers' and Stone Masons' Union, 35,000; Brotherhood of Locomotive Engineers, 32,000; Cigarmakers' International Union, 30,000; Iron Moulders' Union of North America, 30,000; Brotherhood of Locomotive Trainmen, 25,000; Brotherhood of Locomotive Firemen, 22,000; International Association of Machinists, 20,000; United Mine Workers of America, 20,000; Journeymen Tailors' Union of America, 20,000." This perhaps shows the relative strength, but the actual numbers are probably far too high for most of these unions, if members in actual good standing are alone counted.

III. TRADE-UNIONS IN OTHER COUNTRIES.

The following statistical and other facts as to trade-unions in continental Europe and in Australasia are mainly derived from the reports on the respective countries of the (English) Royal Commission on Labor, under date of 1893.

In France, all industrial organizations, whether of employers, of employees, or of both are called *syndicats*. Organization of trade-unions of the English type was late in France. (For the history, see FRANCE AND SOCIAL REFORM.)

In 1884 complete freedom of organization was gained. July 1, 1892, there were 1589 workmen's syndicates with 288,770 members. There were also over 100 syndicates of employers and employed, and nearly 900 agricultural syndicates.

Paris, Lyons, Marseilles, and the Department of Nord are the main centers. French trade-unions are more formally identified with the socialist movement than English and American unions (See SOCIALISM.) Of the 1589 unions, only 379 have benefits, 176 labor registries, and 70 out-of-work funds. The entrance fee is usually 1 fr., and the monthly dues from 50 c. to 1 fr. Paris has 222 workmen's syndicates with some 89,000 members. The *Chambre Syndicale Typographique* is one of the oldest in Paris, founded in 1839. It has 2500 members, a library, newspaper, and benefit funds. The railway employees have two large syndicates with 15,000 and 7000 members. In France, the organizations of miners are the largest, with 41,709 members. Engineering, iron-works and foundries have 36,069; textiles, 31,544. (See also FRANCE; AGRICULTURE; COOPERATION.)

In Germany, trade-unions (*Gewerkvereine*) are mainly socialistic, as in France, tho there are some that are not. The old medieval guilds (*Zünfte*) were abolished by various laws at the close of the last century and the beginning of this; but modern guilds (*Innungen*), mainly of employees, and somewhat patterned after the old, were developed, and were encouraged by the Government, which strictly controlled all trade. Trade-unions proper date from 1868. Herr Fritzsche had established a German Union of Tobacco Workers in 1865, and of German printers in 1866. These were socialistic, and in 1868 the followers began to start various trade associations (*Gewerkschaften*). Dr. Max Hirsch the same year started a movement to copy the English trade-union idea. He and Herr Duncker worked together, and by 1869 had formed four such unions. In 1892 there were 244,934 persons enrolled in the socialistic *Gewerkschaften* in 57 central organizations, the miners, metal-workers, cabinet-workers, and printers being the most numerous. Twelve of the 57 central organizations give out-of-work pay, and 33 furnish traveling money. Dues average 9½ marks per year. They have 56 papers, with a circulation of 220,000. Of the *Gewerkvereine* (or trade-unions proper) there were, in 1893, 1341 local unions, with 61,034 members. Engineers and metal-workers lead. There are sick, death, and out-of-work benefits, etc. The printers' union we have said was established by Herr Fritzsche, but he rather reorganized a union that can be traced back to the seventeenth century. It is like an English trade-union, yet socialistic.

In Switzerland, societies to represent the interests of workmen in various ways, such as establishing benefit funds, savings banks, technical schools, etc., are old, tho not trade-unions proper. The *Société d'Utilité Publique* of Basle dates from 1777. It has some 2000 members and a capital of \$40,000. It has founded 54 institutions of some kind. The *Société Suisse d'Utilité Publique* dates from 1810. The great Swiss labor society, however, is the *Grütliverein*. It takes its name from the scene of the original pact in 1307 between the forest cantons. Founded at Geneva in 1838, it had, in 1893, 352 branches, 15,241 members, and a reserve fund of \$70,000. It is both industrial

and political, and largely socialistic. Owing to its agitation in 1886, a federal officer, called the workman secretary, is elected every three years by a congress of Swiss labor societies, organized as a federation, and he represents the societies in the Government. He is paid by the Government. Trade-unions proper are less developed in Switzerland. The Federation of Workers in Wood has 2000 members. The Printers' Trade Federation is older, with 1211 members. In all the Swiss Trade-Union Federation has 12,000 members in 253 branches. (See SWITZERLAND.)

In Italy, labor organizations are of very various kinds. Some are very ancient. The Pious Union of Journeyman Printers of Turin dates from 1710. The Pious Institute of Silk and Felt Hat Makers of the same city dates from 1738. In 1861 a *Fratellanza Artigiana* was started at Florence, and is still strong. In 1871 a *Patto del Fratellanza*, or pact of working men's societies, was formed at Rome. Both of these were under the influence of Mazzini. Since then most Italian labor organizations are best considered under the head of socialism. - (See ITALY.)

In Austria, the history of trade-unions is identified with the political history and socialism. (See AUSTRIA.) There were, in 1893, 148 trade-unions and political associations, 143 benefit societies, 296 mutual improvement societies. On Christmas Eve, 1893, the first congress of Austrian trade-unions met in Vienna; 270 delegates were present. They reported 20,000 members of unions in Vienna and 11,320 in the provinces. (See AUSTRIA.)

In Belgium, trade-unions have long had a firm hold, some of them being descended from the old trade benefit societies, but at present are mainly socialist societies, and are best considered under that head. (See BELGIUM.) In Holland there are many working men's associations, but not many or strong trade-unions proper. In Denmark, Sweden, and Norway, as in Belgium, the trade-unions are practically socialist societies. Denmark has some 400, with a membership of 35,000. In Russia, trade-unions in the Western sense are unknown, but there are artisans' guilds in the cities and in the provinces (*artels*, or societies of laborers) for various cooperative purposes. In Australasia, naturally, trade-unions have followed the English model. A branch of the English Amalgamated Society of Engineers was established in Australia in 1850. In New South Wales alone there are over 100 unions, with from 50,000 to 60,000 members; in Victoria, 70 unions, with from 25,000 to 30,000 members. Entrance fees vary from 1s. to £2. In the Amalgamated Society of Engineers it is £3 10s.; fees vary from 6d. a month to £1 a year, more commonly 6d. a week. Most of the unions have benefit funds.

IV. ARGUMENTS FOR TRADE-UNIONS.

The first argument for the existence of trade-unions is that they are necessary to protect the individual employee. For capitalists organized in great corporations to refuse to allow their employees to organize is injustice.

Trade-unions are necessary to allow of arbitration, conciliation, and responsible, enduring relations between workmen and their employ-

ers. Boards of arbitration and conciliation cannot deal between employers and each of several hundred employees acting as individuals. In England the large employers have learned to prefer to deal with *strong* trade-unions. Then responsible bargains can be made for a year ahead between the masters and the men, and the men and the corporations can know what to count on in fixing their prices.

Says Schulze Garvernitz (*Social Peace*, tr., pp. 248-250):

"The more intellectually gifted employers in the most important English industries have given an ungrudging recognition to the unions, and comparing the present with the former state of incessant strife, they see in the trade-union movement the instrument which is to restore English industry to the paths of peace." He quotes David Dale, a prominent mine owner, as saying: "Let me therefore declare emphatically, as the result of long and varied experience, that the best securities that employers can have for the rule of reason and the observance of engagements on the part of the operatives of any trade is that those operatives should have among themselves a union strong in numbers and with an able and trusted executive."

Says Professor Alfred Marshall, in a carefully balanced estimate (*Economics of Industry*, Book VI. chap. xii., § 13):

"Little but mischief indeed comes from a weak union, always ready to interfere, but seldom able to secure the faithful carrying out of an agreement, to which its own officers have been a party. But a strong union, guided by able and far-seeing men, who have a grave sense of responsibility, is found to enable a few minutes' quiet conversation to settle innumerable petty disputes that in old times would have caused much delay and worry and loss of mutual good feeling."

Mr. Potter Palmer, of Chicago, is reported to have said:

"For ten years I made as desperate a fight against organized labor as was ever made by mortal man. It cost me considerably more than \$1,000,000 to learn that there is no labor so skilled, so intelligent, so faithful as that which is governed by an organization whose officials are well-balanced, level-headed men. . . . I now employ none but organized labor, and never have the least trouble, each believing that the one has no right to oppress the other."

Invention and machinery make trade-unions and short hours necessary. Since the war muscular labor has been replaced by machinery (*g.v.*) in different trades from 50 to 300 per cent. This process is going on continually. Type-setting machines are to-day discharging thousands of compositors. It occasions terrible, if temporary evils. Trade-unions are then often the only bulwark between the wageworker and terrible reductions in wages. They are also the only hope of steady, orderly solution of the labor question. In trades where labor is well organized there are high wages, and peace and hope.

The best argument for trade-unions is the simple statement of what they have done. Mr. Trant (as above), summing up what they have done in England, says:

"It has been argued: First, that trade-unions have succeeded in raising wages and reducing the number of working hours. Second, that these reforms do not benefit the laborer at the cost of either the capitalist or the consumer; as, between certain limits, it is found that high pay and the prospect of an early cessation from work are such incentives to industry that the produce of labor is actually greater than under a system of long hours and low pay. Third, that the workmen have such confidence in the benefits they derive from union, that, after the experience of 'half a millennium,' they are crowding into societies, into unions, in a greater ratio every year. Fourth, that their de-

clared object is to prevent strikes and substitute arbitrations; and altho the latter mode of settling disputes is often proposed by the men and refused by the masters, it is seldom proposed by the masters and still less often refused by the men. It has been argued, further, that such being the objects of trade-unions, and such their success in obtaining those objects, the influence of that success must be very beneficial. First, because high wages mean increased comforts, which are not only a social, but a commercial advantage. High wages mean increased production, also the double blessing just mentioned. Second, because high wages do not mean enhanced prices, but the contrary. Third, because the principles of trade-unionism teach men the prudence of denying themselves something to-day, in order that they may have greater advantages to-morrow; and the duty of self-sacrifice, by calling upon them to contribute, out of their meager wealth, toward the alleviation of the sufferings of their fellow-men. Fourth, because trade-unions endeavor to obtain for the working classes more leisure for recreation and study. Fifth, because by lectures and other means the unions endeavor to make their members better workmen; and by rules which stigmatize and punish the idle, the vicious, and the incompetent, do all in their power to make workmen better citizens.

"It is really difficult to conceive how an institution with such noble objects, having attained those objects, can be anything but a great blessing to the community in which it is placed."

In the United States trade-unions have produced the same results.

1. They have shortened hours of toil from 13, 14, and occasionally 16, 75 years ago, to 12, 11, 10, and even to 8 in very many trades to-day. This is almost solely due to trade-unions, and has not taken place in portions of the country or in trades where trade-unionism is weak. The average hours of labor are yet said to be 11½ in all trades, because many are unorganized.

2. Trade-unions have mainly contributed to a general rise of wages.

3. Trade-unions have prevented an unknown number of cut downs in wages.

4. Trade-unions have gained in many States, legislation preventing the truck system, the locking of factory doors in work hours, the employment of women and children at night, etc.

They have gained legislation protecting the life and limb of employees from unguarded machinery, compelling the erection of fire-escapes, appointing factory inspectors (men and women). They have helped or led in establishing evening schools, labor bureaus, boards of arbitration and conciliation. They have caused to be enacted laws compelling weekly payment of wages, exempting the wages of wives and children from attachment, defining the responsibility of railroad and other corporations for accidents to their employees, above all *limiting the hours* of labor of women and children.

Such laws have not been passed in all States, nor are they wholly due to trade union efforts; but they have scarcely ever, if ever, been passed where trade-unions are weak, and in almost all cases it has been trade-union leaders who have attended the legislative hearings, collected the witnesses and conducted the agitations that have resulted in these laws.

5. The chief benefit of trade-unions is implied in the above, *viz.*, their educational effect. It is said above that good trade unions do good and poor trade-unions do harm, but good trade-unions usually come as the outgrowth of poor and weak trade-unions. Therefore even poor and weak trade-unions are to be encouraged and made strong and good as soon as possible.

6. Trade-unions have been of inestimable use

to the working classes as benefit societies. Of the extent to which trade-unions are insurance companies and employment bureaus, the general public has little idea. The Cigarmakers' International Union in 10 years (1882-91) disbursed \$1,446,996. Of this only \$676,456 went

**Trade
Benefits.**

for strikes and aiding weak unions (only a portion of that sum, therefore, for strikes); \$476,931 went for sick benefits; \$130,774 for death benefits; \$43,984 (in two years only) for out-of-work benefits; \$382,839 was loaned to traveling members in search of work; \$373,859 was added to the reserve fund. The United Brotherhood of Carpenters and Joiners, formed only in 1831, in seven years (1886-92) spent \$457,966. Of this only \$143,296 went for strikes, and \$210,213 for sick and death benefits. Yet their strikes have paid. Mr. P. J. McGuire, their general secretary, reports in four years (1889-92) 523 strikes, 23 lost, 24 compromised, and 476 successful; 99 were for higher wages, 71 for the eight-hour day, 316 for a nine-hour day, 31 for lesser hours Saturday. Speaking of 11 years' struggle, he says that while wages were \$1.50 to \$2.50 per day, they are now \$2.25 to \$3.50. In 531 cities they have forced wages up, gaining for the men, Mr. McGuire estimates, nearly \$1,500,000. The International Typographical Union in three years (1890-92) spent \$196,688: \$83,734 for strikes, \$11,500 for death benefits, \$52,158 for the Childs-Drexel Printers' Home. Besides this, the local unions spend much more for sick benefits. Union No. 42 (of Minneapolis) spent in the year ending March 31, 1892, \$2797: \$749 for sick benefits, \$517 to help other unions, \$399 for death benefits, \$151 for a cemetery reserve fund. The International Furniture Workers' Union, a comparatively small union, spent in 15 months, January 1, 1892, \$20,760: \$5835 for sick benefits, \$2250 for death benefits, \$283 for fire losses, \$5835 for strike benefits. These statistics are taken from the report of the Bureau of Labor Statistics of Minnesota for 1891-92. Says the report: "Organized workmen make mistakes and failures, . . . but these failures and mistakes are no more a valid argument against trade-unions than against insurance companies, banks and other business corporations. Over three fourths of the standard investment life insurance companies started in the United States have gone out of business. . . . The failures of trade-unions do not approximate these figures." The report shows that most trade-unions conduct their business more cheaply than most insurance companies. It says: "The oldest unions have developed systems of accounts and methods of book-keeping for their affairs which, for perfection and adaptability to the ends to be accomplished, are not excelled in any class of mercantile or manufacturing establishments." Yet of all this quiet work of the trade-unions the public hears very little.

V. OBJECTIONS TO TRADE-UNIONS.

1. It is said that they are tyrannical. On the contrary, they are utterly democratic. In every trade-union, every office, every rule, every strike is voted upon by the members, and the majority prevails. Sometimes a union, after

voting to strike, empowers a walking delegate to call the strike when he thinks best; but the decision to strike does not lie with him. It not unfrequently happens that an employer asks an employee why he struck, and the man says he was compelled to strike by his union. Yet often that same employee himself voted to strike. Employees do not usually tell their employers when they vote to strike. Of course, in a democratic organization, a minority submits to a majority, but this is not tyranny. Sometimes, therefore, some men do strike against their will; but if they did not belong to a union they would have their will more crossed by their employers, so that, tho in a union a man does not always have his way, he has it infinitely more often than the employee who belongs to no union.

2. It is said that trade unions are led by agitators, whose salaries depend on getting up an agitation. This occasionally happens, but very seldom. Trade-unions employ walking delegates for two reasons: (1) To attend to the important beneficiary work of the union; (2) because they have learned that it is necessary to have some one to represent them in dealing with their employers who are not financially dependent upon their employers. This is unquestionably necessary. Employees, especially those with families, are afraid to stand up against their employers. They know that they will be considered as stirrers up of strife, and soon, on one excuse or another, discharged. So trade-unions get some one to represent them who is not afraid of the employer. It is among the rights of any one to act through their representatives, Corporations usually do. Yet no position is more commonly taken by employers than that they will deal only with their own men. The walking delegate does indeed strive to organize and extend the organization of his craft. That is a part of his work and right. But his main work is to visit the sick or pay out the benefits of the order.

3. It is said that trade-unions are mischievous in creating useless strikes. This is, generally speaking, a mistake. (See STRIKES.)

4. It is said that trade-unions lower the efficiency of labor, interfere with personal rights, and create violence by preventing apprentices from learning trades, by demanding equal wages for union members without reference to skill, by interfering with the employer's right to employ whom he will, and demanding that he employ only union labor, and by attacking non-union labor in time of strikes.

**Trade-
Unions
and Non-
Unionists.**

To these objections, it is to be frankly admitted, that cases of injustice on the part of trade-unions do frequently happen, especially with weak and newly formed unions; but this is not because of trade-unionism, but because the members are ignorant and unwise, and therefore have more need of unions which gradually outgrow such evils. Says Professor Marshall (*Economics of Industry*, Book III., chap. v., § 3):

"In many of the smaller unions there remains to the present day much of the folly and ignorance and selfishness, and a little of the violence of earlier times. But we may trust that those faults which are not now

found in the largest and best-managed unions will, with the course of time and the diffusion of knowledge, disappear altogether. It is true that even the best unions do not always act up to the principles of unionism as they are expounded by their most enlightened members. But as, when dealing with the economics of trade, we do not trouble ourselves to discuss at length the guiles of dishonest merchants; so when dealing with the economics of unionism, we may accept its principles as they are put into practice by the most enlightened unionists."

As for violence in times of strike against non-union men, called "scabs" by the union men, it undoubtedly often happens, but very often it is conducted by irresponsible young men or boys, and sometimes women, in hate, or in spirit of mischief, and is not conducted by the unionists. The violence against property in case of strike is almost wholly committed, not by unionists, but by the hoodlums which infest most large cities, and are glad of any opportunity to attack the hated capitalists. Most trade-unions are careful to protect property, knowing it for their interest in the long run. (See STRIKES.) Usually the trade-unions are the best police and teachers of law, order, and discipline. Says Professor Marshall (*idem*, Book III., chap. v., § 13):

"Unions are rapidly growing out of the habit of *racketing*: that is, of hiding, stealing or destroying the tools of an employer or a workman who offends against their rules. There is no sign of the disuse of the habit of *picketing* a place where the men have struck; that is, of surrounding all entrances to it with men appointed to represent the interests of the union; but cases of intimidation on the part of these pickets are become rarer; they now confine themselves almost entirely to explaining to workmen who may be seeking employment, the nature and cause of the strike. The pickets appeal to their feelings of class patriotism, and endeavor to dissuade them from siding with the employers against the employed; offering them on the part of the union the repayment of all the expenses to which they may be put by abandoning their purpose.

Of the complaint that trade-unionists demand equal wages for workmen good and bad, Mr. Trant says (as above):

"That unions force masters to pay bad workmen the same wages as good workmen is not true, and the very idea would be scouted by all sensible unionists. The notion that such is the case is, however, very general. . . . True, the unions sometimes agree upon a minimum rate of wages, but this is quite another thing. If a man be not worth that minimum no employer need employ him, while if he be a man of superior skill, or extraordinary working ability, there is no limit to the amount of wages an employer may feel inclined to give him. Of course, where wages are paid by the day, a uniform rate naturally springs in existence."

Ruskin advocates equal wages. He says (*Unto this Last*, Essay 1):

"'Pay good and bad workmen alike?' Certainly. The difference between one prelate's sermons and his successor's—or between one physician's opinion and another's—is far greater, as respects the qualities of mind involved, and far more important in result to you personally, than the difference between good and bad laying of bricks (tho that is greater than most people suppose). Yet you pay with equal fee, contentedly, the good and bad workmen upon your soul, and the good and bad workmen upon your body; much more may you pay, contentedly, with equal fees, the good and bad workmen upon your house.

"Nay, but I choose my physician and (?) my clergyman, thus indicating my sense of the quality of their work.' By all means, also, choose your bricklayer; that is the proper reward of the good workman, to be 'chosen.' The natural and right system respecting all labor is, that it should be paid at a fixed rate, but the good workman employed, and the bad workman unemployed. The false, unnatural, and destructive sys-

tem is when the bad workman is allowed to offer his work at half price, and either take the place of the good, or force him by his competition to work for an inadequate sum."

This, in a general and sometimes unconscious way, is what the trade-unionist aims at, and he aims all the more strenuously the more intelligent trade-unionist he is. As for the asserted hostility of trade-unions to apprentices, and their admitted effort to induce or compel employers to employ only union men, it is to be said that trade-unions do not limit apprenticeship to anything like the extent they are accused of doing. (For proof of this, see APPRENTICESHIP.) They do strive to limit the number of workmen, and when the emigration laws admit and employers often import adult workmen from Europe, the only way the unionist can limit the competition which may take from him his living is to limit the number of non-adults learning the craft. This is the explanation of the asserted hostility of American trade-unions to American labor. That unionists do strive to control the number of craftsmen, and above all to induce or force employers to employ only union men, is admitted. But provided they limit themselves to law-abiding methods, as more and more they are doing, this, under the present situation of industry, is undoubtedly their right and their necessity. The workman's craft is his livelihood, and that of his wife and children. The union is well-nigh his only way (see above) of preventing his wages from falling below the level of existence. Almost all economists support him in this. If some ignorant workman or some skilled smart workman does not want to join the union of his craft, it hurts every union man, and in the long run hurts the individual himself. Hence the unionists use every inducement they can to get all workmen to join their union, and to prevent employers from employing non-union labor. It is a life-and-death question to the workman. In seeing the foolish things often done by trade-unions, it must be remembered what might happen were there no trade-unions. The working classes under modern democratic impulses will not quietly be content with low wages. If they are prevented for organizing in legal ways, it is claimed that they would organize in illegal ways, or perhaps develop useless but violent and distinctive uprisings and insurrections. If they did not and there were no unions any unscrupulous employer could lower wages as he would, and force just employers to do the same. It is the fear of unions and of strikes that prevent many cut downs. The union is for the good alike of the wage worker and of the just employer. The following quotations used by trade-unionists in America show the change of opinion:

"Trade-unions are the bulwarks of modern democracies."—*W. E. Gladstone*.

"Were it not for the typographical union the printers of this country would not now be getting what they do for their work by at least one third."—*George W. Childs*.

Says Frederick Harrison (*Nineteenth Century*, October):

"Things are indeed changed now. We have just seen the greatest strike on record carried to a successful issue with and mainly by the support and encouragement of the public. The press, even the party

press, was uniformly fair, and, very generally, aided the movement. No sooner were the docks empty than money poured into the strike fund, not only from thousands of British unions, but from across the seas, and from the wealthy and governing classes in all directions. 'We were pelted with checks,' says the Treasurer, and in a few weeks upward of £40,000 was given. No Mansion House fund in a great national disaster, says John Burns, could have been 'responded to with more extravagant generosity.' In one memorable case, at least, a great employer—Mr. Henry Lafone—himself gave strike-pay to his own men when under a sense of social duty they left his works empty. The Stock Exchange raised a handsome sum toward the fund in a few minutes. Merchants and merchants' clerks cheered the strikers as they passed the warehouses in the city. London saw, without uneasiness or ill-will, 50,000 men on the verge of starvation pass in procession through the street. Politicians, clergymen, writers, and capitalists backed up their demands with word and with purse. Churches of all creeds, educational and charitable institutions, gave their help. Catholics and Salvationists, Tories and Radicals, for once combined. . . . The East End shopkeepers gave credit for goods. The pawnbrokers refused interest, and lodging-house keepers refused their rent. Finally a Lord Mayor, a Cardinal, a Bishop of London, and some prominent politicians, succeeded in bringing about peace in this tremendous upheaval of industry."

5. One objection is brought against trade-unions from a very different quarter from those we have considered above. They are declared

Trade-Unionism and Socialism.

by some socialistic reformers to be reactionary and useless. This objection, as far as it applies to trade-unions, is usually brought by young and utopian middle-class socialists who know very little about what trade-unions are doing. Few working class socialists object to trade-

unions. But very many working-class socialists do attack, and that bitterly, the trade-union leaders. They say trade-unions are necessary to-day, but cannot really solve the labor movement; that only socialism can do that; and that the main use of the trade-union ought to be to educate the workers toward socialism. This, they say, the trade-union leaders prevent because it is for their interest to magnify the organizations which give them a living. Those trade-unionists who refuse to join the Socialist Labor Party they brand as traitors to labor, and as having sold their views to the capitalist class, etc. Says Mr. Hyndman, in *Justice*, the organ of this type of socialism in England:

"The day has gone by for the efforts of isolated trades" (September 6, 1884). "Nothing short of a revolution which shall place the producers of wealth in control of their own country can possibly change matters for the better" (July 13, 1885). "We appeal, therefore, earnestly to the skilled artisans of all trades, unionists and non-unionists alike, to make common cause with their unskilled brethren, and unite with us Social Democrats, so that the workers may themselves take hold of the means of production, and organize a cooperative commonwealth for themselves and their children" (June 13, 1887).

The position of the same type of socialists in America is the same, only with the use of more denunciation. The trade-union leaders, however, even those who do accept the ideals of socialism as their ultimate aim, being usually men of some years of experience, know that socialism at the best can come but slowly. They have seen working-class political movements and labor parties come and go. To identify trade-unions as organizations with such political movements, they believe, would endanger the only organizations that are protecting labor

interests to-day for at the best questionable and vague hopes. Let socialism come, they argue, as speedily as it may; let workers unite and vote for it, if they will, as members of a political party; but let us not commit the unions as unions to such parties. They point to the many concrete and very actual advantages trade-unions have gained to-day for the working classes (see above). Many of them do not even believe that as socialists it is the wisest way to work for socialism thro independent political parties. They believe that socialism must come, if at all, as a slow evolution, first of all, through the organization of trades on trade lines, especially working for the shortening of the hours of labor. What socialistic measures the community is ready for they believe can be best obtained, step by step, by working through existing political parties. They are inclined to laugh at working men who cannot control their own trade, and cannot even control one political party, hoping to gain the majority of all political parties.

A last objection to trade-unions, or at least to trade-unions of the present type, which we may briefly consider, comes from the opposite direction—from the extreme individualists. In *A Plea for Liberty* (Thomas Mackay, ed.), Mr. Auberon Herbert, writing on *The True Line of Deliverance*, argues that present trade-unions are wrong so far as they are militant organizations. He says that on the present line they can only succeed by being at least supplemented by State socialism and a vast system of restrictions which he considers opposed to liberty and to the real advantage of the workers. He says:

"The point then that I urge upon trade-unionists and all workmen is the same point I should urge upon nations—seek to get rid of war. . . . Capital, relieved of all attacks and of all misgivings, would become intensely active. The same wise spirit in the men which had led them to abandon all attacks upon it thro their organiza- Individual-
tions would also lead them to put a sharp curb upon the mischievous activities of the politician, and to prevent his happy-go-lucky interference with it. Capital would thus have that sense of complete security which is beyond all value to it. . . . The consequences would be that this country would become the home and storehouse of capital. . . . In two senses the workmen, if they so choose, may become the masters of capital. They may encourage capital to such an extent, that the competition of capitalists will drive the reward of labor up to the highest point and the reward of labor down to the lowest point; and, secondly, being the largest body of consumers, they may have capital at their feet, trying to find out their every will and pleasure. . . . Under this system there would be no unions of exactly the present type, but there would be far more associations among the men. The probability is that almost every man would belong to some form of union. Information would be the first great purpose. . . . The union, being no longer a war machine, would serve many great purposes. One great object that lies before every working man is to have two sources of revenue: his labor earnings and his return from industrial investments. If all the money wasted in labor-war had been invested in industrial concerns, wages would be higher than they are now, and the men would be part owners of a considerable amount of the industrial machinery of the country. . . . Once relieved from the miserable duty of fighting the employer, its [the union's] energies would be called out in many directions which are scarcely in the region of imagination at present."

The answer to this view is the simple one of quoting the facts against it. Where trade-unions have not been organized and capital has

been most secure, as in the sweated trades on the one hand and the great monopolies on the other, wages have not been highest nor conditions best. It is simply history that scarcely a single advance has been gained by labor, save as laborers have organized and aggressively struggled for it. The few reforms that have been brought forward by humane employers were not brought forward till the labor movement called attention to the subject.

Says the late Professor Thorold Rogers (*g. v.*), of Oxford, concerning trade-unions :

"I confess to at one time having viewed them suspiciously; but a long study of the history of labor has convinced me that they are not only the best friends of the workman, but the best agency for the employer and the public; and that to the extension of these associations political economists and statesmen must look for the solution of some among the most pressing and difficult problems of our times."

Professor Marshall says, summing up a more critical study of the effects of trade-unions (*Economics of Industry*, Book VI., chap. xiii.) :

"Other things being equal, the presence of a union in a trade raises wages relatively to other trades. But the influence which unions exert on the average level of wages is less than would be inferred by looking at the influence which they exert on wages in each particular trade. When the measures which they take to raise wages in one trade have the effect of rendering business more difficult, or anxious, or impeding it in any other way, they are likely to diminish employment in other trades, and thus to cause a greater aggregate loss of wages to other trades than they gain for themselves, and to lower and not raise the average level of wages. . . .

"The power of unions to raise general wages by direct means is never great; it is never sufficient to contend successfully with the general economic forces of the age, when their drift is against a rise of wages. But yet it is sufficient materially to benefit the worker, when it is so directed as to co-operate with and to strengthen those general agencies, which are tending

to improve his position morally and economically. And it will be so directed if the following conditions are satisfied. Firstly, unions must aim at making business easy and certain; this is already done by formal and informal boards of conciliation in some trades, especially such as produce largely for foreign markets. Secondly, they must aim at raising the standard of life among the workers of the present and the coming generation by fostering habits of sobriety and honesty, independence and self-respect: this is done in different degrees by all unions; and whatever influence they exert in this direction is cumulative. Thirdly, they must aid as many as possible of the rising generation to acquire industrial skill, and to join the higher paid ranks of labor: this calls for some self-sacrifice, and is inconsistent with any attempt to raise very high the wages in skilled trades by making the entrance to them artificially difficult. Fourthly, they must strive to develop the great stores of business power and inventive resource that lie latent among the working classes, so that, production being economical and efficient, the national dividend may be large; and that, business power being cheap, and the share going as earnings of management being relatively small, that which remains for wages may be high. The training which unionists get from the management of union affairs, though highly beneficial to them as men and as citizens, is yet not exactly what is wanted for this end. . . . Fifthly, they must be always specially careful to avoid action by which one class of workers inflict a direct injury on others. . . .

"Thus union policy as a whole is likely to be economically successful provided unionists as individuals and in their corporate capacity follow the dictates of morality directed by sound knowledge. In this respect unions derive an ever-increasing assistance from public sympathy and public criticism; and the more they extend the sphere of their undertakings by federation and international alliances, the more dependent do they become on that sympathy and the more amenable to that criticism; the larger the questions at issue, the greater is the force of public opinion."

TRAMPS.—In the United States the term *tramp* is in general use as equivalent for a wandering vagrant, and is really synonymous with the word vagrant, tho' the vagrancy laws usually include disorderly persons who would scarcely be called tramps. Vagrancy laws exist in all civilized countries, and began in England as early as the middle of the fourteenth century, when efforts were made to require laborers to stay and work in certain places. (See POOR LAWS.) The laws were continually changed and added to, and the treatment of vagrants was often severe in the extreme.

To-day, vagrants in England are, if simply idle or disorderly, placed at hard labor for a month; if rogues and vagabonds, for not to exceed three months; if incorrigible rogues, they may be imprisoned for a year, and may be whipped. In the United States, vagrants or tramps were not frequent enough to call out special legislation till after the hard times of 1873. To-day the tramp problem has become a large one. The most careful study of tramps in the United States has been made by Professor J. J. McCook, of Hartford. In various magazine articles, as in *The Forum* and the *Charities Review*, it is estimated by Mr. McCook that there are about 46,000 tramps in the United States. This estimate is based on a statistical investigation of tramps living in Massachusetts, that State being the only one which attempts to collect the facts necessary for a calculation. Mr. McCook further estimates that 57 per cent. of our American tramps have trades or professions, 41 per cent. are unskilled laborers, 1 in 20 is under 20 years of age, 3 out of 5 are under 35, 75 out of 100 under 40, and 1 in 111 over 70. He believes that industrial causes have little to do with vagabondage, holding that intemperance is chiefly responsible for it. (But see POVERTY for a contrary view.) Sixty-three per cent. of the tramps with whom he has communicated are confessedly intemperate. Mr. McCook says further that 56 per cent. of our tramps are of American nativity; that more than nine tenths of them are married, and that a like proportion can read and write. Only 113 out of 1349 admitted that they had no religion.

Mr. McCook recommends uniform laws in all the States, committing drunkards and vagrants to places of detention, where they must abstain from drink, must work, and must keep clean, and that for an indefinite period. He thinks that they might be made to nearly or quite support themselves in such establishments, and in that event we would save \$10,000,000 or more a year.

Existing legislation in the United States follows, in the main, English lines. The old excessive punishments have been done away with,

partly because it is widely recognized that the tramp is the result of social and economic conditions, the removal of which on temperance and industrial lines is the only lasting remedy. Yet the laws to-day are frequently very unjust, blending the man out of work with the semi-criminal, and making poverty a crime. (See also UNEMPLOYMENT.)

TREVOR, JOHN, was born in Liverpool, Eng., in 1855, the son of a linen-draper. Sent to a Wisbech, he grew up under a narrow orthodoxy that rested like a crushing load on his imaginative spirit. In 1869 he was articled to an architect in Norwich, but gave more thought to theological and sociological problems. In 1877, broken in health, he went on a voyage to Australia, and thence to San Francisco, and then entered the Meadville (Pa.) Theological School, to prepare for the Unitarian ministry. Returning to London, he tried to preach, but thought he had no mission, and so returned to his profession of architecture in the south of England. He married and had four children born to him. Finding his profession commercialized and degraded by competition, he was compelled to study social problems more than ever, and he gradually worked out the views which he later embodied in his Labor Church, and at last felt that he had something to preach. He studied for a year at Manchester, New College, and then went to London to assist Mr. Wichsteed at Little Portland Street Chapel, but in 1890 went to Upper Brook Street Free Church, Manchester, and at last left all organized churches and started, October, 1891, the Labor Church Movement, for an account, by Mr. Trevor, of which, see LABOR CHURCH.

TRUSTS.—A trust in law may be defined as confidence reposed in any person by making him the nominal owner of property, which he may hold, use, or dispose of for the benefit of another. Such a trust is sometimes called an *active* or *special* trust, in distinction from a *naked* or *passive* trust, where the trustee is only a figurehead in holding a title, but with no discretionary powers as to its use or disposal. There may be also *express trusts* and *implied trusts*, according as the powers are expressed or implied. *Loan and trust companies* are simply a form of banks.

The popular use of the word trust, however, limits it to the particular case, eliciting so much attention to-day, where by a device of trusteeship, various corporations

Definitions. practically form one monopoly without losing their separate corporateness. The novel characteristic of such a trust is not in its being a monopoly, but in the way in which the monopoly is attained.

The fullest information on the subject of trusts is contained in a report of a committee of the New York State Legislature, which was appointed to investigate the new combination. The following trusts were inquired into: Sugar, milk, rubber, cotton-seed oil, envelope, elevator, oil-cloth, Standard oil, butchers', glass, and furniture. A trust is defined by the committee

as a combination "to destroy competition and to restrain trade through the stockholders therein combining with other corporations or stockholders to form a joint-stock company of corporations, in effect renouncing the powers of such several corporations, and placing all powers in the hands of trustees." The general purposes and effects are stated to be "to control the supply of commodities and necessities; to destroy competition; to regulate the quality; and to keep the cost to the consumer at prices far beyond their fair and equitable value."

Mr. Charles W. Baker, in his *Monopolies and the People*, says:

"A trust is a combination to restrain competition among producers, formed by placing the various producing properties (mills, factories, etc.) in the hands of a board of trustees, who are empowered to direct the operations of production and sale, as if the properties were all under a single ownership and management."

The first great trust formed was the Standard Oil Trust in 1882. (See STANDARD OIL MONOPOLY.) Since then innumerable trusts have been formed. Some have been nominally broken up, but more have been formed, and usually those which have been broken up have simply changed their form of combination to avoid or to fulfill some legal enactment. The general tendency to combination is at least as strong as ever. (See MONOPOLY; WEALTH.) Mr. H. D. Lloyd (*q.v.*), in the appendix to his *Wealth against Commonwealth*, gives a list of the articles in commerce affected by trusts or combinations of one kind or another, and the list occupies eight pages. The committee of Congress which investigated trusts in 1889 did not report any list of combinations to control markets, "for the reason that new ones are constantly forming, and that old ones are constantly expanding their relations so as to cover new branches of the business and invade new territories." Says Mr. Lloyd (*idem*, p. 4):

"Corners are 'acute' attacks of that which combinations exhibit as chronic. First a corner, then a pool, then a trust has often been the genesis. . . . The line of development is from local to national and from national to international. The amount of capital changes continually with the recrystallizations in progress. Not less than \$500,000,000 is in the coal combination (1894), which our evidence shows to have flourished 22 years; that in oil has nearly if not quite \$200,000,000, and the other combinations in which its members are leaders foot up hundreds of millions more. Hundreds of millions of dollars are united in the railroads and elevators of the Northwest against the wheat-growers. In cattle and meat there are not less than \$100,000,000; in whiskey, \$35,000,000, and in beer a great deal more than that; in sugar, \$75,000,000; in leather, over \$100,000,000; in gas, hundreds of millions. At this writing (1894) a union is being negotiated of all the piano-makers in the United States, to have a capital of \$50,000,000. Quite beyond ordinary competition is the magnitude of the syndicates, if there is more than one, which are going from city to city, consolidating all the gas works, electric-lighting companies, street railways in each, into single properties, and consolidating these into vast estates for central corporations of capitalists, controlling from metropolitan offices the transportation of the people of scores of cities. Such a syndicate negotiating in December, 1892, for the control of the street railways of Brooklyn, was said by the New York Times, "on absolute authority to have subscribed \$23,000,000 toward that end before a single move had been made or a price set on a single share of stock." It was in the same hands as those busy later

Extent.

in gathering together the coal mines of Nova Scotia and putting them under American control. There are in round numbers 10,000,000,000 of dollars claiming dividends and interest in the railroads of the United States. Every year they are more closely pooled."

Henry B. Brown, Associate Justice of the United States Supreme Court, said, in an address at the Yale Law School, June 24, 1895 :

"Corporations are a necessity in every civilized State. They have a practical monopoly of land transportation, of mining, manufacturing, banking, and insurance; and within their proper sphere they are a blessing to the community. On the other hand, the ease with which charters are procured has produced great abuses. Corporations are formed under the laws of one State for the sole purpose of doing business in another, and railways are built in California under charters granted by the States east of the Mississippi, for the purpose of removing their litigation to Federal courts.

"The greatest frauds are perpetrated in the construction of such roads by the directors themselves, under guise of a construction company, another corporation, to which is turned over all the bonds, mortgages, and other securities, regardless of the actual cost of the road. The road is equipped in the same way, by another corporation, formed of the directors, which buys the rolling stock and leases it to the road—so that when the inevitable foreclosure comes, the stockholders are found to have been defrauded for the benefit of the mortgagees, and the mortgagees defrauded for the benefit of the directors. Property thus acquired, in defiance of honesty and morality, does not stand in a favorable position to invoke the aid of the law for its protection.

"Worse than this, however, is the combination of corporations in so-called trusts, to limit production, stifle competition, and monopolize the necessities of life. The extent to which this has already been carried is alarming; the extent to which it may hereafter be carried is revolutionary. Indeed, the evils of aggregated wealth are nowhere seen in more odious form.

"If no student can light his lamp without paying tribute to one company; if no housekeeper can buy a pound of meat or of sugar without swelling the receipts of two or three all-pervading trusts, what is to prevent the entire productive industry of the country becoming ultimately absorbed by a hundred gigantic corporations?"

The Philadelphia *Times* a few years ago gave a list of trusts and other monopolies numbering 137, and estimated to represent a capital of \$1,507,060,000. According to a writer in the *Annals of the American Academy of Political and Social Science*, the Cordage Trust made \$1,406,313 in the year ending October 31, 1891—probably 40 or 50 per cent. on its capital. The Cotton Seed Oil Trust and Lard Trust have both cleared over \$2,000,000 in one year. (Concerning the political power of trusts, see PLUTOCRACY.)

Concerning the legal standing of trusts, Mr. George W. Kirchwey, writing in *Johnson's Cyclopaedia*, argues that they are not different from other monopolies, and can only be legally attacked in the same way. He says :

"There is nothing in the form, the organization, or the methods of the modern industrial trust to render it obnoxious to law. It is in all essential particulars a trust of the normal familiar type, such as are habitually enforced by the courts. In these external aspects it differs from ordinary trusts only in the magnitude of the interests involved. . . . Accordingly, in the litigation which has attended the development of these trust combinations their character as trusts has played little or no part, and those combinations that have been organized on the trust principle have been attacked and defended on precisely the same grounds as those which take on some other form. The field over which the battle of the trusts has been waged is covered by the two following points :

"Many acts which the individual may lawfully perform are forbidden to the corporation. The former

can retire from his business or turn his business over to some one else to be managed for him; the latter cannot retire without dissolution, nor has it any power to delegate to another corporation or person the duties which its charter requires it to perform. A corporation which abandons the business for which it was organized, and allows its property to be controlled and its operations to be carried on by a person or group of persons who have no direct relations, and who are not its agents, is acting *ultra vires* and in violation of its organic law, and thereby forfeits its right to exist at all. . . . These principles once settled the mode of attack is simple enough. Altho the trust is, as we have seen above, impregnable against direct attack, it can be effectually undermined and destroyed by breaking down the several corporations from which it draws its strength. . . . It was in this way that the Sugar Trust was broken up in New York and the great Standard Oil Trust in Ohio. . . . But . . . the 'trust' after it has been driven out of one form of organization can easily take refuge in another and different form. . . . There are several other forms of at least equal potency with which the principles above discussed have nothing to do. Thus they do not touch the case of individuals, nor corporations forming trust combinations of precisely the character and type of those under consideration. They do not reflect upon the right of corporations or of individuals to enter into far-reaching arrangements, regulating the rate and character of productions and the prices to be charged for goods and services. . . . Indeed this is precisely what has occurred in the case of the 'trusts' destroyed by the adverse decisions in New York, Ohio, and elsewhere. Of the large number of combinations in existence at the date of these decisions, it is not known that a single one has gone out of operation as a result thereof. They have disappeared as corporate trusts, but they have promptly reappeared and are in full operation as great corporations or as corporations held together by contract."

Legal Standing.

Mr. Kirchwey therefore discusses a second mode of attack, and says :

"Whether a given industrial combination be made up of individuals or of corporations, whether it be more or less closely held together by contract or be consolidated into a trust, if it constitutes or 'tends to create' a monopoly, or if it is found to be a conspiracy in restraint of trade it is obnoxious to law. This does not signify that it is liable to destruction at the instance of the State, nor that its promoters are subject to criminal prosecution, but only that the agreements and covenants on which it is based, being unlawful and contrary to public policy, will not be enforced by the courts and that it will be thus reduced to a mere voluntary association without binding force upon its members. When the monopoly is not based on agreement, but is executed by a single corporation or individual who has gained control of the market, the rate bill laid down has no application. As thus limited and defined, the rule against monopolies is one of the landmarks of the common law. But no rule of that law is more difficult of application. The crucial question whether a given combination is or is not a monopoly, as to whether a given agreement is or is not a conspiracy against the common weal, is well-nigh as broad as the rule itself, and the judicial attempts to answer it have thus far failed to develop any clear guiding principle. . . . The tendency in most of the States has been to declare against such combinations, but in the great case against the Sugar Trust the New York Court of Appeals refused to follow the lower courts in declaring the combination to be essentially monopolistic and hostile to the welfare of the State. It is believed that in the absence of legislation this more temperate and conservative view will ultimately prevail."

"In Restraint of Trade."

Such is Mr. Kirchwey's view. Equally hopeless to the enemy of trusts appears legislative action. No fewer than 13 States, mainly in the West, passed anti-trust laws in 1889, and five more States in 1890. Georgia passed a law of this nature as early as 1877, probably the first law of the kind. New York passed one of narrower scope and doubtful validity in 1893. All

of these statutes are penal in character and appear to be sufficiently explicit and drastic. They declare all combinations or agreements regulating the supply or price of any article or commodity to be criminal conspiracies, and declare such contracts or combinations to be null and void. Yet there have been no decisions under these statutes which have conclusively demonstrated their efficacy. There is considerable difference of legal opinion as to their constitutionality on account of their interference with vested property rights, and Mr. Kirchwey (as above) thinks combinations could easily adopt a form of organization which would avoid their operation.

July 2, 1890, Congress passed an Anti-Trust Act, and the Tariff Act of 1894 contains a similar provision, but it is so indefinite and inconclusive that both are generally regarded by lawyers as useless. This applies only to interstate commerce.

The Attorney-General of the United States, whose duty it is to direct prosecutions to enforce national laws, argues in his report for 1893 why it is impossible to enforce the anti-trust law. He shows "what small basis there is for the popular impression," "that the aim and effect of this statute are to prohibit and prevent these aggregations of capital which are so common at the present day, and which sometimes are on so large a scale as to practically control all the branches of an extensive industry." He says "it would not be useful, even if it were possible, to ascertain the precise purposes of the framers of the statute." He says that "since all ownership of property is a monopoly, . . . any literal application of the provisions of the statute is out of the question."

Concerning the economic bearing of trusts, with arguments in favor of monopolies as well as opposed to them, and also a statement of the various ways proposed for meeting the problems they raise, see MONOPOLY. It should be stated here that some reformers do not believe in attempts at restricting them, believing them a natural stepping-stone, as some think, to socialism (*q. v.*), as others think to extreme individualism (*q. v.*). See also MONOPOLY and PLUTOCRACY.

TUCKER, BENJAMIN R., was born near New Bedford, Mass., in 1854. His early education he received in private schools and at the Massachusetts Institute of Technology. Engineering did not appeal to him, and he decided to enter the profession of journalism. He served his apprenticeship in a printing office, and in 1878 joined the editorial staff of a Boston newspaper. He became acquainted with the leaders of the New England Labor Reform League, and was introduced to radical thought by Josiah Warren, Colonel William B. Greene, and others. He made a thorough study of Proudhon, and decided that "anarchism," the term used by the French philosopher, was the most appropriate designation for the political and economic doctrines taught by the New England individualists. In 1877 he established a

quarterly called *The Radical Review*. At the end of a short period Mr. Tucker concluded that the propaganda of his views could be carried on most effectively and directly by a fortnightly or weekly organ. Accordingly he established *Liberty*, which is still published, and which is recognized in philosophical and progressive circles of America and Europe as the ablest and most authoritative champion of individualistic anarchism. Being too busy to write books, Mr. Tucker published in 1893 a volume called *Instead of a Book*, consisting of selections from his writings in *Liberty* and lectures delivered to different reform clubs and associations. Although fragmentary, the exposition of the anarchistic philosophy found in this work is the clearest and most complete extant. Socialism, communism, the single tax and other reforms are subjected to searching criticism from the anarchistic point of view. Mr. Tucker is also the translator of several works of Proudhon, Bakounin, and Tchernishevsky. He claims no originality for his views, and regards Proudhon, Greene, and Warren as his masters and teachers. He does not, however, strictly follow either of these thinkers, especially on the subject of ethics, and the political system advocated by him is in many respects materially different from those of his acknowledged guides.

VICTOR YARROS.

TURGENEFF, IVAN SERGYEVITCH, born 1818, in Orel, is probably the ablest Russian novelist up to the present time. He was the son of an officer of cuirassiers, and was educated at Moscow and afterward at the University of Berlin. In 1852 he first became the object of government displeasure. He was imprisoned for a month for an article he wrote on the death of Gogol, and was compelled to reside for two years more in the country. This experience seems to have been in some sense a turning-point in his career, for in 1855 he commenced publishing the novels which have had such a vital connection with the social life of Russia. In 1855 he published *Dimitri Rudin*; in 1858, *A Nest of Nobles* and *Helene*; in 1862, *Fathers and Sons*, which work was one of the most potent means in wakening into action the philosophy of negation and materialism. It was this book, too, which gave to the philosophy the name of "nihilism," which it has borne ever since. In 1865 he published *Smoke*, and in 1877 *Spring Floods* and *Virgin Soil*. Besides his more important novels he wrote many shorter stories; and his last work was a collection of prose poems entitled *Senilia*, which for power and pathos takes rank with his best work. After the publication of *Fathers and Sons* he left Russia and settled in Baden, where he stayed until the termination of the Franco-German War, when he removed to Paris, where he resided until his death in 1883.

TURGOT, ANNE ROBERT JACQUES, BARON DE L'AULNE, was born in Paris in 1727. Educated for the Church, he gave up an ecclesiastical career and studied law, becoming noted as a liberal thinker and contributor to the *Encyclopédie*. He associated with Quesnay and Gournay, and accepted to some extent their

views. (See PHYSIOCRATS.) In 1761 he was appointed intendant-governor of the province of Limousin, and in 1774 Comptroller-General of France under Louis XVI. The courtiers and nobility bitterly opposed his reform ideas, but for a while the king supported him, and he was able to introduce free trade in grain and other reforms. At last the king, in 1776, was induced to depose him, and Turgot retired to private life and devoted himself to science till his death in 1781. His *Œuvres Complètes*, including his essays on usury, on taxation, and *Réflexions sur la Formation et la Distribution des Richesses*, etc., were published in nine volumes (1808-11).

TWEED RING.—The Tweed Ring of New York City may be said to have begun in 1863, when William Marcy Tweed, a chairmaker of Scotch descent, born in New York in 1823, was appointed deputy street commissioner. He had been long prominent in local politics, and in 1853 had been elected to Congress. He was a member of Tammany (*q.v.*) for many years, and from 1860-71 its grand sachem. Becoming the virtual head of the Street Department, and later of the Department of Public Works, he enormously extended the expenditures for "improvements," and created numberless offices, giving him vast influences and the bestowal of

sinecures on his friends. A ring gradually developed, and by 1869 held almost every department of the city in its power. In 1868 the ring's greatest scheme of robbery was begun—the building of a new county court house. It was stipulated not to cost over \$250,000. Before 1871 it had cost \$8,000,000, and was still unfinished. In 1870 the power of auditing accounts was taken from the supervisors and vested in certain city offices filled by friends of the ring. All restraints on fraudulent bills were then removed. Bills amounting to \$6,000,000 were passed at the first and only meeting of the Board of Audit. Of this amount \$1,000,000 was traced to Tweed's own pocket. A secret account of the money thus paid was kept in the auditor's office, entered "County Liabilities." During the winter of 1870-71 a clerk stealthily copied its items and showed them to his patron, James O'Brien, an opponent of Tammany. He gave them to the *New York Times*, and they were published in July, 1871. The excitement created an investigation, and through the efforts of Samuel J. Tilden the frauds were exposed and the ring overthrown in the election of November, 1871. Tweed was tried for grand larceny and forgery, and November 22, 1872, sentenced to 12 years' imprisonment and a heavy fine. In 1875 he escaped and fled to Spain, where he was captured and returned to New York City in 1876, dying in Ludlow Street Jail in 1878.

U.

UNEMPLOYMENT.—We consider this question under three heads: I. The Number of the Unemployed; II. The Causes of the Unemployment; III. The Meeting of the Problem (*a*) in temporary crises; (*b*) in more permanent ways.

I. THE NUMBER OF THE UNEMPLOYED.

This is most variously estimated by different authorities mainly because they use the word in different senses. Mr. Carroll D. Wright, in his report as Commissioner of Labor in 1886, says he means by the unemployed "those who under prosperous times would be fully employed, and who, during the time mentioned, were seeking employment." Using the word in this special sense, he is naturally able to reduce the number of the unemployed to the lowest limits, and consequently to make those who, using the word in its natural sense, estimate the number as very much larger, appear guilty of gross exaggeration, for obviously to get those who are *without remunerative work* in times of depression one must add to Mr. Wright's number, the very large number who under prosperous times are not "fully employed." Mr. C. D. Kellogg, of the New York Charity Organization Society, and Professor R. T. Ely, of Wisconsin University, have both separately estimated those receiving pauper aid in the United States as no less than 3,000,000. Adding to these those who do not receive aid, but who perhaps through long periods are out

of work or only work a few days a week on half time or one third time or even less, one gets a very different idea of the number of the unemployed, meaning by it those who do not have remunerative work. Even this, however, by no means gives the whole truth, since in the middle classes there are an increasing number of persons who do not work in factories or stores, where statistics of employment are usually sought, but who are often in secret bitterly suffering for lack of remunerative work, caused perhaps by combinations of business offices and discharge of clerks. They have to keep up appearances just as long as possible in order to keep credit and to secure work. Often the bitterest suffering is in this class, of which the general public rarely hears and which statistics rarely reach. It is, then, remembering these things, and asking always what one means by the unemployed, that one must consult the so-called "statistics" of the subject. Yet, rightly understood, these may be of value. Perhaps the most careful statistical study of the subject is that of the Massachusetts Bureau of Labor for 1885, and published in its report for 1887. It says (concerning Massachusetts):

"The whole number of persons, of both sexes, who were unemployed at their principal occupation during some part of the year represented by the 12 months which preceded the census enumeration of population, May 1, 1885, was 241,580. Of this number, 178,628 were males and 62,961 were females. . . .

"Of a total of 816,470 persons employed in gainful occupations, the unemployed persons, 241,586 in num-

ber, represent 29.59 per cent., while 574,881 persons, or 70.41 per cent., were employed during the entire year. . . . The unemployed persons were unemployed at their principal occupation, on an average, 4.11 months, while for all persons employed in gainful occupations, considered as a whole, whether employed or unemployed, the average unemployment during the census year was 1.22 months. In other words, a little less than one third of the persons returned as being engaged in remunerative labor were unemployed for about one third of their working time; while, on the other hand, the working population of the State, considered in their entirety, were employed at their principal occupation for a trifle less than 11 months during the census year.

"The results just shown for 241,589 persons unemployed, on an average, 4.11 months during the year may be considered as being equivalent to 82,744 persons unemployed for an entire year."

The report also gives the following table classifying the unemployed by occupations :

SEX AND OCCUPATIONS.	TOTAL UNEMPLOYED PERSONS.	UNEMPLOYED PERSONS HAVING "OTHER OCCUPATIONS."
	Percentages.	Percentages.
<i>Males.</i>	100.00	100.00
Government and professional.	1.22	2.44

Of the United States as a whole the *United States Labor Report* for 1886 says (p. 65) :

"It is undoubtedly true that out of the total number of establishments, such as factories, mines, etc., existing in the country, about 5 per cent. were absolutely idle during the year ending July 1, 1885, and that perhaps 5 per cent. more were idle a part of the time; or, for a just estimate, 7½ per cent. of the whole number of such establishments were idle or equivalent to idle during the year named. According to the census of 1880, there were, in round numbers, 255,000 such establishments, employing upward of

2,250,000 hands. If the percentage stated above is correct, and it is believed to be approximately so, then there were possibly 19,125 establishments idle or equivalent to idle, and 168,750 hands out of employment, so far as such establishments were concerned, during the year considered. The percentage stated, if erroneous at all, is probably too large, because the idle establishments were to a large extent small and poorly equipped. In some industries the percentage of idle establishments would be much greater than the average given, while in other industries the percentage given is much too large. Applying this percentage, however, to the whole number of people employed in all occupations in the United States, which in 1880 was 17,392,099, there might have been 1,304,407 out of employment; but this is a number evidently too large, because it applies to all occupations—those engaged in agriculture, professional and personal service, trade and transportation, mechanical and mining industries, and manufactures. The percentage should be applied only to those engaged in agriculture, trade and transportation, mechanical and mining industries, and manufactures. There were engaged in these four great branches, as shown by the census of 1880, 13,317,861 persons. Applying the percentage arrived at (7½ per cent.), we obtain a total of 998,839 as constituting the best estimate of the possibly unemployed in the United States during the year ending July 1, 1885 (meaning by the unemployed those who, under prosperous times, would be fully employed, and who during the time mentioned were seeking employment), that it has been possible for the bureau to make. It is probably true that this total (in round numbers 1,000,000), as representing the unemployed at any one time in the United States, is fairly representative, even if the laborers thrown out of employment through the cessation of railroad building be included.

"This estimate exhibits the extreme possibility of non-employment at the worst point of the depression, but it should be remembered that even in so-called prosperous times there are from two to two and one-half per cent. of the forces considered out of employment. Prosperity often shifts employment from one class to another."

Mr. Wright has since explained that this was written only of 1885, a year which he considers one of industrial depression, and therefore is *not to be taken as a general statement*, and that these 1,000,000 unemployed are the unemployed at *any one time*, so that the inference is not to be drawn that there are so many unemployed all the time. But, on the other hand, it must be remembered that by the unemployed Mr. Wright means only those who in times of prosperity have full work and are thrown out of work only by depression. On this point a Massachusetts State Commission on the Unemployed says in its report (1895) :

"It is clear from the investigation which we have been able to make that non-employment will fluctuate in amount from month to month and year to year, and is and has been a factor, and, in certain phases, is an increasing evil. We have been unable to persuade ourselves that this problem is on the whole associated with the depressed industrial condition of the past two years. This problem must be looked upon as a more or less permanent one, and one that must be attacked, if attacked at all, by slow and patient methods. Evidence is too clear that even in so-called normal times there is an amount of non-employment which occasions suffering."

An argument seeking to show that the number of the unemployed is exaggerated is sometimes drawn from census statistics showing increase in the number of those having occupations; but the question is not as to those having nominal occupations, but as to how far they get work in their occupations. Nor are even the statistics of occupations as roseate as at first appears. Says Mr. Carroll D. Wright (*Industrial Evolution in the United States*, p. 378) :

"In the 20 years, 1870 to 1890, the population increased 62.41 per cent., while the number of persons

in all occupations increased 81.80 per cent. An analysis of these statements shows that the increase of the number of those engaged in manufacturing, mechanical, and mining industries, those in which the influence of inventions is most keenly felt for the period from 1860 to 1890, was 172.27 per cent. as against 99.16 per cent. increase in the total population. If statistics could be as forcibly applied to show the new occupations brought into existence by invention, it is believed that the result would be still more emphatic."

If, however, the decade 1880-90 had been taken, other results would have appeared. During that decade population increased 24.86 per cent., and those in gainful occupations 30.72 per cent., but this increase was very largely in occupations open to women. Men in occupations increased only 27.64 per cent., or less than 3 per cent. more than the population—an increase very possibly due to better registration, for in 1890 men worked in materially larger establishments than in 1880, and so were easier to register; and it must be remembered that even were there more men with "occupations," that shows nothing about employment. Suppose there were 103 shoemakers instead of 100, the question still remains how much work the shoemakers had. In every country investigations, commissions, relief agencies show that the problem is steadily increasing in seriousness and in proportions. In the United States the problem is unquestionably of the most serious moment.

Of the unemployed in England, John Burns writes in the *Nineteenth Century* for December, 1892 :

"Disguise it how we will, hide it tho we may, looming up is the great, the all-absorbing question for all countries and governments to face—how can the honest worker be provided with work uncontaminated with pauperism's degrading taint and charity's demoralizing aid? The glib quotation of figures showing that official pauperism has decreased only insults the genuine worker who asks for work, so that it may be reduced further still. But even the official statistics, when shorn of all their complacent optimism, reveal the real nature of the problem. The fact that a cruel administration of the poor law, which mixes honest and criminal together, has reduced official pauperism from 46 to 20 per thousand, is cold comfort to the men who, by physical necessity or want of work, are compelled to be of the 20. The growth of trade-unionism, friendly, sick, loan, cooperative, and other agencies that the workers resort to in times of distress, is not recognized as a factor in reducing the distress which, in the absence of such agencies, the Poor Law would have to meet. Exploiting the ever-increasing repugnance among the genuine poor to pauper relief, the officials representing the *laissez faire* middle class are determined to throw the support of the worthless, that the rich and poor now sustain, on the poor exclusively, who voluntarily, taxed as they are, cannot carry further burdens.

"Outside the official pauper class, as Mr. Charles Booth proves, there are hundreds of thousands of people whose standard of life and comfort, from the point of view of food, clothing, and house accommodation, is lower than that of the pauper or criminal, yet these people will not accept relief, but struggle on in the vain hope of work that never comes, and which, if it did, would find them too low to perform it. The fact is the virtue—or vice—of thrift and independence among the pick of the working classes, which well-fed reformers contend is applicable to all, is being abused and exploited. When the poor refuse poor law relief, it is construed as proof that its abolition is justifiable. When, as a better alternative, the poor man asks for work, he is told that that is pauperism in another form. When he becomes ill through neither relief nor work being offered or accepted, or, as a last resource, thieves and goes to prison, he has to be kept, after his health and morals have been shattered, till he dies. . . . Having experienced the lot of the workless worker, I believe, with Carlyle, that 'a man willing to work and unable to find work is, perhaps, the saddest

sight that fortune's inequality exhibits under the sun.'"

Fabian Tract No. 5 (March, 1895) gives what statistics there are for England and Wales. It says :

"Of the great permanent army of the 'unemployed' no reliable statistics can be obtained. From returns rendered to the Labor Department of the Board of Trade by trade-unions, it appeared that in December, 1893, the percentage of members unemployed was 7.9 (*Annual Report of Labor Department, Board of Trade, 1893-94, C-7505*). The average number of persons in London whose home is the 'common lodging-house' is over 30,000; over 1100 are every night found in the 'casual wards.'"

"As regards the 4,000,000 of persons in the metropolis, Mr. Charles Booth tells us that 37,610, or 0.9 per cent., are in the lowest class (occasional laborers, loafers, and semi-criminals); 316,834, or 7.5 per cent., in the next (casual labor, hand-to-mouth existence, *chronic want*); 928,203, or 22.3 per cent., form 'the poor' (including alike those whose earnings are small, because of irregularity of employment, and those whose work, tho regular, is ill-paid). These classes, on or below the 'poverty line' of earnings not exceeding a guinea a week per family, number together 1,292,737 or 30.7 per cent. of the whole population. To these must be added 99,830 inmates of workhouses, hospitals, prisons, industrial schools, etc., making altogether nearly 1,400,000 persons in this one city alone whose condition even the most optimistic social student can hardly deem satisfactory (*Labor and Life of the People*, edited by Charles Booth, 1891, vol. ii., pp. 20, 21).

"In England and Wales in 1892, 66,424 deaths were registered as having taken place in workhouses, infirmaries, hospitals, and asylums, or 11.9 per cent. of the total deaths. Of these, 39,748 occurred in workhouses, 20,440 in hospitals, and 6236 in lunatic asylums.

"We long our public poor relief with irksome and degrading conditions, so that the honest poor often die lingering deaths rather than accept it; yet the paupers in actual receipt of public relief on one day number more than 1,000,000 :

England and Wales, January 1,		
1893.....	776,458	cost £8,847,678
Scotland, January 14, 1893.....	193,496	" 912,838
Ireland, January 8, 1893.....	102,865	" 1,054,574
	1,072,819	£10,815,030

(*Report of Local Government Board, England and Wales; Report of Board for Supervision of Poor, Scotland; Report of Local Government Board, Ireland, and Statistical Abstract, 1893, C-7, 143*.)

"But the relief is not usually given permanently; to obtain the number of different individuals who receive relief during a year, we must multiply the daily number by 2.3. (This is the latest computation given in Mr. Charles Booth's paper before the Statistical Society, December, 1891. See also his *Pauperism, a Picture; and the Endowment of Old Age, an Argument*.) This gives a pauper class during any one year of about 2,460,000 persons, or 1 in 11 of the manual labor class. In some rural districts every aged laborer is a pauper."

Thus far we have been considering mainly those either totally unemployed or only having casual work. But even those who have regular employment are often out of work months at a time. As we saw above, in Massachusetts in 1885 the average loss from this source for all the employees in the State was five weeks in the year. The Illinois Labor Report for 1886 publishes returns from representative working men, estimating that for 85,329 working men the average time at work was only 37.1 weeks, or only 71.3 per cent. of full time. In England, Baxter estimates (quoted in *The Present Distribution of Wealth in the United States*, by Dr. C. B. Spahr, p. 102) that the great body of working people are only employed from 41 to 44 full weeks per year, the more skilled factory hands reaching the higher figure. (For the bearing of this unemployment on wages, see WAGES.)

II. CAUSES OF UNEMPLOYMENT.

The first cause of unemployment usually popularly given, and sometimes even given by students of the question, is personal inefficiency (in one form or another, but especially in the form of intemperance). The statement is continually made that if everybody stopped drinking, or that if shiftlessness and thriftlessness were removed, everybody would find work who was willing to do any kind of work. In support of this view is the very well-known fact that large numbers, and even perhaps the large majority, of those unemployed are in some way inefficient, many of them shiftless, very many of them with habits of drink, not a few of them unwilling to work when they can get it, or at least not willing to work unless at certain so-called "respectable trades." Innumerable instances can be told and continually are told of benevolent people who have given or offered or obtained work for the unemployed, and it has either not been accepted, or has not been adhered to, or has been done so poorly as not to merit continuous employment. Instances occur everywhere where money is given to the destitute and it is wasted in some utterly foolish and perhaps wicked way. Still more common are illustrations of how intemperance ruins the best workmen and leads to large proportions of the cases of poverty and unemployment. The three main causes of unemployment thus certainly seem to be intemperance, shiftlessness, and lack of thrift. But against this view there is also much to be said. In the first place, inefficiency may appear to be more often the cause of unemployment than it is because it is generally the inefficient who are *most in evidence*. It is generally the weakest, the least efficient, and those who least respect themselves who beg at the rich man's door or throng the bureaus of relief. Benevolent people thus usually see the worst and the weakest among the unemployed. The worthy and able will do all but starve, and sometimes literally starve, before they seek alms. Charity experience, therefore, often misleads. Secondly, inefficiency may be the cause, not why people are idle, but why certain persons are unemployed and not others. If depression compels an employer to discharge 10 men out of 100 he naturally, and under present conditions probably rightly, discharges that 10 which are on the whole of least efficiency. They may be neither very bad nor very inefficient. In good times the employer would keep them. Obviously the cause of their unemployment is the hard times, and inefficiency is only the cause why they are discharged and not others. Thirdly, benevolent people who see that unemployment and inefficiency usually go together, forget that a concomitant is not always a cause. Unemployment may be the cause of the inefficiency and not inefficiency the cause of the unemployment. Including inherited unemployment, this is doubtless very often the case. Particularly is this true of intemperance and shiftlessness. Under article POVERTY will be found a summary of practically all the scientific expert investigation of the facts as collated by Professor Warner in his book *American Charities*, and it there appears that 74.4

per cent. of poverty is directly traceable to causes for which the individual is not to blame, and only 21.3 per cent. to causes for which the individual is to blame. Only 11 per cent. of poverty is there attributed first to drink; 28.5 per cent. is accredited to lack of or to poorly paid work. A still more recent table, published by the American Statistical Association, based on records of charity organization societies, gives the following percentages of causes of poverty: Lack of employment, New York, 48 per cent.; Baltimore, 43; six smaller cities, 35; sickness, New York, 18; Baltimore, 18; smaller cities, 35; intemperance and shiftlessness, New York, 18; Baltimore, 13; smaller cities, 20; miscellaneous, New York, 14; Baltimore, 21; smaller cities, 27. (For a contrary view, see *INTEMPERANCE*.)

The reason why drink appears to so many people, even of those engaged in charity work, to be the main cause of poverty, is that in most cases, before the case of destitution has grown serious enough to claim the attention of charity, some member of the family, discouraged and weak, has taken to drink. But the question is what sent him to drink? It may be bad heredity, bad tenement homes, and faulty education and training. Inefficiency may lead to unemployment, but what leads to inefficiency? Not always vice. Some persons fail in business because they will not stoop to the tricks of their trade, or at least cannot throw themselves into doubtful transactions with the necessary zest.

Says John Stuart Mill (*Fortnightly Review*, February, 1879):

"If persons are helped on their worldly career by their virtues, so are they and perhaps quite as often by their vices, by servility and sycophancy, by hard-hearted and close-fisted selfishness, by the permitted lies and tricks of trade, by gambling speculations, not seldom by downright knavery. Energies and talents are of much more avail for success in life than virtues; but if one man succeeds by employing energy and talent in something generally useful, another thrives by exercising the same qualities in outgenerating and ruining a rival." (See *COMPETITION*.)

Says Ruskin (*Unto this Last*, Essay IV.):

"In a community regulated only by laws of demand and supply, and protected from open violence, the persons who become rich are, generally speaking, industrious, resolute, proud, covetous, prompt, methodical, sensible, unimaginative, insensitive, and ignorant. The persons who remain poor are the entirely foolish, the entirely wise, the idle, the reckless, the humble, the thoughtful, the dull, the imaginative, the sensitive, the well-informed, the improvident, the irregularly and impulsively wicked, the clumsy knave, the open thief, and the entirely merciful, just, and godly person."

It may then be said that undoubtedly the first cause of unemployment is inefficiency, but that inefficiency is not always synonymous with vice, and that when it is the real question is, What caused the inefficiency? (For that question, see articles *POVERTY*; *INTEMPERANCE*; *TENEMENTS*; *COMPETITION*; *WAGES*.) We come then to ask what are the social causes of unemployment? Here, however, so many answers are made that they cannot be considered in this article. Most authorities believe that the existence of the unemployed is due to changes and improvements in the methods of production, at least temporarily substituting machine work for human work. (For a discussion as to whether this is a permanent or only temporary result, see *MACHINERY*.) Socialists argue that

unemployment is due not to machinery, but to the monopoly of machinery and the underpay of the producer, so that he has no money to buy that which he produces. Mr. Hobson considers unemployment due to underconsumption and the greed of men to make more money rather than to spend. Many believe it is due to financial ills and a wrong monetary policy. The problem is, however, in a sense the problem of this whole cyclopedia; and various bodies of thinkers hold such various views that they can be considered only under the separate articles treating of those views. (See OVERPRODUCTION; COMPETITION; TRADE-UNIONS; SOCIALISM; INDIVIDUALISM; SINGLE TAX; BIMETALLISM; SILVER; MONOMETALLISM, etc.) Here only it must be remembered that the problem of the unemployed is not a problem by itself, but one wrapped up in the whole modern industrial situation.

III. METHODS OF RELIEF.

(a) IN TEMPORARY CRISES.

We give under this head a brief account of the various measures which have been tried or proposed in various cities to relieve the unemployed in times of temporary crises, and notice, first, the measures undertaken in America in the winter of 1893-94. The most noteworthy of these efforts was undoubtedly the Detroit plan of the so-called potato farms, or the giving of the use of land to the unemployed and allowing them to raise vegetables upon them and secure the profit. This, however, we consider under an article by itself. (See DETROIT PLAN.) In Baltimore, the various charities conducted relief along ordinary lines, with the giving of soup, etc., and a central committee was appointed which arranged for a stone yard where men could be employed. In Boston, a large relief committee appointed by the mayor collected funds and employed men upon city work, constructing sewers, opening and cleaning streets, etc.; women were employed in extemporized sewing rooms. Men were paid from \$1 to \$1.50 per day for city work; women at the larger rooms were paid 80 cents per day. The women were employed mainly in making rag carpets and crazy quilts for the Sea Island sufferers, in order not to compete with any regular industry. Some men unable to do outside work were employed in the same way; 5761 men and 3479 women were given more or less work. In Cincinnati, the city appropriated \$30,000 to employ men in the parks, and a committee of citizens employed men in the wood yard of the associated charities. In Chicago, relief was organized on a very large scale, with soup kitchens, etc., and something was done in the way of giving work. Men worked for their meals to some extent on street cleaning. Nine sewing rooms employed 1478 women at 50 cents per day. In Denver, the city supplied tents and food for a temporary "labor camp," and employed as many as it could on city works. A wood yard was opened by private charity. In Indianapolis, a committee of the Commercial Club organized a food market. Those deemed needy were employed on private work, or that failing, on city works,

and were paid in checks on the food market entitling them to a week's rations, consisting of moderate amounts of potatoes, corn meal, hominy, pork, molasses, bread and soap, and during the latter part of the time flour and coffee. Skilled workmen were paid at special rates of the work. Of the relief works at Lynn, Mass., the *Review of Reviews* for January, 1894, gives the following account, which is typical:

"It was resolved to deal with the situation through the existing organizations, simply adding to the Associated Charities a department of labor, the work to be done on the city streets and parks, and to be paid for by a citizens' subscription. In order to avoid the well-known and serious perils of all attempts at special emergency relief—such as calling in throngs of the workless from other cities, disturbing the regular lines of labor, encouraging imposition and stimulating a profuse and chaotic private relief—it was resolved to proceed under the following rules: (1) No public call for money, and no advertising of the bureau through the papers; subscriptions to be secured by personal solicitation, and the work advertised only through the churches and relief societies, and by the spectacle of the men at work. (2) No work given except to actual citizens of Lynn, in extreme need, and having no other friends, helpers, or resources; these facts ascertained by thorough domiciliary investigation in every case. No rumors to be heeded, no guesswork to be relied upon, nothing to be done in the dark; actual knowledge to be the only basis of help. The results of investigation to be placed at the service of relief-giving societies and individuals. 3. A half day's work for \$1, and work arranged so as to enable each man to earn an average of \$3 a week, this wage supplemented in cases of extreme need."

In New York City, a private East Side Relief Works Committee employed men in cleaning streets in connection with the city department, in tenement sanitation, and in tailor shops; 3292 different men were employed in street cleaning; over one third of them, however, were employed only one week, two were employed 22 weeks; 491 at one time were employed in tenement sanitation; 700 houses had their halls, cellars, or some of their rooms white-washed or kalsomined; 47,000 rooms or halls were scrubbed; refuse was removed. Four tailor shops were opened on the same plan as in Boston, the only 250 men and women were employed. Work was given at home to 433 more. In street cleaning \$1 a day was paid for seven hours' work. In the tailor shops 60 and 70 cents and a lunch was paid, and later \$4 a week for five days' work.

In Philadelphia, relief was given on a somewhat large scale, but very little work. One ward charity organization gave work in alley cleaning, the pay being \$1 a day. In Pittsburgh, a central committee raised \$256,000, of which Mr. Carnegie gave nearly half, and employed 13,529 men on parks and streets, etc., at \$1 per day. Thousands of those applying were said to be artisans, clerks, and even professional men. In St. Paul, men were employed on city work at \$1 per day, with a fund raised by a private committee.

This account is mainly of the efforts made to give work. For the relief on other lines, see CHARITY ORGANIZATIONS; but trade-unions and other societies also gave much relief, mainly to their own unemployed members. In some cities, like Chicago and Boston, the unions raised considerable sums for distribution. In Massachusetts, 13 Citizens' Relief Committees raised \$147,000, about two thirds of this in Boston.

Great Britain has had considerable experience in emergency relief of the unemployed. In 1860-61 there was an unusually severe winter, and a fund of about £40,000 was raised in London and distributed mainly through the police courts. In 1863-64, mainly on account of the cotton famine (*q. v.*), there was great distress from lack of work in Lancashire. A special measure was enacted placing £1,200,000 at the disposal of the authorities to organize relief work. Sewers and similar works were undertaken, and it was stated that the factory hands readily learned unusual work; 33,014 were given work. In 1886 a fund, known as the Mansion House Fund, was raised in London, but it is generally thought that it was not wisely spent.

In 1892-93, 33 parishes in London undertook special relief work, mainly in street cleaning and repairing, sewerage, etc. It was very differently conducted in different parishes, occasionally wisely, usually with poor results. The amount of work given varied from two to six days per week. Wages varied from 4½d. to 9d. per hour, and from 2s. 8d. to 4s. per day. Outside of London work was given in 63 districts. The Mansion House Committee raised £1315, of which £564 were paid in wages, £416 for emigration, £107 for relief, £83 for tools, etc.; 253 men were employed at 6d. per hour. The men must be waterside laborers. The work was given mainly as a test, but good work was required and obtained. In 1893-94 work was given by 27 district authorities, seven in London.

In Germany, in 1893-94, most of the cities gave some work, employing men usually in stonemasonry or street work.

(b) MORE PERMANENT METHODS.

The Massachusetts Commission on the Unemployed mentions 12 plans as having been advocated by different persons to meet the problem of the unemployed:

- "1. Removal of residents of cities to the country and farms.
- "2. Removing the competition and hence displacement of free labor occasioned by the labor of inmates of reformatory and penal institutions.
- "3. Reducing the hours of a day's labor.
- "4. Restriction of immigration.
- "5. An extension of industrial education.
- "6. Improving the intelligence and employment offices, or establishing free employment offices.
- "7. That the State or municipality should establish factories or engage in industrial enterprises, with a view of giving employment.
- "8. That the State should establish State farms.
- "9. That the State should increase its ordinary public works, and distribute a part of such undertakings to the winter season.
- "10. That the public works, either of the State or municipality, should be done directly by the public authorities, and that no work should be done by contract.
- "11. That all public works should be done by residents.
- "12. That the State should create labor colonies.

Most of these plans are plans proposed by their advocates for meeting not only the problem of the unemployed, but other social problems as well, and are therefore treated in articles by themselves. This includes Plans 2, 3, 4, 5, and 10. (For a discussion of them, see articles CONVICT LABOR; SHORT-HOUR MOVEMENT;

IMMIGRATION; INDUSTRIAL EDUCATION; CONTRACT LABOR.) Plan 1, advocating the removal of the residents of cities to the country and farms, can be best studied under articles ABANDONED FARMS; AGRICULTURE; FARMERS' MOVEMENT; EMIGRATION. With the present lack of means and education among the city unemployed it is almost hopeless to try and induce them to go to the farms, and with the present condition of the farming interests there is little to encourage this movement except with State aid, which leads us to Plan 8 of State Farms. Of this plan there has been some experience. New Zealand has done most on this line (for a brief account of which, see NEW ZEALAND), but the colony of Victoria also passed an act August 31, 1893, "to provide for the establishment of village communities, homestead associations, and labor colonies." A Victoria report of July 30, 1894, says:

"The popularity of the Act was demonstrated immediately upon its becoming law by the large numbers of persons who daily thronged the office, eager to take advantage of its provisions; and that popularity has been well maintained, as will be seen from the fact that during the past two months no fewer than 453 applications have been received and registered. The total number of applicants since the Act came into operation is 4080, of which 2122 have been approved, 993 refused and withdrawn, leaving a balance of 965 in course of being dealt with, not including applicants under Part III. . . .

"The Act is divided into three parts—viz.: Part I., Village Communities. Part II., Homestead Associations. Part III., Labor Colonies.

"Under Part I., any person not under the age of 18 years who is not the owner in fee simple of 2 acres or upward, nor the lessee of a pastoral allotment or grazing area, nor the holder of a license under section 42 or section 49 of the Land Act, 1890, nor a lessee under Part II. of this Act, is entitled to obtain an area from 1 to 20 acres. Under this Part of the Act 2726 persons have made application.

State Aided Farms.

"Part II. provides for associations or combinations of persons of not less than six, requiring acres of from 1 to 50 for each settler. Any person over the age of 18 years, not being a married woman, not holding 10 acres of land or upward in fee simple, and with the other restrictions named in regard to Part I. of the Act, can become settlers under this Part. Under Part II. of the Act, 2 societies, representing 71 members, and 152 associations, representing 1283 members, have made application; the total number of applicants under this Part being 1354.

"The reports upon settlements under this Part of the Act are, notwithstanding the many initiatory difficulties, fairly encouraging. . . .

"The number of settlers that have availed themselves of monetary assistance under section 32 of the Act is 985, and the total amount advanced is £8873, being less than half the amount voted by Parliament, and 42½ per cent. of the value of improvements effected, and in no case has it exceeded the value, after inspection, of such improvements. This aid has generally been given in monthly installments, at the rate of 10s. per week. . . .

"The Special Report on the Richardson Settlement at Lyonville, hereto attached, will be read with interest. This settlement was first started to give work to the unemployed—cutting firewood and mining timber. Immediately the Land Settlements Act came into operation, the land on which they were working was made available, and the people so employed placed upon their own allotments. It will be seen that the total expenditure during the year amounted to £2650 3s. 10d., and that the receipts from the sale of the timber and the value of stock on hand is £2832 10s. 7d. There are 341 souls on the area set apart, and the value of the improvements for building, fencing, clearing, water storage, and cultivation is £2589 11s., while the amount advanced under the Act is only £272. This fact shows that the workers must have been saving and fairly remunerated for their labor."

The London County Council has also appointed

ed a committee to carry out similar plans under the Small Holdings Act, 1892, 55 and 56 Vict., c. 31, which gives power to county councils to purchase or lease land and to adapt it and sell or let portions of it for small holdings. The committee was appointed in March, 1893. It has secured some land in different localities and divided it into allotments of about one tenth of an acre, charging a rental of about 8s. per plot per annum; many have been allotted, and are said to be well worked, but little can be done on account of the high price of land near London. For notices of aided farms for the unemployed, the not State-aided, see articles COMMUNITIES; SALVATION ARMY; also LABOR COLONIES.

Of Plan 7, that of State factories, or industries organized directly to employ the unemployed, there has been no experience. The famous National Workshops of Paris in 1848 were probably not conducted as an experiment in good faith. (See ATELIERS NATIONAUX.) Of Government industries not conducted for the unemployed there has been much experience, usually successful. (See articles MUNICIPALISM; MONOPOLIES; SOCIALISM; GAS; ELECTRICITY.) Plan 9, that the State should increase its ordinary public works and distribute a part of such undertakings in winter, can be best studied under articles CONTRACT LABOR; MUNICIPALISM; MONOPOLIES. Plan 11, that all work should be done by residents, may be considered a part of Plan 10. (See above.) Plan 6, that the State should improve intelligence offices or establish free employment bureaus, is discussed at length by the Massachusetts Bureau. European governments have done something in this direction. (See article LABOR EXCHANGES.) In America a beginning has been made.

Free public employment offices were created in the State of Ohio on April 28, 1890. The statute governing such offices places them under the supervision and control of the Commissioner of Labor Statistics. In 1892 the present Commissioner, Hon. W. T. Lewis, said of them:

"To state that all wants are satisfied, and that each applicant is sent on his or her way rejoicing, would be to announce the advent of the millennium, a period which, the most optimistic must acknowledge, lies yet some distance in the future. Necessarily there are many disappointments. These are due partly to impractical ideas entertained by both employer and employee, and again, it must be confessed, by the inability of the office to meet many wants that are not impractical. The truth of the matter is,

the system is still in its infancy, it will require time and much intelligent effort to perfect it. The absence of precedent by which to be guided, the pre-existing prejudice in the public mind against employment and intelligence offices owing to the odium which has attached to the private concerns, the almost total lack of means of advertising, and the many annoyances incident to any new departure, have tended to retard its development. But in spite of all these hindrances substantial progress has been made. In the communities in which the offices are located many firms depend upon them almost exclusively in securing help, and thousands of employees could testify to their usefulness out of personal experience. The offices have benefited not only the large cities, but the adjacent farming communities have used them to quite a considerable extent, as have also business men in the smaller towns and cities throughout the State. The private intelligence office evil has been completely eradicated in three of the cities (Columbus, Toledo, and Dayton) where the free system has been established, but a few of these concerns manage to still exist in Cleveland and Cincinnati. With the growth of the free offices they will eventually disappear."

Employment Bureaus.

California has followed the example of Ohio, and on July 20, 1896, a free public Labor Bureau was opened in New York City.

The report of the Massachusetts Bureau of Labor for 1890 thinks the difficulties of free employment bureaus very great, and that as much can be hoped from carefully regulated private bureaus. It admits, however, very serious evils in employment bureaus to-day. Of Massachusetts it says:

"It is certain that the atmosphere of several offices is one of deceit. Their advertisements call for '200 Protestant girls,' when the orders on hand probably do not number 20; for 'salesladies' who are never supplied through the office in question; for 'farm superintendents, \$20 to \$60,' the highest salary ever secured for a farm superintendent in one respectable office having been \$43. The names of certain bureaus, 'Christian Benevolent Association,' 'Mutual Employment Bureau,' are suggestive of practices very different from those which actually obtain . . .

"One scheme somewhat prevails whose success depends largely upon the stupidity of the candidate, and somewhat upon a present fault of the general system. A girl applies for a housemaid's position in a first-class boarding-house in a certain locality and at a specified wage. On registration she is encouraged to pay the fee in advance. She is now expected to remain in the waiting-room during office hours. If absent at any time during the next few days she may be told that she has lost just such a situation as she desired, and if possible is induced to pay another fee. A girl has been known to pay three fees in as many weeks to the same office without obtaining a place. A candidate who is sufficiently informed to ask for the return of a fee if employment is not furnished at the end of six days may be told that she has forfeited the fee and lost positions by being absent from the office. There are indications of other practices by which fees are obtained. . . .

"For instance, an employer has hired the servant in the office, has paid her own fee, and probably been asked to advance the fee and car-fare of the girl. The girl fails to arrive. If the employer complains to the office, the keeper disclaims all responsibility, and says that another girl shall be furnished. In case a return of fee is preferred, it will be obtained only after a disagreeable scene. An employer usually tries another office, and abandons the fee.

"It is also alleged that bureaus recommend worthless men for employment, especially on farms; send farm hands away to bogus places at a distance, trusting that they will never come back; enter into collusion with bogus employers and with employment offices in other cities, so that a double fee is collected from large gangs of men; and decoy women to houses of ill-fame. There is or has been more than a grain of truth in all of these charges.

"True, very few specific complaints reach the police, the number of cases investigated by captains last year being only 72, and the number carried up to the Police Commission only three. This is a small proportion among 126 license holders; but it only proves the passive and somewhat helpless attitude of the police department. In general, it appears as if that the present regulations are ill planned to reward the honorable bureaus and to prevent abuses.

Evils of Private Bureaus.

"In the *Report of the Bureau of Statistics of Labor for 1893* it is stated that returns nearly complete, from the licensed bureaus of Boston, indicated that about 600,000 persons had applied to them during one year, and that about 125,000 places had been secured. The figure may be an exaggeration, but if we accept it, and assume that two thirds of these were female, and that only the regular fees were imposed, this would represent an expense to those seeking employment of about \$80,000. Perhaps the fees paid into the unlicensed bureaus would raise this sum to \$150,000. . . .

"In the philanthropic bureaus which are on a business basis the question of what to do with the incompetent is uppermost. Their philanthropic character naturally attracts to them many women who have their living to earn, but who are unfitted for any business. For these some work must be provided. The half dozen regular intelligence offices which aim to furnish only first-class help, and which depend for their profits on the fees of employers rather than the fees of employees, do not encourage the incompetent

applicants to register in their offices, but refer such to the philanthropic agencies. . . . Employers state that help obtained at the philanthropic offices is, more often than not, unsatisfactory. The testimony of the better class of workwomen as to the opportunities for getting employment there is likewise unsatisfactory. . . .

"It is obvious from the evidence which has been presented that the downright abuses which exist in the women's offices are graver than those which exist in the men's offices, irregularities in the latter taking the form of quasi-legal evasions. A reason for this may be found in the ignorance and inexperience of the female applicants. . . .

"The competition among men is keener. Nearly every man is expected to be self-supporting, but the number of places is not always equal to the number of aspirants for work. Hence the chronic problem of the unemployed. Whereas, among women the supply adjusts itself to the demand, and hence, while it is a matter of common knowledge that in the women's bureaus even the incompetent are able to obtain situations (tho at the expense of the welfare of their employers), the men's bureaus are frequently unable to place even the most capable and best-recommended candidates on their waiting lists."

Plan No. 12, of labor colonies for the unemployed, has been much discussed. An account of the European labor colonies will be found under that heading, but these only are for the lowest and most worthless class of the unemployed.

Mr. Edward Bellamy (*q.v.*) suggests the following plan in the Massachusetts report. He says :

"The idea is that they should support one another. They should consume one another's products. Their product should not be sold or go into the general market at all, to compete with wage-produced goods or with private employers, but should be consumed wholly within the group of previously unemployed workers.

"Now, here is where the duty and function of the State come in. These men need to be organized and provided with tools in order to support one another, and they cannot organize themselves. This it is proper to expect the State to do, both for the welfare of an unfortunate class of citizens, and also for the relief of individuals and the public treasury from the burden of supporting them by alms which must otherwise be assumed. It will be observed that this is not a question of charity or police. For the incapable, the almshouses would remain ; for the vicious, the jails. It is merely the question of putting able-bodied persons in a position to support themselves. The idea is to furnish the necessary machinery to utilize an existing power which otherwise will run to waste. The State would be at expense to provide the necessary farms, manufacturing plants and buildings, and, for a time, until the products began to come in, it would have to keep the workers ; but, after that, the system ought to be self-sustaining. At the outset, as intimated above, while yet the system was inadequate and imperfectly organized, it might be necessary to discriminate among applicants in favor of legal residents ; but as soon as the system should become self-sustaining, it would not be necessary or well to make any discrimination whatever.

"This contemplates a permanent establishment, for it is nonsense to regard the problem of the unemployed as anything but a permanent problem. This establishment would undoubtedly always be in operation, altho the number dependent on it would increase and decrease according to the times. It would be an elastic system, and, after it was in full adjustment, a man or woman out of work could get work for a week, a month or a year, according to the circumstances of each individual case. In each settlement of the unemployed there would be the farm, the factories, the dwellings, and the store. This store would be stocked with products of the workers, altho at first the State would have to furnish many deficiencies. The workers would from the first be guaranteed a decent and sufficient maintenance, nothing more. For this purpose they would be supplied with a sort of scrip, good only at the public store for meals, and for lodging at the public dwellings. The only practicable plan would be to make the allowance for each worker the same without regard to specific performance, it being the duty of the manager to see that all were kept busy,

able-bodied persons only being received. Women, of course, would share equally with men. The only penalty for idleness or infraction of rule would be dismissal.

"The prices to the workers in scrip of the articles for sale to them in the public store would be based on a rough calculation of the comparative expenditure of labor, direct and indirect, in their production. If the allowance of the workers were based on the specific work done by them, the fixing of its value by the price put on the product would be a task of much difficulty, fruitful of discontent ; but, the allowance of all workers being equal, it would matter to none what prices were put upon his product.

"The use of the scrip would serve the double purpose of insuring the support of the workers out of their own product, and preventing any derangement of the general wages market as a result of the State system. When the advance of money made by the State to the system came to be repaid, it might be done in products of the system furnished to State institutions at market rates. In this way, also, might such sums be obtained as would be needful to supply the stores in the unemployed settlements with imported necessities, and for other details of expense which must be met in legal tender money.

"After the expenses of the State superintendence and other outlays were provided for, the total product should be divided in the form of scrip among the workers, so that, as the total product increased, the rate of maintenance would increase, the system being one of cooperation under State superintendence and guarantee.

"In order to provide a certain basis for increased issues of scrip among the fluctuating body of employees, it would be expedient to grade the workers according to the length of their service, only those who had worked over a certain number of weeks or months being entitled to share in the excess of product over minimum maintenance rates, the rest being entitled only to the latter. The first grade of workers, it is believed, would find the advantage of their position so superior to those of outside workers that they would tend to become a permanent body, the fluctuations in the force chiefly affecting the short-term workers at minimum rates.

"The workers should be regarded as in no way objects of charity or wards of the State, but, while subject to strict working rules, should in all other respects be as free and independent as other citizens. This point is absolutely vital. If the system had ever so little the flavor of charity, or alms, or the workhouse, no cleverness of machinery could prevent its flat failure. No working man or woman should be made or permitted to feel that in applying to the State establishment for work he or she in any way compromised dignity or self-respect.

"While the State works would be intended, at the outset, to attract only the needy unemployed, it is probable that the advantages resulting from security of employment and the steady rise in the rate of maintenance which would follow the increased efficiency of the system would suffice not only to retain all who once entered this cooperative service, but to raise the conditions of labor generally by compelling private employers to bid against a fair and humane system of employment in order to obtain workers, while, at the same time, making it easier to maintain good wages by diminishing the pressure of the unemployed for work at any price."

By no means, however, do all socialists agree with Mr. Bellamy. The unemployed as a class must be recognized to be inefficient, tho often without being to blame for that fact. To put them, therefore, in colonies by themselves, whatever efforts were made to make the work honorable, would inevitably stigmatize these colonies as colonies of the inefficient, and often at least with truth. It would tend also to stigmatize State work as poor work. For these reasons most socialists object to organizing the unemployed in permanent colonies by themselves. They would have the State act, but in other ways. There is no one way of meeting the unemployment problem. The first thing is to distinguish between different classes of the unemployed. Says Mr. John Burns :

"Until the differentiation of the laborer from the loafer takes place, the unemployed question can never

Labor Colonies.

be properly discussed and dealt with. Till the tramp, thief, and ne'er-do-well, however pitiable he may be, is dealt with distinctly from the genuine worker, no permanent benefit will result to any of them. The gentleman who gets up to look for work at mid-day, and prays that he may not find it, is undeserving of pity. I have seen the most genuine and honest men at meetings mixed up with the laziest and most drunk-en scoundrels."

Most socialists would say that for the present at least the vicious and incorrigibly lazy should be placed in reformatories somewhat on the Elmira plan (see *ELMIRA REFORMATORY*), and taught or be made to work. Many of them merely need teaching under strict discipline. The incompetent should be placed in industrial schools. For the rest, work should be given on the following plan: 1. The reduction of the problem to its lowest terms by the establishment of free State labor bureaus to find work in private places for all for whom work can be found. 2. The limiting of the problem by allowing the municipality to find work only for those who can prove residence of some length of time in the city. Otherwise the unemployed of the whole country might be attracted to one city. 3. For *men*, the giving of work to actual citizens really without work, on city improvements actually needed, which would not be built by private capital, the skilled men to be employed at skilled work and unskilled men at unskilled work, and all at trade-union hours for trade-union wages in their respective lines. The money to do this could be gained in two ways: first, without raising taxes, by profits from municipal activities. Berlin gains half her income from municipal activities. Glasgow and other cities show similar results. If this policy should check the employment of men by private corporations, the city would employ more than the corporations discharged, because the city would employ them for shorter hours, and on a larger plan. Municipalities can employ more men at higher wages than private corporations, and yet make money. Secondly, revenue should be raised by the increase of taxes on land values, preventing land speculation, compelling building, and therefore aiding employment. In making modern cities clean, healthy, and beautiful, there is work enough to be done. For *women*, many socialists believe that if the manufacture of clothing for sale was forbidden in the tenements (see *SWEATING SYSTEM*), if factories were built where all clothing could be made like any other commodity, under strict regulations as to hours, without child labor, and if all men had work at wages enabling them to support their families, it would be easy to supply honorable work for unmarried women, widows, and those in need. This is the ordinary socialist program for the unemployed rather than the establishment of colonies, at least until socialism brings in further changes.

Individualists, fearing State work, would emphasize manual training, temperance, thrift, etc.; but for their program, which is general rather than specific, see *INDUSTRIAL EDUCATION*; *TEMPERANCE*, etc.

In Germany and Switzerland some steps have been taken in the direction of unemployment and insurance, but it is yet too early to judge of its results.

References: Geoffrey Dredge's *The Unemployed* (1894); J. A. Hobson's *Unemployment* (1896).

UNION LABOR PARTY.—This was a political party organized at Cincinnati, February 23, 1887, mainly by representatives of the farmers' organizations of the West and Western Middle States, with many of the old Greenback Party (*q. v.*). Its platform declared for a graduated land and income tax; governmental telegraphs and railroads; abolition of national banks; free coinage of silver; payment of national debt at maturity; exclusion of the Chinese; woman suffrage; arbitration of labor disputes; and against contract labor in prisons, the further issue of interest-bearing government bonds, and the employment of armed men by private corporations. It polled an insignificant vote, but led to the formation of the People's Party (*q. v.*).

UNITARIAN CHURCH, THE, AND SOCIAL REFORM.—The first large distinct enterprise in the direction of social reform undertaken by the Unitarians of the United States was what they still call the Ministry-at-Large in Cities.

Joseph Tuckerman devised the plan for this ministry. He recognized the fact that in churches organized as Congregational churches are there is great danger that it will not be anybody's special business to attend to strangers, or, indeed, to families which may have been for a long time residents in any town, but from indifference, or bashfulness, or poverty have not connected themselves with any of the established churches. The proposal was favorably received and was realized in Boston by what is called the Benevolent Fraternity of Churches. Similar arrangements exist among the Unitarians of the larger cities of England and in several of the larger cities of America. They provide free chapels and churches, where any worshipers may attend without charge, with classes, reading-rooms, libraries, and social gatherings open to everybody.

Dr. Tuckerman and his associates in Boston gave themselves energetically to the improvement of legislation in regard to poverty and to giving scientific system to the public charities. Boston owes to them the Industrial Aid Society for the **Reform** Prevention of Pauperism, a busi- **Movements,** ness which is entirely distinct from the relief of poverty. In sixty years of successful work this society has demonstrated the possibility in a large city of keeping in check pauperism as distinct from poverty.

The mere conditions of their existence led the New England Unitarians to take cordial interest in temperance work. Among the pioneers in the public movements for total abstinence and temperance were some of their leading clergymen.

Their early advocacy of efforts for universal peace dates to the time of the Napoleonic wars. On the occasion of the fall of Napoleon, King's Chapel was opened for a public service of gratitude, in which the Unitarian clergymen of the city and neighborhood took part. At the same time Noah Worcester, the editor of *The Christian Disciple*, published a pamphlet, still remembered, which he called *A Solemn Review of the Custom of War*. The universal grati-

tude for universal peace was favorable for the consideration of such writings. Dr. Worcester changed the name of *The Christian Disciple*, so that it was known as *The Friend of Peace*. He had the sympathy and cooperation of Dr. William Ellery Channing, at that time the honored leader of the Unitarian communion of America, so far as leadership belongs to philosophical inquiry or to the statement of fundamental theological opinion; and, as an immediate consequence of solid work done by the pen and in the pulpit, the Massachusetts Peace Society was formed in the year 1816. The organization of this society was eventually merged in the American Peace Society, which has continued to this day.

So soon as the Civil War broke out the Unitarian body of the country was called upon for the assistance of the army in the field, with methods wholly without precedent.

Institutions. Such duties as were involved belonged, indeed, to all the churches of the North. Nor did the Christianity of the North in the least flinch from the duties imposed. But the Unitarian churches were, for such affairs, in what may be called an advance position. Necessarily, from the very make-up of their body, they had from the beginning been pledged to opposition to the institution of slavery. When the war broke out they had but four churches in the Slave States. Their Northern churches had, in one way and another, all protested against the institution whose existence had brought on the Civil War. The leader, if the phrase may be used, of the Unitarian churches, Dr. Henry W. Bellows, the minister of All Souls' Church in New York, consecrated himself to creating the Sanitary Commission.

But Dr. Bellows had much more in mind than the simple physical relief of the soldier. At the very beginning of the war he looked forward to the necessity of keeping the people of the North in sympathy with the struggle in the field, which was so far away from their homes. The Sanitary Commission, and the Christian Commission, formed after its model, kept the people of the North in touch with the army in a closeness of sympathy such as the world had never seen before.

The president of the Eastern branch was Dr. Bellows; the president of the Western branch was Dr. William Eliot, the minister of the only Unitarian Church in St. Louis, one of the four Unitarian churches in the South. More than ten years before, this church had emancipated all the slaves who were owned by its members, that its skirts might be clear from any taint of the institution which its pulpit was condemning. This connection of the Unitarian churches with the great charities of the war is important in their history, because the foundations were then made for what may be called a system of church action in charity such as had not existed in our churches before. The organizations then formed have since been forward in the promotion of what has since been known as the work of charity organization, or the work of the Associated Charities through the whole country.

EDWARD EVERETT HALE.

UNITED LABOR PARTY.—This party was organized in 1886 in New York, and based upon the single tax principle. Henry George, one of its chief promoters, was nominated by it for Mayor of New York in the same year. He received over 68,000 votes as against over 90,000 received by the Democratic and over 60,000 by the Republican nominee. The following year a convention was held at Syracuse, the organization of the party was perfected, and measures taken to spread it through the State. Henry George was nominated for Secretary of State of New York. In the election he received 70,055 votes against 469,888 for the Democratic, 452,811 for the Republican, and 7622 for the Progressive Labor candidate. The United Labor Party declared in its platform that it does not seek to "secure any forced equality in the distribution of wealth, nor propose that the State shall take possession of land, and either work it or rent it out," but that its aim is to abolish all restrictive taxes upon industry, to remove the tax from improvements and increase the land tax. Its platform advocated government ownership of telegraphs and railroads; prohibition of child labor and competitive convict labor; reduction of the hours of labor; prevention of the abuse of the conspiracy laws; legal and judicial reform; and a mode of election that would check bribery and corruption by relieving the candidates of expense. After this election its chief promoters mainly united with the Democratic Party in the hope that party would lead in a battle for free trade, and thus, by abolishing protective taxes, pave the way for the single tax (*q.v.*).

UNIVERSALIST CHURCH AND SOCIAL REFORM, THE.—Central in the Universalist thought has been the doctrine of the universal Fatherhood of God and the universal brotherhood of man. It was natural, therefore, that the Universalist Church should have been strongly predisposed to social reform. It has believed in working more for a kingdom of God on earth than for the salvation of men for another world. The clergy of the Universalist Church were almost without exception on the anti-slavery side of that great controversy; but the Church has been most conspicuously identified with the temperance and anti-capital punishment movements. Few men have been more widely known as social reformers, using the phrase very broadly, than Alonzo A. Miner, a Universalist clergyman in Boston, who was known throughout the land as a prohibitionist, and who was at one time the prohibition candidate for governor of Massachusetts. Dr. Miner was also prominently identified with the educational interests of New England, and perhaps the most conspicuous leader of a half score of other moral reforms. The Universalist Church has in its annual conventions for the last thirty years declared emphatically for legislative reform on the temperance question, often taking the radical ground of prohibition.

For the abolition of capital punishment, perhaps the two most conspicuous names were those of Rev. Charles Spear and Rev. George

W. Quimby, D.D., both prominent clergymen in the Universalist Church, and the latter for many years editor of the *Gospel Banner*. The abolition of capital punishment in Maine was probably due in large measure to the great personal influence of Dr. Quimby. Rev. E. H. Chapin, D.D., the eloquent contemporary of Henry Ward Beecher, was for many years identified with the Peace Reform, altho he did not go to the length of advocating non-resistance.

Mary A. Livermore was identified with the Universalist Church and assistant editor of a Universalist journal at the time she was so prominently associated with the Sanitary Commission, the Western branch of which she so largely assisted in organizing. Clara Barton, another Universalist woman, was prominently identified with the hospital service in the War of the Rebellion and the organizer of the American Society of the Red Cross (*q.v.*).

The Rev. Adin Ballou was not only an ardent advocate of the anti-slavery cause, but was the founder of the Hopedale Community (*q.v.*), the most celebrated community in America, with the single exception of the one at Brook Farm. It was a sincere attempt on the part of its founder to solve some of the problems of competition by a simple form of cooperation. The Universalist Church is also abreast with the current discussions and advance movements for applied Christianity, having one of the three well-known institutional churches of Boston. The Every-Day Church was founded in 1894. The year-book of the Universalist Church for the current year gives the following account of the purpose and scope of the enterprise: "The Every-Day Church, located at 397 Shawmut Avenue, Boston, is a religious and philanthropic institution under the auspices of and supported by the Universalists of New England. It is an 'institutional' church which seeks to maintain all the spiritual activities of the church in its old form, and besides to maintain various secondary philanthropic institutions, such as day nursery, kindergarten, young men's recreation room, industrial classes, etc., children's outing, flower work, etc. Pastor, Rev. George L. Perin, D.D.; pastor's assistant, Miss Alberta D. Garber." In the literature of social reform the Rev. F. W. Hamilton, of Boston, has written an important work, *The Church and Secular Life*.

GEORGE L. PERIN.

UNIVERSITY EXTENSION MOVEMENT, THE.—The movement known as University Extension had its origin in England early in the seventies. It seems to have come as a natural result of a demand for wider educational opportunities on the part of the adult population, and especially of the women of the country. The need for such opportunities had been already more or less consciously felt by the universities themselves, and the first formal expression of a desire for more knowledge met an immediate and willing response from the centers of learning. The courses given by Mr. James Stewart to women's clubs in the north of England in 1868, and subsequently to differ-

ent bodies of working men, may fairly be counted as the pioneer effort of the movement. The success of these courses led to a widespread demand from many towns in all parts of England, and at the request of Mr. Stewart himself the University of Cambridge, in 1872, gave a formal sanction to these extra-university lectures, and appointed a syndicate to control them.

The scheme of adult education thus instituted embraced on the part of the university the offering of systematic courses of lectures on the various subjects in history, literature, and science. The number of lectures in each course was fixed at 10, these to be given weekly, and followed in each case by a subsequent conference or "class." A syllabus giving an outline of the lectures and full indications for reference reading, with questions for weekly paper work, became soon an additional feature. The course was crowned by the University through a final examination—a somewhat rigid test—which was graded from the first by University standards. With the progress of the movement many additional features became an integral part of the system. Oxford University, which followed the lead of Cambridge in 1876, and began again its efforts with great vigor in 1885, is to be credited with the idea of the traveling library, containing perhaps half a hundred books on the subject-matter of each course which is offered to the center for the period of the lectures. Oxford, adopting the Chautauqua idea, instituted in 1888 a Summer Meeting for Extension students, which has attracted each year increasing numbers for a longer or shorter period of resident study. A society to supplement the efforts of Oxford and Cambridge, and to organize Extension courses in London, was founded in 1878. These three bodies, with the addition of Victoria University, have formed some 400 centers in England, and under their direction courses are now being given with an aggregate attendance of between 60,000 and 80,000 students.

The spread of University Extension in America has been very rapid. It was undertaken for the first time by a society in Philadelphia at the suggestion of Provost William Pepper, of the University of Pennsylvania. The first course was commenced in November, 1890, and during that year 43 series of six lectures each were given at 23 centers to an estimated attendance of 10,000 students. The results of the first year led to the establishment of the American Society for the Extension of University Teaching, with headquarters in that city. The efforts of the society were directed toward the spreading of information in regard to the movement, and its officers in America, have cooperated in every possible way with people interested in the movement in every part of the country. Under the direction of its president, Dr. J. James (of the University of Chicago), the society issued many important publications, founded a Seminary for the Training of Extension Lecturers, and instituted a Summer Meeting for Extension students to supplement the winter courses of its centers. These latter have been formed in 100 towns in Pennsylvania and ad-

joining States, and systematic work has been arranged for each center, through the general offices. It is safe to say that the success at the present standing of University Extension in the United States is due in the largest measure to its generous endowment by the citizens of Philadelphia and the broad and far-reaching views of the officers of the American Society.

Through the publications of the society and the active campaign instituted by Mr. Melvil Dewey, Secretary of the University of the State of New York, the Legislature of that commonwealth set aside in 1890 the sum of \$10,000, to be used for the purposes of University Extension. A part of this money was used immediately in the distribution of explanatory circulars, and these were supplemented wherever a desire was expressed, by the personal cooperation of the organizing secretary. The library department of the University arranged for the loan of books to Extension centers, which were soon formed in many of the important towns of the State. Cornell, Columbia, Rochester, and other universities and colleges furnish the corps of lecturers. Following the lead of the American Society and the universities cooperating with it, Brown University appointed a Director of University Extension, and has conducted in the past four years courses in many towns in Rhode Island. The great State universities of the West have not been slow in undertaking similar work. The University of Wisconsin sent out, in 1892-93, lecturers to not less than 40 towns, and formed a network of centers in all parts of the State. The universities of Michigan, Indiana, Kansas, and California are others which have made active efforts in this direction. The University of Chicago included in its initial plans a Department of University Extension; a special faculty was appointed for this purpose; abundant provision was made for the organization and management of centers; plans for lecture and class courses, with special facilities in the form of traveling libraries, were matured, and in 1895-96 more than 120 courses were given in Chicago and throughout Illinois and the nearer parts of adjoining States. Strong efforts are making, especially for logical sequence in subjects and the building of efficient and permanent local organizations.

The bibliography of University Extension includes already many important pamphlets and books, with a long list of timely magazine and newspaper articles. Among the most important are the following: Mackinder and Sadler, *University Extension, Past, Present, and Future*; Roberts's *Eighteen Years of University Extension*; James's *Handbook of University Extension*; *Proceedings of First National Conference on University Extension*, 1891; Moulton's *University Extension Movement*; and Lax Leclerc's *Le Rôle Sociale des Universités*. Important articles on the movement will be found in the *Review of Reviews*, July, 1891; January, June, and October, 1893; *Forum*, July, 1891; *Educational Review*, September, 1891; *Quarterly Review*, April, 1891; *Lippincott's Magazine*, October, 1890; *Popular Science Monthly*, November, 1891; and *Arena*, September, 1891. The following magazines are

issued in the interests of the movement: *The Citizen* (Philadelphia); *The University Extension Journal* (London, Constable & Co.). In addition to these, the American Society has issued many explanatory circulars and pamphlets, addresses, syllabuses, and reports. (Address: University Extension, Fifteenth and Chestnut streets, Philadelphia.) Circulars may be obtained from Albany on the New York State work. (Address: Melvil Dewey, Albany, N. Y.) The various colleges and universities engaged in the work issue also lists of lecture course by members of their faculties.

GEORGE FRANCIS JAMES.

UNIVERSITY SETTLEMENTS.—The university or social settlement is the product of a philosophy and the outcome of a movement.

The philosophy from which it emanated was first preached by Frederick Maurice, Charles Kingsley, and Dr. Arnold. These Christian socialists, so called, led in the demand for greater appreciation of the economic conditions and hardships of the life of the poor.

Alton Locke, by Charles Kingsley, was a first appeal to the sympathies of university men; and at the same time that Knight, by his writings, lectures, and personal influence, was calling the attention of Cambridge to the condition of the London poor, Thomas Hill Greene, by his elevated philosophy, with its strong ethical tendency, and John Ruskin, by his social enthusiasm, were teaching the same lesson at Oxford. The Oxford Movement was, perhaps, deeper and stronger, and from there we have the first positive action. In 1867 Edward Denison, an Oxford student of wealth and good social standing, called upon the Rev. John Richard Greene, Vicar of St. Philip's, Stepney in London, the author of the *History of the English People*, stating his desire to live among the poor. His untimely death, on January 26, 1870, after a short residence in Stepney, closed a most promising career.

In 1875 Arnold Toynbee began work in White-chapel with Rev. Samuel A. Barnett, Vicar of St. Jude's. He gave frequent lectures among the people on economic matters, in which he showed a broad and deep understanding of the social conditions of the poor. He died March 9, 1883, and in January, 1885, the work of Toynbee Hall was begun.

Since its founding, in 1885, Toynbee Hall has had a large number of university men in residence. A few undergraduates come during vacation, but the majority are graduates in professional life or of the leisure class. In the buildings of the settlement there are accommodations for 22 men, but the regular force averages about 15. This settlement has frequently been associated with outside local movements, supplying from among its residents a teacher at a board school, a secretary of the Children's Holiday Fund, a member of the Board of Guardians of the Poor, officers of the local school board, and like official positions.

Besides the residents' house and the library, the settlement possesses a lecture hall and a small residential college for working men, where are taught various subjects in which mechanics

Toynbee
Hall.

and other skilled artisans are interested. While its work began among the ignorant and dependent classes, there is a growing tendency to turn to the more skilled laborers, and less attention is paid the children than in the American settlements. A considerable amount of outing work is done during the summer, and an occasional art exhibition is given. The valuable work of many residents in collecting social statistics should also be named.

The Oxford House began its work in the same year as Toynbee Hall. Its first object is religious instruction. It is well equipped for its work, with accommodations for 20 residents, a chapel, library, lecture room, and club rooms. Some direct religious work is done by the residents of Oxford House, but a considerable portion of it is connected with the work of neighboring churches. The Oxford House has been particularly successful in its club work. The University Club, which is the strongest of the working men's clubs receiving outside assistance, was formed in 1885, and now has a membership of about 1500. It occupies a building of its own, in which are a billiard room, a reading room, class rooms, and a large hall used for athletics, entertainments, and dancing, and for mission services on Sunday. The membership is limited to genuine working men, and no employers are eligible; exceptions have only been made in the case of a few residents of the Oxford House. Women are granted the privileges of the rooms four afternoons in the week and are invited to the entertainments. No intoxicating drinks are sold in the club house. Residents of the Oxford House, like those of Toynbee Hall, act as district officers of various charitable, philanthropic, and municipal enterprises, and they have also done a considerable amount of sociological investigation.

Mansfield House, supported mainly by Congregationalists, is entirely unsectarian, while more positively religious than Toynbee Hall. There are usually eight or ten men in residence. There are several clubs for boys and men, and University Extension lectures are given in the hall of the settlement. The residents have shown a very lively interest in technical education. A class of teachers was conducted four nights in a week for matriculation at the London University. The head is Mr. Percy Alden.

Akin to the settlements are the missions established by various colleges at Oxford and Cambridge. The work is done by missionaries, usually clergymen, in residence. Collections of clothing and of money are obtained, the students of the college supporting the mission. **Oxford and Cambridge Missions.** Students also visit their missions, and in some are invited to become workers during the vacations, while personal reports are made by the missionaries to the supporting constituency. The religious element is usually more marked than in the settlements, and while in many the social work is of an excellent character, the scientific sociological standpoint is not so strongly maintained. Equally worthy of notice as products of the settlement movement are the school missions, those of Eton, Harrow, and Rugby being the most prominent.

These missions bear an important relation to the settlement movement for two reasons. Their method shows the extension of the settlement plan of personal sympathy and companionship in the residence of a body of workers at the mission and in the frequent visits of undergraduates and graduates of the schools, and their active cooperation by work as well as contributions for longer or shorter periods; when training of this experience is evinced by the maturer interest which many of the boys show when they go up to the universities.

Of women's settlements, the Women's University Settlement at Nelson Square, Southwark, London, was founded in 1887, and is the largest. It is supported by an associate membership of 655, mainly from Girton and Newham colleges, at Cambridge; Lady Margaret College and Somerville Hall at Oxford; and London University. The warden is Miss Sewell, of Newham College. District nursing has received much attention, and mainly through the efforts and contributions solicited by the settlement the Benson House has been established. It is the headquarters of a superintendent, a probationer, and two nurses, who take cases in two surrounding districts.

Many children in Southwark are annually sent for holidays into the country, to the expense of which the settlement obtains generous contributions. Two resident and four non-resident members of the Settlement Association are school board managers, and thoughtful enterprise has led them to aid the children's savings banks, the Saturday morning play-hour excursions to the Zoological Gardens, holidays for children in the deaf and dumb school, and agitation for technical education for those unfortunate ones.

Similar to this is the Mayfield House, Bethnal Green, London, founded in 1889, of which Miss Newman is the warden. It aims to assist parish work in the vicinity and to cooperate with the work of the Oxford House. Various classes are conducted, including cooking and sewing. Literary and social reunions for mothers are notable features, and for some time a crèche has been in operation.

In Scotland, the university settlements at Edinburgh and Glasgow differ from those of London in that, being in university towns, a much more considerable number of the residents have been students still pursuing their undergraduate studies at the universities. The founder of the first Scotch settlement, that in Pontin Street, Edinburgh, Mr. C. M. Douglas, was at the time of its initiation a student in the faculty of arts.

It is only to be noted that the Scotch settlements have not secured men of so much maturity of years and experience as those in London, nor have they received such strong financial backing. Their buildings are plain but substantial. They have not attempted so much of political or municipal reform, but have more concerned themselves with the moral and social influences of family life and individual character, yet the Edinburgh settlements have made valuable studies of the social conditions of the life of the poor, and by their athletic, social, and literary gatherings have strongly influ-

enced their districts. Two university halls have also been established in Edinburgh for the double purpose of improving the social life of the students and of awakening in them a theoretical and practical interest in the social life of the poor. The Glasgow Students' Settlement, in Garscube Cross, was founded to aid the work of the University Missionary and Total Abstinence societies, but has separated from them and has been reconstructed on a more independent basis. Nevertheless, owing to this connection, temperance and religious effort have always had an important place. The Toynbee House, in Cathedral Court, Rotten Row, Glasgow, has taken Toynbee Hall as its model more than perhaps any of the other Scotch settlements. It has established its house in one of the buildings of the Glasgow Workman's Dwellings Company, and has shown peculiar interest in the housing of the poor in that city. It has also social and literary clubs for men, and girls' and women's clubs for instruction in sewing, cooking, and music, and a small circulating library is managed with success.

On the Continent, the only institution at all closely resembling the settlement is the "Onshuis" at Amsterdam. It was founded by Mr. James, a merchant of wealth. Students in the faculties of law and science give lectures, and other educational and social agencies are employed to bring culture to the poor. Its interest in social and political problems is strong, but mainly from the radical and socialistic standpoint. In religion it has assumed a decidedly negative attitude. The clergymen are occasionally invited to lecture, they are pledged not to speak on religious topics, nor are these subjects otherwise discussed.

In Berlin, an attempt was made in 1890 by Paul Goehre, a theological student, to found a settlement. He had spent three months as a hand laborer in Chemnitz, and his

On the Continent.

report in *Dreimonate als Fabrik-Arbeiter* awakened decided interest in many of the German universities. Several students volunteered to become residents, but the professors did not favor the scheme, urging that the student should rather give his time to study than to practical movements. The popular belief maintained in Germany that the Government should be responsible for all lines of education and municipal reform diminished the sympathy of others, and the movement did not materialize.

While in Great Britain the men's settlements have been on the whole stronger and better equipped, both in respect to buildings and workers, than the women's settlements, in America the reverse is true. The struggle for wealth seems to leave few men willing to be content with moderate means and to devote their time to altruistic effort.

The New York University Settlement was founded by Stanton Coit, Ph.D., in May, 1887. He was afterward succeeded by Charles B. Stover, but returned to assume the leadership for the winters of 1892 and 1893. The present head worker is James B. Reynolds.

The settlement maintains a kindergarten,

clubs, and classes of a literary, athletic, domestic, and social character. It aims to supply a need for the maintenance of a free library with 3000 volumes. At present it is patronized mainly by the children and youth of the district, as their elders are generally unable to read English. Each winter a course of lectures on social and economic subjects is given. Musical entertainments of a superior character have also been provided. Annual art exhibitions are held at the settlement, lasting for six weeks and visited by from 50 to 100,000 persons. During the summer one or more residents devote themselves to the distribution of flowers among the poor. An appeal for fresh flowers sent out through the country newspapers brings sometimes 50 boxes a day. The Sanitary Union has secured the cleaning of dark alleys and some unsanitary houses and obtained the closure of 22 sweat shops. Weekly conferences with the teachers of the Tenth Ward have been held, at which questions of education and pedagogics are discussed. During times of special distress canvass of the unemployed is made by the workers of the settlement, which has proved of decided value to movements initiated for the relief of the general distress.

The Prospect Union, or Harvard University Settlement, is located in Cambridgeport, Mass. It has done strong work along educational lines through the cooperation of large numbers of Harvard men, who have conducted classes, held discussions, and given lectures. The director is Robert Ely. The East Side House, in New York, is carried on with George Gordon as resident manager. It acts as one of the stations of the library association for the distribution of books; a successful kindergarten is maintained, but the men's club is the center of interest, and has achieved a phenomenal success.

The College (women's) Settlement Association was formed in 1890 to unite the women's settlements in New York, Philadelphia, and Boston, to aid in the financial support of the settlements, and still more to interest women in the work of social improvement. Classes and lecture courses have been conducted by all, and house visitation has been an important and successful feature.

At the New York settlement the leading efforts are a penny provident bank, library, kindergarten, clubs, and district visiting. It also has a delegate on the District Committee of the Charity Society, and has been active in connection with special relief movements. The Philadelphia settlement, besides its regular work, has done important work in political reform in the district, and the Boston settlement has distinguished itself by its interest in labor movements. The Hull House, of Chicago, is considered in a special article.

The settlement movement at the present time seems to be rapidly extending. The value of residents, which is its characteristic feature, has been thoroughly approved. In America, unfortunately, some organizations, which have no residents, but only hoped to obtain them in time, have called themselves settlements. Others, distinctly below the intellectual standards

The Settlement in New York.

of earlier settlements, and practically only evangelical missions, are using the same title. Nevertheless, the central principle of the settlement movement, the residence of a small corps of workers, and the combination of sympathy and trained intelligence in all work planned and executed have made the settlement powers for good in their respective communities, and have given their opinions on various questions of recognized value. JAMES B. REYNOLDS.

Toynbee Hall, 28 Commercial Street, London (East), founded 1885.

Oxford House, Bethnal Green, London (East), 1885.

Chalmers University Settlement, 10 Ponton Street, Fountainbridge, Edinburgh, 1887.

University Settlement, 26 Delancey Street, New York, 1887.

Leighton Hall Neighborhood Guild, 8-10 Leighton Crescent, Kentish Town, London, 1889.

Trinity College Settlement, 131 Camberwell Road, London, S. E., 1889.

Rugby House, 292 Lancaster Road, 1889.

Students' Settlement, 10 Possil Road, Garscube Cross, Glasgow, 1889.

Mansfield House, 167 Barking Road, Canning Town, London, 1890.

New College Settlement, 37 Pleasance, Edinburgh, 1890.

East Side House, Seventy-sixth Street and East River, New York, 1891.

Newman House (Roman Catholic), 108 Kennington Road, London, S. E., 1891.

Northwestern University Settlement, 26 Rice Street, Chicago, 1891.

University Hall, Gordon Square, London, W. C., 1891.

Bermondsey Settlement, Farncombe Street, Jamaica Road, London, S. E., 1892.

Andover House, 6 Rollins Street, Boston, 1892.

Association House, 259 West Sixty-ninth Street, New York, 1892.

Epworth League House, 34 Hull Street, Boston, 1892.

Minster Street Neighborhood Guild, 618 Minster Street, Philadelphia, 1893.

Whittier House, 174 Grand Street, Jersey City, N. J., 1893.

Church Settlement House, 1556 Avenue A, New York, 1894.

Chicago Commons, 140 North Union Street, Chicago, 1894.

Prospect Union, 744 Massachusetts Avenue, Cambridgeport, Mass.

USURY literally means and originally meant *use-money*, the payment of money for the use of money, and sometimes even payment for the use of any article. It was identical with our term interest. Only in modern times has it been limited to mean the taking of inordinate or excessive interest. In this article we consider the ethics of usury or interest-taking. (For the economic and other questions, see INTEREST; CAPITAL.)

Usury or interest-taking among all ancient peoples was considered sin. The Hebrew condemnation of usury is well known: "Thou shalt not lend upon usury to thy brother; usury of money, usury of victuals, usury of anything that is lent upon usury" (Deut. xxiii. 19). This condemnation occurs repeatedly in the Old Testament. (See Lev. xxv. 35-37; Ex. xxii. 25; Neh. v. 7, etc.) Ps. xv. 5 describes the righteous man as one "who putteth not out his money to usury." It is true that the Hebrew could take usury of a non-Hebrew! "Unto a stranger thou mayest lend upon usury" (Deut. xxiii. 20), but this was probably due to the or-

ganic and national conception of Hebrew morality. All races originally condemned usury. Herodotus says the Persians repudiated all buying and selling. Yet usury was everywhere practised. In Greece and Rome it gradually developed a plutocracy by putting all the small creditors into the power of the rich, and often reducing the poor to literal slavery. Aristotle ranks usury with prostitution. He says:

"Such are all they who ply illiberal trades; as those, for instance, who keep houses of ill-fame, and all persons of that class; and usurers, who lend out small sums at exorbitant rates; for all these from improper sources, and take more than they ought" (*Nicomachean Ethics*, IV., § 1).

Plato says:

"Of the two sorts of money-making, one, as I have just said, is a part of household management, the other is retail trade; the former necessary and honorable, the latter a kind of exchange which is justly censured; for it is unnatural, and a mode by which men gain from one another. The most hated sort, and with the greatest reason, is usury, which makes a gain out of money itself, and not from the natural use of it. For money was intended to be used in exchange, but not to increase at interest. And this term usury [*rákos*], which means the birth of money from money, is applied to the breeding of money, because the offspring resembles the parent. Wherefore of all modes of money-making, this is the most unnatural" (*Politics*, I., 10, 4, Jowett tr.).

Cato, on being asked what he thought of usury, asked the speaker what he thought of murder. Nevertheless, in both Greece and Rome usury was common, and laws were in vain passed against it. The opposition of the Church Fathers is well known.

Chrysostom says (*Homily on St. Matthew*):

"Nothing is baser than the usury of this world, nothing more cruel. Why, other persons' calamities are such a man's traffic; he makes himself gain of the distress of another, and demands wages for kindness, as tho he were afraid to seem merciful; and under the cloak of kindness he digs the pitfall deeper by the act of galling a man's poverty."

And again (*Homily LVI.*):

"How many have lost their very principal for the interest's sake! How many have fallen into perils for usurious gains! How many have involved themselves and others in extreme poverty through their unspeakable covetousness! . . . But what is the plea of the many? 'When I have received the interest I give to the poor,' one tells me. Speak reverently, O man; God desires not such sacrifices. Deal not subtly with the law. Better not give to a man, than give from that source; for the money that hath been collected by honest labors, thou often makest to become unlawful because of that wicked increase; as if one should compel a fair womb to give birth to scorpions. And why do I speak of God's law? Do not even ye call it filth? Why, are there not many honest trades—in the fields, the flocks, the herds, the breeding of cattle, in handicrafts, in care of property?"

Basil says (*Second Homily on Psalm xiv.*):

"In truth, it is the last pitch of inhumanity that one man, in the need of the bare necessities of life, should be compelled to borrow and another, not satisfied with the principal, should seek to make gain and profit for himself out of the calamities of the poor. The Lord gave His own injunction quite plainly in the words, 'From him that would borrow of thee, turn not thou away.' But what of the money lover? He sees before him a man under stress of necessity, bent to the ground in supplication. He sees him hesitating at no act, no words of humiliation. He sees him suffering undeserved misfortune, but he is merciless. He does not reckon that he is a fellow-creature. He does not give in to his entreaties. He stands stiff and sour. He is moved by no prayers; his resolution is broken

by no tears. He persists in refusal, invoking curses on his own head if he has any money about him, and swearing that he is himself on the lookout for a friend to furnish him a loan. He backs-lies with oaths, and makes a poor addition to his stock in trade by supplementing inhumanity with perjury. Then the suppliant mentions interest, and utters the word security. All is changed. The frown is relaxed; with a genial smile he recalls old family connection. Now it is 'my friend,' 'I will see,' says he, 'if I have any money by me. Yes, there is that sum which a man I know has left in my hands on deposit for profit. He named very heavy interest. However, I shall certainly take something off, and give it you on better terms.' With pretenses of this kind and talk like this he fawns on the wretched victim, and induces him to swallow the barb. Then he binds him with written security, adding loss of liberty to the trouble of pressing poverty, and is off. The man who has made himself responsible for interest which he cannot pay has accepted voluntary slavery for life. Tell me, do you expect to get money and profit out of the pauper? If he were in a position to add to your wealth, why should he come begging at your door? He came seeking an ally, and he found a foe. He was looking for medicine, and he lighted on poison. You ought to have comforted him in his distress, but in your attempt to grow fruit on the waste, you are aggravating his necessity. Just as well might a physician go in to his patients, and instead of restoring them to health, rob them of the little strength they might have left. This is the way in which you try to profit by the misery of the wretched. . . . You call this profit, you get from these sources kindly and humane! Woe unto them that put bitter for sweet and sweet for bitter, and call inhumanity humanity."

Of the man who has borrowed on interest Basil says further on :

"At first a man is bright and joyous; he shines with another's splendor. . . . But the money slips away. Time as it runs on adds the interest to its tale. Now night brings him no rest; no day is joyous; no sun is bright; he is weary of his life; he hates the days that are hurrying on to the appointed period; he is afraid of the months, for they are the parent of interest. . . . Usury is the origin of lying, the beginning of ingratitude, unfairness, perjury."

Such are examples of the position of the Fathers. Council after council forbade usury, especially upon the part of the clergy. Yet it grew. It was gradually allowed, even by the canon law under the form of one exception after another. It was, however, still condemned on principle. Protestantism, too, first condemned usury, and often with unmeasured terms. The usurer's house was the house of the devil. One per cent. was enough to shut out the kingdom of heaven. Archbishop Sands is quoted as saying, "This canker [usury] hath corrupted all England;" Luther as saying, "To exchange anything with any one and gain by the exchange is, to steal." Interest was forbidden as late as an act of Edward VI. Beginning with Henry VIII., however, the endeavor was only to control the rate of interest. Calvin was the first Christian thinker to nominally allow interest. Locke, Hume, Adam Smith, and, above all, Jeremy Bentham, argued that it was justifiable. Bentham's celebrated argument was that the effort to condemn and forbid interest simply raises the rate of interest. Men at times must borrow. The lender does a real service to the borrower. Under equity he is entitled to some reward or interest. If all interest is forbidden, he will then secretly ask a higher rate of interest because of the risk run. It is also argued by those of this school that the attempt to control interest places useless and harmful checks on the natural flow of commerce.

To-day civilization is largely based on inter-

est, and few but the extremest radicals condemn it. It is held that he who lends does a real and often a very great service to the borrower, and therefore while excessive and extortionate interest is condemned, that a moderate interest is justifiable, and gives a right stimulus for saving to persons, and enables widows, colleges, and even churches, to loan capital and live upon the interest. To destroy interest, it is argued, would harm the worker and overthrow civilization. On the other hand, radicals who condemn all interest argue that labor of hand or brain is all that men ought to receive pay for, and that he who lends money lends stored-up labor, perhaps, and therefore should get back what he lends and no more, because, in the loaning, he has himself done no labor. They argue that the power which interest gives to the idler who has either himself made or inherited money to live in idleness and receive interest from those who toil is the foundation of social evils, creating classes, developing luxury, enslaving the poor to support the rich.

In *Fors Clavigera* Mr. John Ruskin, taking the view that good life only is wealth, and that exchange should only be exchange of living services, thus speaks of interest or usury :

"Usury is properly the taking of money for the loan or use of anything (over and above what pays for wear and tear), such use involving no care or labor on the part of the lender. It includes all investments of capital whatsoever, returning 'dividends' as distinguished from labor wages, or profits. Thus anybody who works on a railroad as plate-layer or stoker has a right to wages for his work; and any inspector of wheels or rails has a right to payment for such inspection; but idle persons who have only paid £100 toward the road-making have a right to the return of the £100, and no more. If they take a farthing more they are usurers. They may take £50 for 2 years, £25 for 4, £5 for 20, or £1 for 100. But the first farthing they take more than their hundred, be it sooner or later, is usury.

"Again, when we build a house, and let it, we have a right to as much rent as will return us the wages of our labor and the sum of our outlay. If, as in ordinary cases, not laboring with our hands or head, we have simply paid say £1000 to get the house built, we have a right to the £1000 back again at once, if we sell it; or, if we let it, to £500 rent during 2 years, or £100 rent during 10 years, or £10 rent during 100 years. But if, sooner or later, we take a pound more than the thousand, we are usurers.

"And thus in all other possible or conceivable cases, the moment our capital is 'increased' by having lent it, be it but in the estimation of a hair, that hair-breadth of increase is usury just as much as stealing a farthing is theft, no less than stealing a million."

In another letter in *Fors Clavigera* Mr. Ruskin, however, says :

"An impatient correspondent of mine, Mr. W. C. Sillar, who has long been hotly engaged in testifying publicly against the wickedness of taking interest, writes to me that all I say is mysterious; that I am bound to speak plainly, and above everything, if I think taking interest sinful, not to hold back stock.

"Once for all, then, Mr. Sillar is wholly right as to the abstract fact that lending for gain is sinful, and he has in various pamphlets shown unanswerably that whatever is said either in the Bible or in any other good and ancient book respecting usury, is intended by the writers to apply to the receiving of interest, be it ever so little. But Mr. Sillar has allowed this idea to take possession of him body and soul, and is just as fondly enthusiastic about abolition of usury as some other people are about the liquor laws. Now of course drunkenness is mischievous, and usury is mischievous, and whoredom is mischievous, and idleness is mischievous. But we cannot reform the world by preaching temperance only, nor refusal of interest only, nor chastity only, nor industry only. I am my-

self more set on teaching healthful industry than anything else as the beginning of all redemption; then purity of heart and body; if I can get these taught, I know that nobody so taught will either get drunk, or, in any unjust manner, 'either a borrower or a lender be.' But I expect also far higher results than either of these, on which, being utterly bent, I am very careless about such minor matters as the present conditions either of English brewing or banking. I hold bank stock simply because I suppose it to be safer than any other stock, and I take the interest of it, because the taking interest is, in the abstract, as wrong as war, the entire fabric of society is at present so connected with both usury and war, that it is not possible violently to withdraw, nor wisely to set example of withdrawing, from either evil. I entirely, in the abstract, disapprove of war; yet have the profoundest sympathy with Colonel Yea and his fusiliers at Alma, and only wish I had been there with them. I have by no means equal sympathy either with bankers or landlords, but am certain that for the present it is better that I receive my dividends as usual, and that Miss Hill should continue to collect my rents in Marylebone.

"Ananias over again, or worse,' Mr. Sillar will probably exclaim when he reads this, and invoke lightning against me. I will abide the issue of his invocation, and only beg him to observe respecting either ancient or modern denunciations of interest, that they are much beside the mark unless they are accompanied with some explanation of the manner in which borrowing and lending, when necessary, can be carried on without it."

Most Socialists hold that interest is not differ-

ent from rent or from the trader's profits, and therefore is to be overthrown, not by singling it out for especial condemnation, but by bringing in a cooperative civilization which will destroy rent, profits, and interest. A man under the system who makes or inherits money has power to-day, because there are people without money who cannot by themselves create money, and who will therefore give payment for loans of money. The landlord, the tradesman, and the capitalist all make money from the necessities of the poor by giving something to the poor and getting their promise to pay back more than is given. The capitalist rarely runs any risk, because he takes a mortgage on the loan worth more than the loan. It is, therefore, the present evil system that compels the poor to borrow. Socialists would, therefore, overthrow interest by replacing the present system by a cooperative civilization. (See INTEREST; CAPITAL.)

UTILITY. See VALUE.

UTOPIA. See MORE.

V.

VAILLANT, MARIE EDOUARD, was born in 1840 at Vierzon, France. He became a student of the *École Centrale des Arts et Manufactures*, and a civil engineer in 1862. He was also a physician and surgeon. He was a member of the Commune in 1871, and has been prominent as a socialist ever since; elected to the Municipal Council of Paris in 1884, and as a deputy in 1893, he has become a leader of the *Parti Ouvrier*.

VALUE (from Latin *valere*, to be strong, to be valiant, to be worth) is a term sometimes loosely used, even by economic writers, to include the worth of an article measured in any way. It is, however,

Definitions. increasingly used in economic science in a narrower sense to mean what a commodity will bring in exchange for other articles. Adam Smith, even in his day, clearly differentiated between *value in use* or the *utility* of an article to its possessor, and *value in exchange*, or what an article will exchange for in the market. This distinction is fundamental, and is observed by all economists. Air, for example, has great value in use. Man cannot live without air. But air has ordinarily little exchange value. Diamonds, on the contrary, with a low use value, have great exchange value. In modern terminology, however, value in use is usually called *utility*, and by *value* is simply meant *value in exchange*.

Says Professor Marshall (*Principles of Economics*, 1st ed. Book I., chap. i., Sec. 8): "Value by itself always means value in ex-

change." Says J. E. Cairnes (*Political Economy*, Book I., Sec. 1): "The sense proper to value may, I think, be said to be universally agreed upon by economists, and I may therefore define it at once as expressing the ratio in which commodities in open market are exchanged against each other."

It is still necessary, however, to distinguish *value* from the cognate words "price" and "cost."

"Price," says Professor Fawcett, "is a particular case of value." *Value* is what an article will exchange for. Price is what an article will exchange for in money (*q.v.*).

Says Mill (*Political Economy*, Book III., chap. i., Sec. 2): "By the price of a thing, therefore, we shall henceforth understand its value in money; by the value or exchange value of a thing, its general power of purchasing."

Professor Hadley (*Economics*, pp. 91, 92) defines *price* "as the quantity of money for which the right to an article or service is exchanged," and says, "A price is a fact; a value is an estimate of what a price ought to be. . . . Value being essentially an ethical term, we may have as many different theories of value as there are different views of business ethics."

Cost is different from either *value* or *price*. Cost may be defined as the sum of sacrifices of any kind involved in the production of an article. Articles frequently sell for much more or for much less than the cost to produce—that is, their value and their price are different from their cost.

Says Marshall (*Principles of Economics*, Book V., chap. iii., Sec. 2):

"The production of a commodity generally requires many different kinds of labor and the use of capital in many forms. The exertions of all the different kinds of labor that are directly or indirectly involved in making it, together with the abstinences or rather the waitings required for saving the capital used in making it—all these efforts and sacrifices together will be called the *real cost of production of the commodity*."

Remembering these definitions, we now come to consider the important and much-discussed question of the theory of value. Passing by the innumerable small variations made by different advocates of the different theories, we may recognize two main theories of value. The value of an article is believed by one school to depend upon its *cost* of production, and by the other to depend upon its *utility*. Adam Smith, Ricardo, the classical economists, most German socialists, and most individualistic or anarchistic radicals, hold to the former view. Professor Hadley (*Economics*, p. 93) calls it the socialistic theory. On the other hand, most modern economists and most Fabian socialists hold to the latter view. Both views, however, it must be remembered, have been variously stated.

Adam Smith held that value must tend to the cost of production, because he argued that no man could afford to sell an article for much less than it cost to produce, while no man would pay much more, since
Cost Theory. he would rather produce it or cause it to be produced himself. He says (*Wealth of Nations*, Book I., chap. v.): "Labor, therefore, is the real measure of the exchangeable value of all commodities. The real price of everything, what everything really costs to the man who wants to acquire it, is the toil and trouble of acquiring it."

The followers of Adam Smith very much developed this view, but spent more time in analyzing it than in asking if it be true. Ricardo makes value depend upon the quantity of labor and the scarcity of the articles; but since most articles can be easily multiplied, he makes the quantity of labor the main source of value. Mill calls attention rather to the wages cost of labor than the quantity of labor. Cary makes the important point that value depends on what it would cost to reproduce an article at the time of its sale rather than on what it originally cost. Inventions and other elements are steadily lowering the cost of production. Articles originally made by expensive processes are continually sold for less than they originally cost, because invention makes it possible to reproduce them at a much less cost. Such are the main points as to value developed by the classical school.

From this view Karl Marx and most German socialists argue that labor (of mind or hand), being the only source of value, only the laborer should share in the result. When, under the wage system, the capitalist has a monopoly of land and machinery, the laborer, say the socialists, is compelled to work for him, and the capitalist is enabled to take a portion of the value the laborer produces, and thus to rob the laborer, who, by the theory, has produced all the value. That portion of value produced which goes to

the capitalist Karl Marx calls *surplus value* robbed from the real producer. Hence such socialists argue that if the community owned all the land and capital, the monopolist could not take from the laborer any portion of the product, and the laborer would receive the whole value of his product. Anarchists and extreme individualists would get the same result by doing away with the governmental control of monopolies which secure the monopolists in their monopoly, and, leaving every man free to obtain land and capital, secure to every worker the value he produces.

We now come to the second school. It is now denied by most economists that value depends upon cost of production, and that labor is the only source of value. As a matter of fact, value, says the modern school, has often very little relation to the cost of production. A certain quack medicine that happens to hit the public fancy can often command prices bearing no reference to the cost of production. Houses continually sell for prices often much above and often much below their cost of production; so with books, so with wines, so, indeed, with most things, even including such stable articles as grain, iron, etc. The old theory, therefore, does not explain the facts, and a new theory must be developed. Jevons was the first prominently to develop the new theory, which is often associated with his name. According to this theory, the value of an article depends upon its *final utility*. According to this, the value of an article depends upon how useful to the community another article of the same kind would be. If the community desires more medicine, more houses, more books, more jewels, more bread of a certain kind, the price is high; if the community does not desire more, the price falls. Says Jevons (*Theory of Political Economy*):

Utility Theory.

"A great undertaking, like the Great Western Railway or the Thames Tunnel, may embody a vast amount of labor, but its value depends entirely upon the number of persons who find it useful. . . . Labor once spent has no influence on the future value of any article; it is gone and lost forever. In commerce by-gones are forever by-gones; and we are always starting clear at each moment, judging the value of things with a view to future utility."

As to how far labor does affect value, Jevons says:

"But the labor is never the cause of value, it is, in a large proportion of cases, the determining circumstance, and in the following way: Value depends solely on the final degree of utility. How can we vary this degree of utility? By having more or less of the commodity to consume. And how shall we get more or less of it? By spending more or less labor in obtaining a supply. According to this view, then, there are two steps between labor and value. Labor affects supply and supply affects the degree of utility which governs value, or the ratio of exchange. But it is easy to go too far in considering labor as the regulator of value; it is equally to be remembered that labor is itself of unequal value. . . . I hold labor to be essentially variable, so that its value must be determined by the value of the produce, not the value of the produce by that of the labor."

Such, in brief, is Jevons' view. His phrase, however, has mainly given place to another. The Austrian, Professor Wirsler, has given us the phrase *marginal utility* in place of *final*

utility, as indicating the utility of an article on the margin of production—*i.e.*, on the margin of doubt, whether it be worth while to produce it or not, since it is when one is debating whether it is worth while to obtain an article or not that its value is fixed. This theory, indeed, has been mainly developed by the Austrian school of economists, the more recently the younger American economists have carried the theory even further than the Austrians. This has led to what is sometimes called psychologic economics. If value depends on how much the community desires an article, it follows that value is affected by all the psychologic elements which affect desire. Professor Patten, for example, emphasizes the distinction between pain and pleasure motives. In eighteenth century philosophy, he says, value was estimated by the pains of production, "the toil and trouble" of labor. To-day we think more of the pleasure motives, the utility of an article.

Some English authorities, like Marshall and Edgeworth, incline to a balanced view between the cost and utility theories. Professor Marshall (*Principles of Economics*, note to Book V., chap. xiv.) uses the illustration of a pair of scissors, and says :

"The 'cost of production principle' and the final utility principle are undoubtedly component parts of the one all-ruling law of supply and demand; each may be compared to one blade of a pair of scissors. When one blade is held still and the cutting is effected by moving the other, we may say with careless brevity that the cutting is done by the second, but the statement is not one to be made formally and defended deliberately."

Professor Böhm Bawerk, however, in an article in the *American Academy of Political and Social Science* for September, 1894, asks, supposing that cost does determine price, on what cost depends, and he answers, in substance :

On what wages are paid to the workers and to those who furnish the capital—on what does that depend? Not fundamentally on the workers. Except in the few cases mentioned above [work in overtime or work for other reasons than commercial], men are not free to work or not, as they please. They have to work. At what wages? They cannot long receive less wages than they can live on, according to their standard of living, but they can receive more. How much more? That depends on how much more the employer can afford to give and how strong the employees are in forcing him to give all he can. But how much the employer can give depends on the demand for the article; hence final utility is still a dominating influence.

This view, too, now widely accepted, is accepted by some socialists, and especially by most Fabian socialists. They come to the same conclusions as German socialists, but not on the ground that labor is the only source of value, or that cost determines price. They base their socialism mainly on grounds of expediency (see SOCIALISM), and argue that just because value is determined, in part, by the whims and desires of society, it is not wise to leave the individual worker subject to the whims and caprices of a changing market. Some of them argue, too, that it is just that since the individual produces no value, and society enters into all production, the product should belong not to the individual, but to society for the good of all. In conclusion, Ruskin's view, which plays more or less

into the psychologic view of the modern holders of the utility theory, must not be forgotten. He says (*Munera Pulveris*, chap. i., Sec. 12) :

"Value signifies the strength or 'availing' of anything toward the sustaining of life, and is always twofold; that is say, primarily, intrinsic, and secondarily, effectual. . . . Value is the life-giving power of anything; cost, the quantity of labor required to produce it; price, the quantity of labor which its possessor will take in exchange for it. . . . Intrinsic value is the absolute power of anything to support life. . . . It does not in the least affect the intrinsic value of the wheat, the air, or the flowers that men refuse or despise them. Used or not, their own power is in them, and that particular power is in nothing else. But in order that this value of theirs may become effectual, a certain state is necessary in the recipient of it. The digesting, breathing, and perceiving functions must be perfect in the human creature before the food, air, or flowers can become of their full value to it. The production of effectual value, therefore, always involves two needs; first, the production of a thing essential, useful; then the production of the capacity to use it. When the intrinsic value and acceptant capacity come together there is effectual value or wealth." Ruskin's view, then, is (see *Unto the Last*) that all labor should be equally paid, and thus the good workmen be rewarded not by higher pay for a given piece of work, but by being more in demand and in this sense better paid. Thus valuable work will be produced, and there will be no competition to get "cheap" work.

VENICE. See BANK OF VENICE.

VERINDER, FRED, was born in Bethnal Green in 1858. He was one of the founders and has been the first and only secretary of the Guild of St. Matthew. He was long sub-editor of the *Church Reformer*, and is secretary of the English Land Restoration League, organizer of the Red Van Movement, and contributor to various socialist papers.

VIVIS, LUDOVICO, was a Spanish philanthropist and author of a Utopia *De Commune Rerum* (1635).

VOLLMAR, GEORGE V., was born at Munich in 1850, of aristocratic family, and educated by the Benedictine fathers. He entered the cavalry in 1865, and went through the Austrian campaign. He then offered his sword to the Pope, but joined the Bavarian army in the Franco-Prussian War. Wounded and crippled for life, he set himself to complete his education, and left the hospital a socialist. He edited a socialist paper in Dresden. Banished by Bismarck's anti-socialist law, he spent his exile in France and Switzerland. In 1881 he was elected to the Reichstag, but was arrested and again banished. In 1884 and in 1890 he was returned for Munich. He is the main leader of socialism in Bavaria, and the first lieutenant of Bebel and Liebknecht, and among the more conservative of German socialists. In 1891 he published *Ueber die nächsten Aufgaben der deutschen social Demokratie*.

VOLUNTARYISM is a system of social thought developed by Mr. Auberon Herbert (*q.v.*), and advocated in his paper *Free Life*. Mr. Herbert says :

"Voluntaryism asserts the sovereignty—the self-ownership—of the individual; denies that the State, which is but a collection of individuals, possesses any larger right to use force than the individual possesses,

and, therefore, opposes all force-action on the part of the State, except for the one purpose of maintaining individual self-ownership by protecting person and property against violence and certain coarse forms of fraud. *The Free Life* opposes all force-action by the State in matters connected with religion, education, health (except where person or property is injured by an aggressive act), the professions, labor, insurance, poor law, trade, banking, drink, morality, marriage, and the taking of money for public purposes.

"*The Free Life* believes in the weapons of reason, persuasion, and example; believes in the infinite development of ideas and of human resource and inven-

tion, where men are left free; believes in a society based upon the friendly exchange of voluntary services, and not in State-made virtues or in legal persecutions of each other, or in coercion of minorities by majorities, or in the bribery of politicians of their supporters out of private property or the common compulsory fund. It is opposed to all forms of pensions and official vested interests; it denounces all public debt as fatal to prosperity and most unrighteous as regards our successors; it would sell public property and make every voluntary effort in order to get rid of existing debt, but refuses all responsibility for any debt, central or local, incurred after the year 1893."

W.

WAGES—(See also **WOMAN'S WAGES**.) We consider the subject of wages under three heads: I. The Asserted Laws or Theories of Wages; II. The Statistics of Wages; III. Real Wage Conditions; are they improving or not?

I. THE LAW OF WAGES.

There have been six main theories presented as to the law or laws governing wages. Various-ly stated by different writers, they are substantially as follows:

I. THE WAGE FUND THEORY.

This theory, suggested by Adam Smith and developed by his followers, is given up to-day by all economists in its original form, tho some, like Professor Taussig, of Harvard University (*Economics*, 1896), assert that it contains valuable truth, and when properly stated is wholly true. As originally stated it is this: Wages, like everything else, are governed by supply and demand, and in the aggregate depend upon the proportion of laborers to the capital available for employing labor, this capital being denominated a *wage fund*. Adam Smith says (*Wealth of Nations*, Book I., chap. viii.):

"The demand for those who live by wages, it is evident, cannot increase but in proportion to the increase of the funds which are destined for the payment of wages."

This hint his followers developed. Malthus and Ricardo hold the same, but argue that wages cannot rise, even by increasing the wage fund; because if the wage fund is increased and wages be temporarily raised, population, according to Malthus, always pressing on the limits of subsistence, will be enabled to expand, and the increase in the number of laborers will increase the supply relatively to the wage fund, and therefore lower wages. Ricardo says (*Principles of Political Economy*, chap. v.):

"By the encouragement which high wages give to the increase of population, the number of laborers is increased, wages again fall to their natural price, and, indeed, from a reaction, sometimes fall below it. . . . The natural price of labor is that price which is necessary to enable the laborers, one with another, to subsist and to perpetuate their race without either increase or diminution. . . . The market price of labor is the price which is really paid for it from the natural operation of the proportion of the supply to the demand; labor is dear when it is scarce, and cheap when it is

plentiful. However much the market price of labor may deviate from its natural price, it has, like commodities, a tendency to conform to it."

Similarly argue Senior, James Mill, John Stuart Mill, and most of the older writers of this classical school, tho on this subject, as on others, Mill later somewhat modified his views, and is often inconsistent.

This wage fund theory naturally leads to and did historically lead to the next theory we consider.

2. THE GERMAN SOCIALIST THEORY OF THE IRON LAW OF WAGES.

According to this theory, wages under competition can never be higher than that which will just support the laborer and enable him to renew his kind. The theory directly follows, its holders argue, from the wage fund theory as stated by Ricardo. It is true that Ricardo himself did not hold this theory, sometimes fathered upon him. He held that the condition of the laborer could be raised by education, if he could be taught by moral ways to avoid overpopulation; but the German socialists claimed that under the intense struggle to live the laborer could not be sufficiently educated, and that the only way was to stop the competition and introduce a socialism which would lead to education rather than to depend on education to lead to socialism. The economic condition, they argued, is the key to all else, and civilization creeps on its belly. Hence they argued that under competition, by an iron law (Lassalle's phrase) the condition of the laborer can never be one of more than mere existence, and the only change for improvement is to replace the competitive system by socialism.

But now a new theory arose.

3. THE THEORY THAT PRODUCTION FURNISHES THE TRUE MEASURE OF WAGES.

This theory, first clearly advocated by President Walker (*Wages Question*, 1876), argues that the wage fund theory and its socialistic corollary are wholly false, and wages depend upon the productivity of labor. Wages, it says, are not dependent upon capital, because men without capital can and often do employ labor, provided they can know that the laborers employed will produce enough value to enable

them to pay the laborers out of the product and leave a balance for the employer. Employers are able to do this—as often on a farm—by giving the laborer merely his board till the harvest comes, and then paying him more out of the harvest his labor has produced. Or he can do it by borrowing capital, provided out of the product of labor he can pay for the capital borrowed, the laborers themselves, and leave a profit for himself. Hence wages depend on product. Says President Walker (*Wages Question*, chap. viii.):

“The popular theory of wages . . . is based upon the assumption that wages are paid out of capital, the saved results of the industry of the past. Hence, it is argued, capital must furnish the measure of wages. On the contrary, I hold that wages are, in a philosophical view of the subject, paid out of the product of present industry, and hence that production furnishes the true measure of wages. . . . The employer purchases labor with a view to the product of labor, and the kind and amount of that product determine what wages he can afford to pay.”

This view has been very widely accepted in both England and America. Writers like Edward Atkinson have accepted it, arguing that the only way to raise wages is to raise the product. Mr. Atkinson says (*What Makes the Rate of Wages?*):

“In treating this question of the rate of wages, it must constantly be kept in mind that money is but the instrument of exchange, that real wages are what the money will buy, and there cannot be more real wages than the whole product less the share of capital. If, then, we can even approximate the value of the product and divide by the known number of persons employed, we then approximate the annual measure or average rate of wages in terms of money.”

Capital must be paid first, Mr. Atkinson argues, in order to induce it to contribute; but it is only paid just what is necessary in the market to obtain it, and the rest of the product goes to wages. Wages thus are a result, and their measure or rate is, and must be determined in the long run, by what the product will bring. The practical result of this theory is that the only way to raise wages is to increase the efficiency of the laborer, and so increase the product. Doing this, the holders of the theory argue, will give the laborer an ever-increasing share of an ever-increasing product. The relative share of capital, it is claimed, will fall, because as wealth increases the competition of capital will grow more and more, and thus lower the rate of interest, and leave more of the product to go to the laborer. Interest is lowest, it is argued, in the wealthiest countries, and wages are there highest. Machinery increasing, the product increases; therefore, the share of the laborer. Such is, in brief, this roseate theory held to-day by many economists and embraced by most capitalists. But few working men or radicals accept it. They argue that the facts do not support the theory. They say it is true that the rate of interest is lowest in richest countries, but that the very competition of abundant capital and temporary rise of wages force capital more and more to employ machinery, and that on a large scale, thus tending to make the laborer, and especially the skilled laborer, less and less necessary, and so throwing on the market an increasing number

of unemployed laborers, whose competition tends to lower wages, and leaves the employer with a low rate of interest, to yet accumulate large profits by multiplying small rates of profits in large concerns, while the small concerns are unable to meet the competition, and so throw their employees upon the market to compete for work, and so still more lower wages. The falling in the rate of interest does not show, say these critics, a falling in the share of capital. Capital gets its share, not only interest, but in dividends, and dividends in large concerns may be very high (as in England) where interest is very low. The fact is, they point out to-day that wealth is amassing, and that real wages are not rising, but falling, because even tho nominal wages do not fall, men are working on less and less time, and therefore receive less money because of unemployment (*q. v.*, see also Part II. of this article, “Statistics of Wages”). Wages, then, do not, so these critics urge, necessarily rise and fall with production, but are often lowest when production is highest, because a so-called overproduction discharges laborers and materially lowers their income. Hence a new theory must be sought, and we have

4. THE THEORY THAT WAGES DEPEND UPON THE STANDARD OF LIVING.

This theory, born of the so-called eight-hour philosophy (see SHORT-HOUR MOVEMENT), held to-day by most American trade-unionists, except those who are socialists, and developed at length by Mr. George Gunton (*q. v.*) in his various writings, argues that wages depend upon what the working man considers the lowest level upon which he can live. Competition, it argues, can reduce wages to the lowest limits he will work for, but not lower, because he will then starve rather than work, or so strenuously organize a strike that wages will have to rise. Now, what he will work for depends upon the standard of living in the different countries and trades concerned. An American will starve or strike rather than accept Chinese wages, because the American standard of living demands higher wages. The price of labor, like all other commodities, depends on the cost of production. A skilled laborer receives more than an unskilled, because it costs more to produce and maintain him in the standard of living necessary to his being a skilled laborer. A Chinaman receives low wages, because he will live in a low way. Wages in crafts which cannot be prosecuted all the year are *per day* higher than those in crafts which can be prosecuted all the year round, because in a portion of the year the laborer has to earn enough to keep him all the year. Wages in trades where the wife and child as well as the man habitually work (as in the cotton trade) are lower than trades where women and children do not work, because the wage of the wife and child, supplementing the man's wage, enables the family to maintain the standard of living of their class without the man's wage alone equaling that amount. City wages are higher than country wages, because it costs more in the city to live on the same plane of living as in the country. Wages in piece work are in the long

run the same as in day work, because under competition the employer cannot pay higher wages than the workman can be obtained for, and under competition the workman will always work under any system for that which will enable him to secure the standard of living he considers necessary. All these cases show, argue the holders of this theory, that wages in any country and in any trade depend, not, as the socialists say, on what will just support and renew the laborer's life, but on what will maintain and renew his life according to the standard of living he considers necessary. The one way to raise wages, therefore, argues this school of thought, is to raise the laborer's standard of living. Hence their one aim is to multiply the laborer's wants and prevent his living cheaply. If laborers are enabled, by reduction in the cost of living, to live more cheaply, wages, they say, will fall. "Bone soup" living means "bone soup" wages; economical living means economical wages. They strive to make laborers expensive. The one best way they consider to develop the workman's wants is to limit his hours of labor, thus increasing his social and educational opportunities, and so raising his standard of living. Hence the connection of this view with the short-hour movement (*q.v.*).

But this theory, like all the others, has its critics. It is argued that, however hard the laborer tries to maintain his standard, men will lower their standard rather than starve, and that when, as to-day, machinery is discharging men, these men will work for wages which will support life even far below the standard of living in their trade and country, and hence, by their competition, lower all wages. In some skilled trades intelligent workmen, by labor combinations, may long keep up their standard of wages; but unskilled laborers cannot; while machinery may enable, as in the printing trade to-day, the employer to do without skilled labor, and so reduce even the skilled laborer to the condition of an unskilled laborer competing for work. Wages thus, say these critics, do not so much depend on the standard of living as the standard of living depends on the wages men can secure.

Another theory is therefore presented.

5. HENRY GEORGE'S THEORY OF WAGES.

Henry George says (*Progress and Poverty*):

"Wages depend upon the margin of production or upon the produce which labor can obtain at the highest point of natural productiveness open to it without the payment of rent."

Wages cannot be lower, he argues, than men can get by working for themselves, without paying rent, because men prefer to work for themselves, and will only work for an employer provided he will pay more than they get by working for themselves. On the other hand, Mr. George also argues, employers will not pay more than just enough to secure the laborer, because under competition they cannot pay more than they have to. If they do pay more somebody else will pay less, and so be able to undersell them, and force them to pay lower wages.

Mr. George says (*Progress and Poverty*):

"When land is free and labor is unassisted by capital, the whole produce will go to labor as wages. When land is free and labor is assisted by capital, wages will consist of the whole produce, less that part necessary to induce the storing up of labor as capital. When land is subject to ownership and rent rises, wages will be fixed by what labor could secure from the highest natural opportunities open to it without the payment of rent."

Therefore the one way to raise wages, according to Mr. George, is to give men opportunity to labor without paying rent.

But this theory, in its turn, is contradicted by the facts. Wages are not the highest where there is most free land, but where there is least. Wages are highest not in the center of Africa, but in New York City. If it be said that in Africa the laborer gets a larger proportion of his produce than in New York City, it may be true, but nine tenths of 30 cents is less than three tenths of \$3. The presence of capital and machinery enables the employer to pay not only higher, but much higher wages than the employer can make on land without capital at the margin of production. It is true that the competition of labor tends to lower these wages, but the mere opening of opportunities in land cannot check this competition, because in civilized countries land without capital is useless, or so nearly useless that those with capital can afford to pay very much more for it than the man without capital, and hence in the open market will get the land, whether the price be paid to the landlord, as under the present system of land tenure, or to the government, under the single tax plan. It may be said that this will force all land to be used by those who can use it best, and so employ labor and raise wages; but with machinery constantly improving in agriculture, as in all trades, the laborer grows less and less necessary to the employer, and the competition of the laborer, replaced by machinery, can lower wages under a single tax system as well as under any other form of land tenure. Wages, therefore, do not depend on access to land.

We come, then, to the last general theory which has been propounded.

6. THE THEORY THAT WAGES DEPEND, AS IN ANY OTHER CASE OF VALUE, ON THE MARGINAL OR FINAL VALUE OF THE LABORER.

(For a full statement of marginal or final value, see VALUE.) This theory is rather a way of looking at things than the statement of a definite law. It simply states that no one law of wages exists; that wages depend on the value to the wage-payer of the laborer he is considering—*i.e.*, on the margin of employing. Each worker will get what his labor is worth to the employer at the time when his wage is decided upon. What the laborer is worth depends upon the state of the market, the ability of the laborer, the standard of living, psychological conditions, etc. The theory, therefore, simply states that no definite law of wages can be laid down. It is undoubtedly a great advance on any other, because it is undoubtedly true that wages are the resultant of many forces. All the above laws of wages contain elements of truth. Those who argue that wages depend on production are fond of declaring the wages fund theory ex-

ploded; but, as Professor Taussig says (*Wages and Capital*, p. 37):

"In whatever sense we use the term capital, it will still appear that current wages, considered with reference to any but a very short period of time, are derived in the main from capital."

Thus the wage fund theory has some truth. The socialist theory certainly has some, for under competition wages do tend to what will just support life. So with all the theories. The standard of living, the margin of production, the productivity of labor, do all affect wages. Wages are the resultant of many economic forces. This seems to-day all that economy can say.

II. STATISTICS OF WAGES.

In treating of statistics, it is first necessary to ask how far they are reliable. This is necessary with all statistics, but especially with wage statistics. Says Professor R. Mayo-Smith (*Political Science Quarterly*, Vol. I., No. 1):

"Altho many recognize the desirability of statistics of wages, few people realize the difficulty of obtaining them. In the first place, there are three distinct investigations which must be carried on before our statistics of wages are of any value. The first is the inquiry, What are the wages or earnings? the second is, What are the prices of the commodities which the laborer consumes, or the cost of living? and the third is, In what proportion are the wages applied to meeting the different items in this cost of living? Each of these questions has its peculiar difficulties when one attempts to answer it. Take, for instance, the answer to the first question, wages or earnings. The great majority of laborers are now paid by the day, so that the most convenient form of answering the question of wages is to give the day-wages. But in some trades men work only a portion of the year; in others they may be thrown out of work at any time; in many they are forced to be idle part of the year; in all there are days lost from sickness and accident, and this loss is not the same in different trades. From the day's wages it is impossible to arrive at the year's earnings; and the same remark is true of weekly wages, and even of monthly. If working men kept accurate accounts of income and expenditures, we might apply to them and get the actual annual earnings, which would give us a notion of the actual income of the working class for a certain period. Even then it might be a time of commercial depression, and the actual earnings be a false index of the general earnings—even more false than the day's wages.

"Again, the wage-receiving class falls into three great bodies, men, women, and children, which of course receive different rates of wages. The distinction of sex is one easily drawn, but that between grown persons and children is not so easy to make. It is evident, however, that in answering the question, What are wages? we must have some sort of classification, and not mix up wages of men, women, and children.

"Again, the laboring class is employed in many different occupations, requiring varying degrees of skill and strength. An average rate of wages has a good deal the same doubtful value as an average income of a millionaire and a hundred of his employees; it represents neither one thing nor another."

To show how difficult the effort is to get and correctly use wage statistics, Professor Mayo-Smith analyzes the comprehensive report for 1884 of the Massachusetts Bureau of Labor, which bureau, he says, "enjoys the highest reputation of any of the bureaus."

The statement of the facts of wages upon which the report is based, obtained by personal agents directly from the pay-roll of a large number of establishments, Professor Mayo-Smith believes to be reliable. The averages drawn as to the wages of men in the same branch of the same occupation are correct, but beyond this Professor Mayo-Smith thinks the averages of very

little value. The average wages in occupations are obtained by averaging skilled and unskilled labor, an utterly misleading average. The average weekly wage paid to all men in the cotton industry is said to be \$3.44, but this is obtained by averaging the wages of overseers, at \$30 per week, and of lapmen, at \$5. Now one wage at \$30 would average as much as five wages at \$6. The result, therefore, for the majority of workers is materially misleading. Still worse are the averages of all occupations. The average wage to all employees in all occupations is said to be \$10.31. This is utterly misleading.

Says Professor Mayor-Smith:

"If, when W. H. Vanderbilt was president of the New York Central Railroad, we had obtained from statistics the average wealth of all persons employed by the company in its Forty-second Street station, of what value would it have been?"

"Perhaps I have now shown sufficiently the fallacious character of these averages drawn by the Massachusetts Bureau of Labor Statistics. This does not affect the validity of the original detailed tables. These, if they are taken, as they are said to be, from the actual pay-rolls of 210 establishments, are of very great value in forming a judgment concerning the wages received by American laborers."

So far Professor Mayo-Smith. But even this does not wholly state the case. Many statements of wages, and perhaps particularly of American wages, are open to suspicion as biased by political views. Protectionists and conservatives are usually anxious to show that American wages are high. Writers interested in reform are in danger of estimating wages too low in order to show the need of reform. Such dangers can perhaps be best avoided by giving statements as to wages prepared by both conservatives and radicals, *both of which statements should be studied by any one who would arrive at the truth.*

(a) IN THE UNITED STATES.

The leading official authority on wage statistics in this country is undoubtedly the Hon. Carroll D. Wright, United States Commissioner of Labor. We quote in his own words the conclusions he arrives at, reminding the reader, however, that, as we shall soon see, these conclusions are most seriously questioned by many scholars. In his book, *The Industrial Evolution of the United States*, published in 1895, Mr. Wright says (p. 191), speaking of wages in manufactories:

"In 1850 the average number of employees was reported at 957,059 and the total wages as \$236,755,464. In 1890 the number is reported as 4,712,622 and the wages as \$2,283,216,320. Owing to improved statistical methods, the totals for 1890 include certain elements not reported, or not fully reported, for previous years. Reducing the figures, as far as possible, to a comparable basis, the number appears as 4,286,523 and the total wages \$1,911,137,838, an increase of 3,329,464, or 347.88 per cent., in number, and of \$1,674,382,374, or 707.22 per cent., in total wages, over 1850. During the same period the average annual earnings per employee increased from \$247.38 to \$445.85, being an increase of \$198.47, or 80.22 per cent."

This statement Mr. Wright bases on census returns. Of wages in special departments in manufacturing and in other industries, Mr. Wright gives the following figures for 1891:

"Common and agricultural laborers, sums varying from \$2.50 per day in Montana to 75 cents in the Carolinas and \$1.25 in New York; masons, from \$4.50 and \$5 in Colorado and California to \$2.50 in North Carolina and \$2.50 and \$3.36 in Pennsylvania; carpenters in

New York, \$3.50; bricklayers and their helpers, \$4 and \$2.50 respectively; locomotive engineers, \$3.77; firemen, \$1.96." These wages, however, Mr. Wright tells us, "considered by themselves, convey a wrong impression of the average wages. While the pay of overseers in the carding and weaving department of a cotton factory ranged as high as \$5 per day in 1891, we find, by the examination of 64 cotton and woolen factories, scattered throughout 20 States and employing 31,657 hands, that 21,338 employees, or 67 per cent. of the total, received between 41 cents and \$1.20 per day, while only 24 employees received \$5 or more per day. The average daily wages for the industry, then, is nearer \$1 than \$5. For the same reason, the daily wages in the manufacture of iron and steel is between \$1 and \$2, altho the rates ranged from

41 cents to \$10.40 per day. Grouping a number of representative establishments of the principal manufacturing industries which employed a total of 59,784 hands, it is found that 20,969, or 35 per cent. of the employees, received from \$1 to \$1.60 per day. Therefore, the average daily wages for all classes of mechanics and operatives in factories may be considered as having been between \$1 and \$2, altho the proportionate number receiving more than \$2 per day was somewhat larger than the proportion receiving less than \$1 per day."

The wages paid by manufacturers in the different States the Census of 1890 gives as follows:

STATES AND TERRITORIES.	AVERAGE NUMBER OF EMPLOYEES AND TOTAL WAGES.		Value of Products, including Receipts from Custom Work and Repairing.	STATES AND TERRITORIES.	AVERAGE NUMBER OF EMPLOYEES AND TOTAL WAGES.		Value of Products, including Receipts from Custom Work and Repairing.

Number of establishments reporting, 322,638; capital, \$6,139,397,785; miscellaneous expenses, \$615,337,620. Officers, firm members, and clerks, average number, 426,099; total wages, \$372,078,691. All other employees, average number, 4,050,785; total wages, \$1,799,671,492. Cost of materials used, \$5,021,453,326; value of products, \$9,056,764,996.

So far the conservative and official view. We now consider the facts which make many students question the somewhat roseate statistics given above.

First, however, we must note that, even accepting the statistics collected by official investigations, there is not the steady recent advance in American wages usually claimed by official authorities. Dr. Charles B. Spahr, whose cautious and accurate scholarship is vouched for by his selection to lecture on the statistics of the distribution of wealth at Columbia University, gives, in a book published in 1895 (*The Present Distribution of Wealth in the United States*, pp. 110, 111), a table of wages based on wage returns collected for the famous Aldrich Senate Report of 1893, No. 1394 of the Fifty-second Congress, Second Session, and it is as follows:

INDUSTRIES.	Average Wages.		
	Average Wages.	Average Wages.	Average Wages.
Agricultural implements.....	\$1.38	\$1.91	\$1.72
Ale, beer, and porter.....	1.20	2.01	2.42
Books and newspapers.....	1.04	2.17	1.55
Building trades.....	1.56	2.86	2.64
Carriages and wagons.....	1.21	2.27	2.44
City public works.....	1.23	2.13	1.81
Cotton goods.....	.78	1.49	1.24
Dry goods.....	.95	1.41	2.10
Ginghams.....	.81	1.60	1.31
Groceries.....	1.09	1.65	2.14
Illuminating gas.....	1.18	2.74	1.99
Leather.....	1.26	1.94	1.63
Lumber.....	.69	1.40	1.32
Metals and metallic goods.....	1.44	2.33	2.01
Paper.....	.88	1.34	1.36
Railroads.....	2.64	2.77	2.55
Sidewalks.....	1.80	3.64	3.55
Spice.....	1.12	1.61	1.62
Stone.....	.96	1.75	1.46
White lead.....	1.15	1.75	1.40
Woolens.....	.86	1.28	1.38
Totals.....			
Average daily wages.....	\$1.18	\$2.04	\$1.69

Says Dr. Spahr :

"The wages given in the table are currency wages. In the year 1873, however, currency was worth 11 per cent. less than gold. The comparative wages in gold were therefore as follows :

DATE.	Daily Wages in Gold.
January, 1860.....	\$1.18
January, 1873.....	1.81
January, 1891.....	1.69

"In other words, wages in gold in the urban establishments reporting advanced $53\frac{1}{2}$ per cent. during the 13 years between 1860 and 1873; but during the succeeding 18 years, despite the continued advance in the productivity of labor, they lost enough to reduce the net gain to 43 per cent."

Here evidently is a fall in wages since 1873. (How, nevertheless, from these facts the Aldrich Report ingeniously if not ingenuously argues that wages have risen since 1873 we shall see in Part III. of this article.)

But these statistics are certainly too favorable to present average wages for at least four reasons. In the first place, they are confessedly wages paid in urban industries, which are notoriously higher than wages in rural sections; secondly, they are from pay-rolls as returned by the employers, and from the oldest and largest establishments, which, as a rule, pay the highest rate of wages; thirdly, they wholly ignore the enormous question of how many days in the year the worker has employment; fourthly, they are too favorable to day, because wages are now almost universally lower than in 1891. Says Dr. Spahr (*idem*, pp. 111, 112) :

"According to the latest volumes of the Connecticut Labor Report and the Massachusetts *Statistics of Manufactures*, the nominal rate of wages in 1894 had declined about 7 per cent. below the level of 1892, while the yearly incomes of laborers had been still further reduced by the lack of employment. The Connecticut report covers nearly half the manufacturing labor in that State. Directly from the books of the employing establishments were taken the numbers of employees, hours of labor, and wages for 1892, and for the period between June, 1893, and August, 1894, in which the fall of prices was most rapid and the stoppage of production greatest. It was found that a little over half of the establishments had reduced wages, and that the usual cut had been 10 per cent. The heavy losses of the wage-earners, however, came, not from reduced pay during employment, but from reduced employment. The average number on the pay-rolls had been cut down 13 per cent., and many of those nominally retained received work irregularly. All of these reductions reflected themselves in the total wage payments. These had decreased 25 per cent. If these firms were typical of the State at large, the great mass of families in Connecticut had had their incomes reduced one fourth. The Massachusetts reports are for the calendar years, and the changes are registered in the following tabular statement :

	1892.	1893.	1894.
Total value of product.. .. .	100	92	83
Average wages when employed.....	100	96	93
Total wages for year.....	100	92	84

From these statistics averaging the Massachusetts reported lowering of income of 16 per

cent., and the Connecticut lowering of 25 per cent., laborers' incomes between 1892 and 1894 fell at least 20 per cent., which would reduce the average wage of \$1.69, reported by the employers in 1891, to \$1.36 as the average wage to the American employee in urban manufactures in 1894. According to the Pennsylvania Bureau of Labor Statistics, from 1892-94 average wages fell 13 per cent. and the number employed 24 per cent.

As for wages in agriculture, the Department of Agriculture reported in 1890 the wages of the farm hand, with board, at \$12.45 per month. Since 1890 the depression in agriculture must have lowered wages at least 20 per cent., if not nominally, at least practically, by reducing employment. As to wages in mines, Dr. Spahr accepts both the statements and the conclusions of the Senate Report. He says (*idem*, p. 113) :

"The returns for mines were fortunately prepared by Mr. Joseph D. Weeks, and are singularly impartial. For the years selected for comparison, they run as follows :

	1860.	1873.	1891.
Anthracite coal (Pennsylvania)	\$1.08	\$2.51	\$1.91
Iron ore (New Jersey).....	1.06	1.94	1.31
Iron ore (Cornwall, Pa.).....	.85	1.85	1.83
Iron ore (New York).....	1.25	2.30	1.65
Iron ore (Oxford, N. J.).....	1.00	2.12	1.20
Rough average in currency....	\$1.05	\$2.14	\$1.58
Rough average in gold.....	1.05	1.90	1.58

"So few returns would indeed furnish an unsafe basis for generalization, were it not for the vast amount of labor Mr. Weeks has devoted to the question of miners' wages. The returns give average wages in what he believed to be typical mines. Since 1891, as is widely known, miners' wages have again suffered reductions, comparable only with those that have taken place in the earnings of farmers."

Thus far, it must be remembered, we have simply asked what wages are paid. We have yet in Part II. to ask what the wages are really worth measured by what they will buy, and whether the condition of the wage worker is really improving or not.

(b) WAGES IN OTHER COUNTRIES.

A General Report on the Wages of the Manual-labor Classes in the United Kingdom, published in 1896 by the Board of Trade, concluding an examination begun in 1886, says :

"The general effect of the summary of the wages census is to show an average rate of wages for men of £1 4s. 7d. per head, equal to £64 per annum if the weekly rate were multiplied by 52. Questions, of course, arise upon such a statement as to regularity of employment, overtime, and the like (which are being investigated specially in the department), but, considering that the year 1886, to which the census primarily relates, was a year of depression, and that the tendency since has, on balance, been upward, it is not considered that the figure above given is much in excess of the average weekly rate of wage of men for the average of the last few years.

"The corresponding average rate for women is stated as 12s. 8d.; for lads and boys, 8s. 11d.; and for girls, 6s. 4d.

"The proportion of men paid at less than £1 per week is 24 per cent.; between £1 and £1 10s., 53 per cent.; and above £1 10s., about 18 per cent. The great bulk of women are paid less than £1 a week, and their average wage comes out as about half that of men. Of course,

Great Britain.

these proportions only apply to that part of the industrial mass fairly represented by the trades dealt with in the tables comprised in the summary, but these groups of trades are considered to be samples of the great mass of occupations.

"The general average rate for men, women, boys, and girls, based on the actual amounts paid in wages in the previous year by the firms returning the schedules, appears to be £47 a year. This figure is based on 8073 returns, relating to 816,106 persons in private employment.

"The results obtained in the above manner are next compared with those obtained for particular industries (railway service, etc.) by other methods, the conclusion being arrived at that the broad results shown by the census summary would not be sensibly modified by including the great mass of other employments. The average rates for most of the trades tested are about the same as the average rate in the census summary, that for railway servants (men only) being £60 a year. The lower wage of agricultural laborers (estimated at £33 per annum for men) would be balanced by the more highly paid trades, such as building (£73 per annum per man).

AVERAGE RATES FOR VARIOUS TRADES.

"Turning to the particular trades dealt with in the report, we have the following summary, showing the average weekly rates for men, lads and boys, women, and girls respectively :

AVERAGE RATES OF WAGES IN THE UNDERMENTIONED TRADES, IN OCTOBER, 1886, FOR A FULL WEEK'S WORK, EXCLUSIVE OF OVERTIME.

* Women and girls.

"Seamen.—With regard to seamen, we have the following average monthly rates of wages (in addition to food) in 1892 :

	SAILING-VESSELS.		STEAM-VESSELS.	
	Home Trade.	Foreign Trade.	Home Trade.	Foreign Trade.
Petty officers.....	£	s. d.	£	s. d.
Sailors—men.....	4	0 0	5	7 1
Boys.....	3	1 0	4	2 2
	1	4 8	1	7 4

"Railway Service.—The railway returns, tho not uniform with the other tables, are important as covering practically the whole of the persons employed in railway service. They show that about 95 per cent. of railway workers are fairly constantly employed. Omitting minor departments, and women and boys, a number of details may be condensed in the following table, which shows the percentage number of men paid in 1891 at weekly rates falling within the under-mentioned limits, and the total number employed and average annual rate of wages for the principal departments of railway service.

DEPARTMENT.	PERCENTAGE NUMBER OF MEN PAID.		
	Over £1 10s.	Over £1 and up to £1 10s.	Up to £1.
Coaching.....	4.0	55.7	40.3
Goods.....	4.4	55.9	39.7
Locomotive, carriage, and wagon.....	27.4	42.7	29.9
Engineers.....	6.6	30.1	63.3

"Army and Navy.—The information with regard to the army shows that, taking the value of all the different allowances by which the soldier's remuneration is made up, as well as the pay in money, the remuneration of the private in the infantry comes out at about £40 per annum, and in cavalry and artillery at about £45. The average remuneration of all ranks in the infantry, exclusive of officers, is about £46, and in cavalry and artillery about £52 10s."

See also WOMAN'S WAGES for that particular subject, and Part III. of this article for statements as to the rise and fall of English wages. The above figures err undoubtedly by putting figures too high, as higher wages are more easily reported.

According to the United States Consular Reports of March, 1895, wages in France are as follows : Average general wage per working day of 10½ hours as an average, \$19 for men and 61 cents for women ; 67 per cent. of the laborers are reported as males, 24 per cent. as females, 6 per cent. as children, and 3 per cent. as foremen. These wages are in manufacturing industries, varying for men from \$1.79 in stone-cutting to 94 cents in chemical industries, those in textile industries averaging 97½ cents for men and 52 cents for women.

Perhaps the most careful recent study of comparative wage conditions in different countries is that made by Professor E. R. L. Gould, and embodied in the Seventh Annual Report (1891) of the United States Commissioner of Labor. He gives the following tables for different industries and different nations :

INCOME AND EXPENDITURE PER FAMILY.

INDUSTRY.	Families.	AVERAGE PER FAMILY.		INDUSTRY.	Families.	AVERAGE PER FAMILY.	
		Income from all Sources.	Expenditure for all Purposes.			Income from all Sources.	Expenditure for all Purposes.

* The English, Scotch, Welsh and Irish are here included.

Dr. Gould argues that the first condition of a true economic basis for society is that the earnings of the husband alone should be sufficient to support the family. The desertion by mothers of the home for the factory is, in his opinion, a fundamental factor of modern social discontent. Yet it is only in two cases, those of the bar-iron and steel manufactures in the United States, that the family can be supported without the addition of the earnings of the wife or the children. The second element upon which Dr. Gould insists is

that the family must have sufficient food. Here the American has the advantage of the European. The family of the American is better nourished than that of a worker in any other country. But if the American spends more on food he spends less on drink. In Europe the publican received three fifths as much as the landlord, and if the European worker would become teetotal he could add two more rooms to his home. The American, Dr. Gould thinks, does not save as

much, and he is not sorry for it. Dr. Gould's paper is notable indeed as giving expression to the first distinct protest against the doctrine that Thrift is one of the greatest of the virtues. He thinks that the practice of saving may sometimes prevent the civilization of the toiler, and is therefore morally and industrially bad.

When Dr. Gould comes to compare the statistics which he has collected concerning the foreign working man at home and the foreign working man in America, he is rather startled to discover that the average working man of American birth in the classified trades earns less than the Briton or the German. When the Briton goes to America, he increases his family, lives in a bigger house, for which he pays much more rent, eats more food, spends much more on his clothes, but spends almost the same amount on books and newspapers, tho he cuts down his expenditure on drink from 5 per cent. of his income to 3.6 and his expenditure on tobacco from 2.6 per cent. to 1.7. The greatest change in the consumption of alcohol takes place when the Frenchman goes from France to America. In France he spends 13 per cent. of his income on alcohol, whereas in America he only spends 6 per cent. The home-bred American only spends 2.9 per cent.

The average income of a family in Europe in the selected industries is £94 a year, while in the United States it is £124. The average saving is £6 11s 6d in Europe against £13 5s. in America. Dr. Gould mentions a curious fact when he analyzes Britons into English, Scotch, Welsh, and Irish. At home, measured by their earnings and their standard of living, the Scotch are the first, the English ranking second, the Welsh third, and the Irish last. In America, the Scotchman keeps the lead, but the second place is taken by the Irishman, the third by the Welsh, while the Englishman comes last.

The table showing the family budgets for the coal, iron and steel industries, classified by nationalities, bears very directly upon the immigration question. From this table it is seen that "the average workman in the allied industries of American birth earns less than the Briton or the German, tho he is ahead of other nationalities. In the relative size of his contribution to the family support he only gives place to the German, whose habits in this respect have undergone a marked change since his transplanting in the New World. The proportion of cases in which the husband actually supported the family are fewer, the total earnings of the family are less, the house accommodation is slightly inferior, a smaller per capita expenditure appears for food and clothing for the native American than for the Americanized Briton and German. In other words, in all important respects, except the consumption of alcoholic drinks, these latter seem to be living on a higher level. As regards the other nationalities, the American conserves his leadership, tho the expatriated Frenchman is not far behind.

In the coal-mining industry in Europe the proportion of persons buying books and newspapers is 12 per cent. higher than that amount in the United States, altho the average sum per head spent by the American miner is higher than that of Europe. It is also notable as indicative of the superior sobriety of the American miner that only 60 per cent. use alcohol, while 83 per cent. of the European miners are as yet innocent of a temperance pledge. The proportion among steel workers is much lower, being only 38 per cent. in America and 53 per cent. in Europe. The lowest average in tobacco is obtained by the steel workers of Europe; only 51 per cent. are said to use it, while 80 per cent. of the European coal miners smoke, or snuff, or chew.

The size of the average family in Europe is greater than that in America, but the difference is not so great as might have been expected. As a rule the total of a husband's earnings only average from 74 to 89 per cent. of the total earnings of a family.

Says Dr. Gould: "This revelation will surprise many, yet if the statistics before us mean anything at all, they teach the lessons we have outlined."

III. REAL WAGE CONDITIONS.

Are conditions improving or not? We now ask what wages really mean, and whether the condition of the wage earner is improving or not. Here, as before, we are met with opposing views, and we in brief present both.

(a) THE FAVORABLE VIEW.

Most conservative writers maintain that, how-

ever poor the condition of the wage worker is to-day, he is at least far better off than ever before in the world's history. Mr. John Rae adduces evidence in his *Contemporary Socialism* (1st ed., p. 390) "to show how greatly improved the working class standard of living now is from what it was 200 years ago in the good old times socialist writers like to sing of." He says:

"If poverty were increasing with the increase of wealth, it would show itself either in an increase of pauperism or in a decline in the general standard of living among the laboring classes or in a fall in the average duration of life, and these symptoms would be most acute in the countries that are the most wealthy and progressive." To prove that these symptoms of increasing poverty do not exist, he quotes Sir M. Hale and Gregory King, writers of the seventeenth century, to show that in their day 1 out of every 10, or, including children, 1 out of every 6 received alms. To-day Mr. Rae says it is only 1 out of 30. Wages at that time could not support the laborer. Everything was higher then except butcher meat, but half the population had meat only twice a week, and a fourth only once. The laborer lived chiefly on bread and beer, and bread was as dear as now. Fuel, light, and clothing were all much dearer. The death-rate in London was then 1 in 27, instead of 1 in 40 as now.

In the United States, Mr. Edward Atkinson takes the same roseate view of rising wages. In an article on "Low Prices, High Wages, Small Profits" in *The Century* (vol. xxxiv., pp. 569-584), he comes to the conclusion that wages during the last half century have steadily risen, while prices have steadily fallen, so that the real condition of the workman has vastly improved.

He takes from the census of 1880 the following average of wages for employes, other than foremen and overseers, in 100 establishments reporting under more than 100 separate titles, employing men, women, and children, and then carefully calculates the purchasing power of these wages based on average consumption, and comes to the following results:

	Average per Day.	Per Year.	Purchasing Power.
1860.....	\$1.33	\$399	\$1,290
1865.....	1.88	564	1,013
1870.....	1.94	582	1,337
1875.....	1.77	511	1,372
1880.....	1.71	513	1,543
1885 } est.....	1.80	540	1,800
1886 }			

He shows that the cost of the materials for food, of materials for clothing, boots, and shoes, with fuel, have fallen, representing about 70 per cent. of the cost of living on the part of well-to-do mechanics. Of rent he says:

"In some regions rents have declined, in others they have been stationary; in crowded cities they have either advanced in some small measure, or else the apartments hired for a given sum of money have not been equal to those previously occupied. So far as I have been able to compare rents, however, either those paid to a landlord or the rental value of premises owned by the occupant, there has not been, on the average, much variation from the rule affecting commodities in the period under consideration." Only the lowest class of unskilled laborers Mr. Atkinson considers not to have improved their conditions, and this because they have been temporarily displaced by machinery. He says, "While work has also been continuous and well paid for every intelligent mechanic or artisan who has chosen to control his own affairs and to make his own bargains, it has been much less continuous for many classes of factory operatives of a lower grade, and it has been absolutely intermittent

with respect to great numbers of common laborers. One of the penalties which society must pay for the application of science and invention to the useful arts is this temporary displacement of unskilled laborers from the occupations in which their work had been previously required, but which is no longer required when some new machine or improvement renders it unnecessary.

"On the other hand, without these applications of science to agriculture and to manufactures, the normal increase of population would without question tend to outrun the means of subsistence. It therefore follows that by their application, while the few are for a time left behind in the race, the many gain in welfare; the means of subsistence rapidly outrun the increase of population, and the many are thus enabled to enjoy better and better conditions of life.

"Thus the problem of 'progress and poverty' marches alongside the actual progress from poverty. This problem of 'progress and poverty' calls for the urgent attention of the student and the statesman in order to abate the great disparity of condition which becomes more conspicuous the more the general progress is assured."

Mr. Carroll D. Wright similarly argues the improved condition of the wage worker. In his *The Industrial Evolution in the United States*, and in his article "Wages" in the latest edition of *Johnson's Cyclopaedia*, he sums up the wage history of the United States substantially as follows:

"In 1633 the Massachusetts Bay Colony, by the action of the general court, made it a rule that carpenters, sawyers, masons, bricklayers, tilers, joiners, wheelwrights, mowers, and other master workmen should not receive more than 25 a day, the workman to pay his own board; but should he elect to board with his employer, then he was to receive 12d. a day. The rates of inferior workmen were to be fixed by the constable.

Skilled tailors were to be paid 12d. a day, poorer ones 8d. At the close of the seventeenth century common laborers were paid 25 a day, as they had been 40 years before. At the close of the colonial period laborers on farms were paid 40 cents a day; butchers, 33½; carpenters, 52; ship and boat builders, about 90; shoemakers, 73 cents; blacksmiths, 70 cents. Prices were uneven; there was no common market. Wheat might bring at one place 55., at another 105. \$1. Mr. Wright thinks, could then buy 1 bushel of winter wheat, 1 gallon of common molasses, a bushel of barley or of rye, 1½ bushels of corn. A common grade of wheat flour was \$16 per barrel. Butter, cheese, and meats were cheaper than now. Sugar, tea, and coffee were dearer than now. Common necessities were cheap.

"After the colonial period wages slowly rose. Laborers received in 1790, 43 cents a day; in 1800, 62½ cents; from 1800 to 1810, 82 cents per day; from 1810 to 1820, 90 cents; from 1820 to 1850, from 87½ cents to \$1. Carpenters in 1790 were paid less than 60 cents per day; in 1800, over 70 cents; in 1810, \$1.00; in 1820, \$1.13; from 1830 to 1840, \$1.40 in the Northern States. Cotton-mill operatives received until 1830, 44 cents per day; just prior to 1840, 90 cents, and from 1840 to 1850, \$1.00 per day. Woolen mill operatives were paid higher prior to 1830, being paid \$1.12. In 1840, carpenters were paid \$1.50 per day in New York, and in 1851, \$3.50. Bricklayers and their helpers received \$1.75 and \$1 respectively in 1851, and \$4 and \$2.50 in 1891. Locomotive engineers and firemen received \$2.14 and \$1 in 1840 and \$3.77 and \$1.96 in 1891, these figures being taken from actual pay-rolls. The great crises of 1837 and 1857 depressed wage rates, which did not recover before

Early Part of this Century.

1860." Comparing wages in 1860 and 1880, Mr. Wright uses the above referred to Aldrich Senate Report, calling it "a most excellent one, and indicates the general course of wages better than any other statement yet made." According to this, he says: "Wages stood at 87.7 per cent. in 1840 as compared with 100 per cent. in 1860; in 1866 they stood at 152.4 per cent. and in 1891 at 1607." "To be more correct, however," says Mr. Wright, "the rates should be taken in accordance with the importance of each industry relative to all industries. . . . On the latter basis wages have increased 68.6 per cent. since 1860 and 86.1 per cent. since 1840. . . . It is fair to say that wages in the leading industries of the country are 80 per cent. at least higher than they were in 1840.

Very many wages are double what they were at that date."

Of prices Mr. Wright says: "With this increase there has been in every direction a decrease in the working time of each day, and a general decrease in the cost of living, taking all articles into consideration. The decrease in the cost of living, however, has not been equal to the increase in wages. Rents are much higher, and so are meats and some other articles; but taking the wholesale prices of 223 of the leading articles of consumption, it is found that there has been a decrease since 1860 of about 6 per cent."

Present.

(b) THE UNFAVORABLE VIEW.

We present under this head the views of those who hold that the position of the wage earner at present is not improving, and that, at least relatively to the advance of society, it is not even equal to what it formerly was in economic status. The holders of this view do not, indeed, deny that, on the whole, society progresses, nor that in many respects the position of the wage earner to-day is in advance of his position at any former time in the world's history; but they do deny that his position is what the writers above quoted seem to imply, and they do deny that the wage earner, generally speaking, has had anything like his fair share of the world's progress. Some of them even maintain that in many important respects he is worse off than his fathers, and that his cause of complaint against the present industrial system is based upon the most careful estimates of economic facts. Those who hold this view make one or both of two points. They show, in the first place, that wages to-day are not rising; and, secondly, that in the long run, even if his wages have risen, the economic status of the laborer is not by any means in all respects to-day as favorable as formerly.

The belief that American wages have steadily risen in recent years is largely based on the Aldrich Senate Report of 1893. It is on this report that Mr. Wright bases his roseate statements. Now, this report is believed by many scholars to be utterly unreliable. Dr. Spahr, in his *Present Distribution of Wealth in the United States* (copyright by Thomas Y. Crowell & Co., New York and Boston), argues the utter worthlessness of its conclusions, and says (p. 103):

"The statisticians employed to summarize the returns were to a hurtful extent in sympathy with the political aim of the investigation. This criticism in no degree applies to Mr. Joseph D. Weeks, whose work is in the highest degree conscientious and intelligent. But Mr. Weeks's conclusions are not embodied in the committee's comprehensive summary for 'all' occupations. It is this summary that has spread so much misinformation throughout the country. Some of the more serious errors in the report are apparent upon a casual examination. When any one at all familiar with the course of wages in recent years takes up the report, he is astonished to see that the wages of clerks in stores have risen out of all proportion to wages in other industries. In the metal works, as he would expect, currency wages are reported to have fallen since 1873; so, too, in the cotton factories; but in stores, where the invasion of women and girls is believed to have depressed wages to an unusual extent, he finds it reported that an advance of nearly 40 per cent. has taken place. If, to understand the anomaly, he takes the trouble to consult the original data, he discovers that for the metal works and cotton factories the returns covered many establishments and many hundred employees, while for stores the returns covered but one dry-goods store and one grocery, employing together less than 30 clerks. Yet the committee, in its table of 'simple averages for all indus-

tries,' made the uninvestigated industry count as much as either of the thoroughly investigated ones. And the committee did not stop here. Despite this assumed rise of nearly 40 per cent. in the wages of clerks, the table of 'simple averages' still showed that currency wages had fallen 4 per cent. since 1873. Thereupon the committee proceeded to make a table of 'weighted averages,' assuming that the incredible advance of 40 per cent. in wages had been received by all the clerks in the country, and that since these outnumbered the employees in metal works and cotton mills put together, therefore the returns for less than 30 clerks ought to outweigh those for more than 1500 metal workers and more than 3000 cotton operatives. By this means currency wages in 1891 were made to rise one per cent. above the level in 1873.

A False Report.

"To cut short the criticism, in order to get at the facts reported, it is necessary to throw away the work done by the committee's experts, and return to the original reports made by the employers."

As we have seen above (Part II. of this article), accepting the returns of the report itself, Dr. Spahr shows that real wages, instead of rising since 1873, fell materially down to 1891, and in 1894 were 20 per cent. lower than in 1891.

The only industries in which wages rose between 1873 and 1891, according to the returns gathered by the report, were in the manufacture of ale, beer, and porter; the making of carriages and wagons; in the case of the clerks of the two dry-goods and grocery stores mentioned above; in the making of paper, of spice, and of woolens. Nor does Dr. Spahr begin to show the whole extent of the injustice by which the experts of this report twisted a fall of wages into a rise of wages. In the report itself the facts showing the fall of wages in the cotton and metal industries alone cover 686 pages, while the facts which the experts have magnified to overbalance the fall in wages cover only 11 pages. Yet it is on such a report that most writers, including Mr. Wright, have based their statements of the rise of wages.

As to the argument that while wages have risen, the cost of living to the workman has fallen, this statement is equally open to suspicion.

The Aldrich Report (p. 9) claims only a fall in the cost of living of some 4 per cent. since 1860. It compares the prices in 1860 and in 1891 of the various elements of the cost of living (in the proportion in which they enter into a working man's expenditure), and calling those of 1860 as 100, it finds that they stood in 1891 as follows: Rent, 100.0; food, 103.7; fuel, 98.1; lighting, 48.1; clothing, 75.1. All others, 95.3. Average, 96.2. Thus it

shows that the price of food has risen, but that, arguing that rents have remained stationary since 1860, the price of other commodities has fallen enough to make it 3.8 per cent. cheaper for a man to live in 1891 than in 1860. Now, who acquainted with city life believes that rents have not risen since 1860? Mr. Wright himself admits in his *Johnson's Cyclopaedia* article, that "rents are much higher." As for the other prices, the Report says they are based on the *wholesale* prices. Now, wholesale prices have notoriously fallen much more than retail prices. Unfortunately, the price of the workman's loaf, his fuel, his lighting, and to a less extent his other expenses, does not fall with the wholesale price of wheat, oil, and coal. The producers of

wheat, oil, and coal may get less to day, but the working class retail consumer by no means always benefits by the fall. Tables based on wholesale prices are utterly misleading so far as workmen are concerned. Yet it is only on such tables that a lower cost of living can be made out. And even with such calculations, it should be noted that the cost of food has risen, and that the things which are cheaper are clothing, light, and fuel. The decrease in fuel is reported as only 2 per cent. at wholesale. At retail it has probably not fallen. Clothing is 25 per cent. cheaper, but may be 25 per cent. less enduring. Lighting is 50 per cent. cheaper, but is only one item. The things which are of supreme necessity—rent, food, and fuel—have not fallen. For the poorest living is not cheaper. The better class of workmen who can spend for manufactured articles get them cheaper; this is all. In retail prices, the workman's wage does not go so far for the necessities of life as in 1860. Even since 1873 *retail* prices of *necessities* have not fallen as much as is generally supposed. Mr. Atkinson's and Mr. Wright's statistics as to wages are based on official reports shown to be false, and as to prices shown to be misleading.

As for the second point, admitting that wages are higher to day than early in the century, which no informed scholar denies, it does not follow that the laborer's real economic status is improved. Early in the century life was simple, wages were low, hours were long. But the workman who was faithful had a practical security of work. He often lived in a little home of his own whose garden could supplement his low wage. To-day his wage is all, and he has no security of work. The problem of the unemployed is the pressing problem of the present situation. If hours were long early in the century, the worker working at his little cobbler's bench or in a little shop, where some one could read aloud, had much more real opportunity to develop his own individuality than to-day, the working at shorter hours, in crowded factories amid machinery driven at its utmost speed. In real freedom and economic status, more than wages, therefore, must be taken into consideration before we can admit advance. As for comparison with a remoter past, Mr. Rae, as quoted above, argues that the working man is vastly better off to-day than "200 years ago, in the good old times socialist writers like to sing of," but no socialist writer sings of 200 years ago. By exactly picking his dates, Mr. Rae seems to prove progress for the working classes. Hale and King, whom Mr. Rae quotes, wrote in the last part of the seventeenth century. Two hundred years before that and 50 years after that Mr. Rae would have found a very different state of things. In the fifteenth century, before the English laborer had been driven off from the land, and was still under a form of feudal tenure, and yet no longer a serf, he was in what Mr. J. E. Thorold Rogers has called the "golden age of England." In the first part of the eighteenth century, when there was a revival of handicraft and machinery was not developed and monopolized, wages were higher than they were either immediately before or immediately after. It is to these times rather than to the seventeenth century that

socialist writers are apt to revert. And for the view that compared with these periods the present condition of the wage earner is not so favorable, they have good authority. As for Great Britain, comparing conditions in 1837 and 1897, Sydney Webb says in *Labor in the Longest Reign*:

"If we might sum up in one general impression the different facts as to comparative wages, we should, I think, have to come to this conclusion: While the skilled male craftsman has largely increased his income, and a practically new class of responsible and fairly well-paid laborers and machine-minders has come into existence, there exists now a greater sum, tho a smaller proportion of hopeless destitution than at any previous time. It appears, at any rate, highly probable that in 1897 there are positively more people in Great Britain who are existing at or near starvation wages than there were in 1837, altho their number bears a smaller proportion to the whole.

"Mr. Charles Booth tells us, in the effective 'eloquence unadorned' of his columns of statistics, that some 32 per cent. of the whole four millions of London's population fall within his four classes of 'poverty,' earning not more than a guinea per week per family. It is difficult to believe that, even in 1837, the percentage of persons at a corresponding low level can have been greater. It is practically certain, remembering the great increase in the total population, that at no previous time were the actual numbers more than at present. It has been reserved for our own prosperous time to produce the spectacle of over a million of people within one city living 'in poverty.' And when we examine closer into Mr. Booth's appalling details, and begin to realize that out of this huge residuum nearly a third are actually below what can be called even full subsistence for a London family, we shall begin to feel that our boasted progress since 1837 has not, after all, taken us very far. The 300,000 Londoners who fail to get even 18s. a week per family, and live in 'chronic want,' can never have been poorer. Their actual number in the much smaller city of 1837 cannot have been so great. And if we take into account the slums of our other great cities, and realize that we have in our midst a class of at least a million persons, besides the million at any one time in receipt of poor law relief, who live in 'chronic want' of even the necessaries of life, we shall begin to understand how very partial, after all, has been our progress.

"It is often assumed that this huge residuum which is existing in our midst at starvation wages is made up entirely of unskilled laborers, women plying the needle, and drunkards and wastrels of all kinds. But this is not the case. The unskilled laborer, indeed, is morally entitled to full subsistence, tho he does not always get it; but even men with a trade are sometimes little better off. We find to-day numerous small classes of skilled craftsmen in large towns whose weekly earnings do not amount to a pound a week. The Sheffield fork-grinders, for instance, working at a horribly unhealthy and laborious trade, are constantly found working at time-work for 16s. to 20s. for a full week of fifty-six hours, subject to considerable reductions for lost time. Similarly the Sheffield table-blade grinders, who do the common work, do not get more than a guinea a week net when working full time. Even in the comparatively prosperous textile industries there are large classes of men working as weavers, card-room operatives, etc., who do not make a pound a week."

Professor Rogers is not blindfold to the conditions of the past, yet in a carefully balanced paragraph he says (*Six Centuries of Work and Wages*, chap. vi.):

"The life of our ancestors, tho laborious, was not without its hopes. All the necessaries of life in ordinary years, when there was no dearth, were abundant and cheap, and even in dear years, the margin of wages or profits over the bare wants of life was considerable enough to fill up the void, even tho the laborer had to subsist for a time on some cheaper food than wheaten bread. Meat was plentiful; poultry found everywhere; eggs cheapest of all. The poorest and meanest man had no absolute and insurmountable impediment put on his career, if he would seize his opportunity and make use of it.

"I am well aware that in many particulars he was far behind his descendants in the conveniences and comforts of life. His diet, as I have allowed, was coarse

tho plentiful, and during a great part of the year was unwholesome. It took three centuries before the Dutch, who were for a long time the center of economic civilization, were able to discover and adopt those succulent and wholesome roots which have given health to man by banishing the loathsome diseases of the middle ages, and have rendered it possible to improve the breeds of cattle. I am well aware that such medical skill is now at the service of the poorest as princes and prelates desired, but were entirely without in the middle ages. I am quite familiar, as we all are, with the victories which human ingenuity has acquired over nature. . . .

I know that four grains of wheat and barley or any other grain are produced by modern tillage when one was with difficulty raised before; that the modern ox has been selected, bred, and fed from 400 pounds or less to 1200 pounds or more; that sheep, which once yielded a pound of wool precariously, now produce seven or nine pounds; that the powerful cart horse has taken the place of the wretched and stunted pony of the old English breed. . . . I know that many of our fellow-countrymen have exchanged squalid habitations and uncleanly practices for houses built by the newest lights of sanitary science and for fastidious cleanliness. I am alive to the fact that what were once the luxuries of the very few have now become the habitual comforts of the many, and that enterprise has scoured the earth to make these and newer luxuries abundant and cheap. I know that owing to the spread of knowledge, the adaptation of industry, the energy of invention, and the extension of trade, the population of England and Wales is tenfold what it was six centuries ago, that trim gardens, magnificent mansions, noble parks, rows of banks and houses, vast and splendid cities, occupy sites which were covered by squalid hovels or frequented by wild boars, curlews and bitterns, or were marsh fens and wild moors. I can see, without being reminded, that the most lofty and subtle, those of literature, are now common and profuse, and that the world of civilization is so strong that there seems no possible danger of its becoming destroyed by a new incursion of barbarians, not even of those barbarians whom it creates. The inhabitants of this country, at least those whom the historian and politician think worth instructing and consulting, enjoy the refined pleasure of criticising and, as many of them believe, conducting in no small degree the affairs of their own country and even of other peoples. . . .

I do not need to be told that the wealth of London is such, that a single block of buildings pays a higher rent to its fortunate owner than was derived from the whole customs of the port in the days of the Plantagenets and Tudors, that in a few hours a loan could be raised in London sufficient to equip and provision an army more numerous than all the men at arms were in medieval Europe, and this probably without deranging the course of trade or materially interfering with the functions of credit. And I suspect that when we are invited to consider all these things and more of the same nature, as the prodigious strength of modern governments, the boundless resources of modern societies, the priceless collections of art and letters, the ceaseless activities of enterprise and the ever-increasing discrepancies of science, it is fancied that a complete answer is given to those who entertain misgivings because they believe there is a reverse to the picture, another side to the shield, which these triumphant eulogies on modern progress would have us conceal or forget. . . .

It may be that the progress of some has been more than counterbalanced by the distresses and sorrows of many, that the opulence and strength of modern times mock the poverty and misery which are bound up with and surround them. . . . It may be well the case, and there is every reason to fear it is the case, that there is collected a population in our great towns which equals in amount the whole of those who lived in England and Wales six centuries ago, but whose condition is more destitute, whose homes are more squalid, whose means are more uncertain, whose prospects are more hopeless than those of the poorest serfs of the middle ages and the meanest drudges of the medieval cities."

In another passage (*idem*, chap. xix.) he thus sums up the economic history of the English laborer in the following words:

"I have shown that from the earliest recorded annals, through nearly three centuries the condition of the English laborer was that of plenty and hope; that

Progress.

Reverse Picture.

from perfectly intelligible cause it sunk within a century to so low a level as to make the workmen practically helpless, and that the lowest point was reached just about the outbreak of the great war between King and Parliament. From this time it gradually improved, till in the first half of the eighteenth century, it still far below the level of the fifteenth, it achieved comparative plenty. Then it began to sink again, and the workman experienced the direst misery during the great continental war. Latterly, almost within our own memory and knowledge, it has experienced a slow and partial improvement, the causes of which are to be found in the liberation of industry from protective laws, in the adoption of certain principles which restrained employment in some directions, and most of all in the concession to laborers of the right so long denied of forming labor partnership."

Some still more pointed passages from Mr. Rogers's work are as follows :

"I am convinced that at no period of English history for which authentic records exist was the condition of manual labor worse than it was in the 40 years from 1782 to 1824, the period in which manufacturers and merchants accumulated fortune rapidly, and in which the rent of agricultural labor was doubled" (chap. ii.). "I have stated more than once that the fifteenth century and the first quarter of the sixteenth were the golden age of the English laborer, if we are to interpret the wages which he earned by the cost of the necessaries of life" (chap. xii.). "The mass of English workmen are far better off now than they were 10 generations ago; the population has greatly increased. But relatively speaking, the working man is not so well off as he was in the fifteenth century, when the population was not one tenth of what it is now" (chap. xii.). "I contend that from 1563 to 1824 a conspiracy, concocted by the

Conspiracy.

law, and carried out by parties interested in its success, was entered into to cheat the English workman of his wages, to tie him to the soil, to deprive him of hope, and to degrade him into irremediable poverty" (chap. xiv.). "We have been able to trace the process by which the condition of English labor had been continuously deteriorated by the acts of government. It was first impoverished by the issue of base money. Next it was robbed of its guild capital by the land thieves of Edward's regency. It was next brought in contact with a new and more needy set of employers, the sheep masters, who succeeded the monks. It was then with a pretense, and perhaps with the intention of kindness, subjected to the quarter sessions amendment, mercilessly used in the first half of the seventeenth century, the agricultural laborer being still further impoverished by being made the residuum of all labor. The agricultural laborer was then further mulcted by inclosures, and the extinction of those memorial rights of pasture and fuel which he had enjoyed so long. The poor law professed to find him work, but was so administered that the reduction of his wages to a bare subsistence became an easy process and an economical expedient" (chap. xvii.). "Some of the working classes in London, and those who have been long educated in the machinery of labor partnership, have at last regained the relative rate of wages which they earned in the fifteenth century, tho perhaps in some particulars the recovery is not complete" (chap. xix.). "I make no doubt the ordinary hardships of human life in England were greater and, I am sure, they were more general six centuries ago than they are now. Life was briefer, old age came earlier, disease was more deadly, the risks of existence were more numerous. But the extremes of wealth and poverty were by the fact of these common conditions less widely separated. Above all things,

Grinding Poverty.

what is now characteristic of human life, that one half of the world does not know how the other half lives, a very moderate statement of the fact, was not true of the early ages of English progress. . . . The grinding, hopeless poverty under which existence may be just continued, but when nothing is won beyond bare existence did not, I am convinced, characterize or even belong to medieval life. That men died from want I can believe, but I do not think that they lived and died by inches, so to speak. There were many means by which occasional distress was relieved" (chap. xv.). "I do not imagine that the present privileges and allowances of laborers in husbandry are to be reckoned as spontaneous acts of generosity on the part of employers, in whom I have never seen any such tendency, but simply as the curtailed and by no means equivalent sur-

vivals of much larger and more solid advantages, which could not, perhaps, with safety be suddenly and entirely extinguished. It is probable, too, that the wages of labor were far more continuous in agricultural operations than they are now. . . . The wages of ordinary agricultural labor earned by women are not more than a third of the amount which they were four centuries ago" (chap. xix.).

After all these quotations it is impossible to deny that there is some ground for the socialist question, whether the laborer is better off today than of old. It is true that it is fashionable in certain quarters to question Mr. Rogers' authority; but, in the first place, Mr. Rogers' assertions are based on the study of thousands of accounts as to prices actually paid and wages actually received, preserved in the musty archives of English libraries and written without the slightest thought of what use they would be put to. Mr. Rogers, too, commenced his study of them with views contrary to those that later study compelled him to adopt. Secondly, Mr. Rogers is not alone in this view. Mr. Newmarch, in his *History of Prices*, comes to substantially the same conclusions, and most of them can be supported from Hallam's and other histories of the Middle Ages. (See also WEALTH; WOMAN'S WAGES.)

WAGES OF SUPERINTENDENCE.—

It is often forgotten that the employers of labor usually, tho not always, do important work themselves. They furnish to an industry the most important work of superintendence, of planning the work, of obtaining the raw material, of providing the plant and machinery—in a word, of managing the business. This work is almost always of the extremest importance. Especially under sharp competition, management is sometimes nine tenths of the element of success. It demands usually large and varied talents, concentration of thought, attention to small details, and yet ability to run the business as a whole. It demands long hours and continuous responsibility. The employee who works even long hours, when his hours are over is free. The employer is often never free. He sometimes works all day and worries all night. His work, therefore, is often long and exacting, as well as of the utmost importance. He is, as such, a skilled wage-worker, and what he earns as such (not as a mere capitalist, but as performing the work of superintendence) is money earned by hard labor, and may be, as it is often, called the wages of superintendence. It is often high wages, but even so is often wholly earned. Socialists do not object to wages of superintendence. They recognize the importance of superintendence and its value in production, only they would have it performed for the community and not for private stockholders. The very same men, they say, who do such work to-day for private firms could do it under socialism for the people, as, indeed, does occur when a railroad goes into the hands of a receiver.

WAGNER, ADOLF HENRI GOTTHILF, was born at Erlangen in 1835. Studying at the University of Heidelberg, he became in 1858 professor in the Commercial College of Vienna, and then at Hamburg, Dorpat, Freiburg, and since 1870 at Berlin. He is prominent as a leader in the historical school of Germany, and particularly as a Socialist of the Chair (*q.v.*), and a sympathizer with German Christian Socialism (*q.v.*). He is best known for his studies in finance and his general economic treatise. Among his works are: *Die Geld und Kredit theorie der Peelschen Bankacte* (1862); *System der deutschen Zettelbank-Gesetzgebung* (1873); *Lehrbuch der polit. Oekonomie* (1872). (See **POLITICAL ECONOMY**.)

WALKER, AMASA, was born in Woodstock, Conn., in 1799. Educated in public schools, he became a merchant in Boston in 1825, and gained prominence in the construction of the early railroads, and also in the anti-slavery and temperance reforms. He was Professor of Political Economy in Oberlin College, Oberlin, O., 1842-49; in the Massachusetts Legislature, as a member of the House in 1848, and of the Senate in 1849; Secretary of State, 1851-52. He was in Congress 1862-63, and Lecturer on Political Economy at Amherst College, 1861-66. He died at North Brookfield in 1875. His most important work was *The Science of Wealth* (1866).

WALKER, FRANCIS AMASA, son of Amasa Walker (*q.v.*), was born in Boston, in 1840, and graduated at Amherst College in 1860. He studied law at Worcester, but entered the army in 1861 as sergeant-major. He was constantly promoted, and became brevet brigadier-general in 1865. He was wounded at Chancellorsville, was captured at Ream's Station, and confined at Libby Prison, where his health became shattered. After the war he was teacher at Williston Seminary, 1865-68; editor of the *Springfield Republican*, 1868-69; chief of the Bureau of Statistics of the Treasury Department at Washington, 1869; Superintendent of the ninth United States Census, 1870; Commissioner of Indian Affairs, 1871-72; Professor of Political Economy and History in the Sheffield Scientific School of Yale College, 1872; Superintendent of the tenth United States Census, 1880; and President of the Massachusetts Institute of Technology in Boston, 1881, which position he held till his death in 1896. His main writings have been *The Wages Question* (1876); *Money* (1878); *Political Economy* (1883); *Land and its Rent* (1883); *The Making of a Nation* (1895); *International Bimetallism* (1896). He is best known in economics as the main originator of the theory that wages depend upon production, for his Ricardian views of rent, and his advocacy of international bimetallism. He is considered by many, like Dr. Ingram (see **POLITICAL ECONOMY**), as among the ablest of American economists.

WALKING DELEGATE, THE, is the paid secretary of a trade-union. His duties usually are to pay out the sick and out-of-work benefits of the union; to see that they are only

paid to those really entitled to them; to visit the sick members; to care for the burial of members who have died; to try and secure work for members out of work (thus often having an office and acting as an employment bureau); to investigate troubles between members and employers; to try and secure redress from the employers if the case is found to need it; to report to the union if the employer will not grant redress—to advise the union whether or not it is advisable to strike; if the union votes to strike, to give the signal to the members when to strike and to take charge of the strike.

It is this last duty which has made the name of the walking delegate so unpopular with employers. They see him give the signal to strike; at his signal they see their men lay down their work; the walking delegate visits the employer to represent the men; the employer not unnaturally thinks that the walking delegate, who appears to be, and often is, the leader of the union; is the person who has stirred up the evil, and that at his *order* his men have struck. He therefore thinks that his men are under the tyranny or at least the influence of this "paid agitator," and lays at his door most of the evil of the strike.

As a matter of fact, in no trade-union is a walking delegate ever allowed to order a strike. He is always the servant of the union, usually poorly paid, and can only give a signal when the union has voted to strike—never an order. English and American trade-unionists are singularly democratic and jealous of authority. They never put themselves under a walking delegate.

Employers too often resent dealing with their men through a walking delegate; they say that they wish to deal with their men directly. They forget that any body of men has unquestioned right to deal through a representative. Corporations continually do so. Trade-unions do so because they have learned that an employee dependent upon an employer cannot face the employer as can a walking delegate who is independent of the employer. Hence the need and justice of employing a walking delegate to conduct such negotiations. The walking delegate's main duty, however, is to care for the sick and out-of-work. Strikes come but rarely; the sick and needy are always present.

Dr. Rainsford, of New York City, says concerning walking delegates:

"I believe the labor leaders in the United States, taking them all in all, are just as good as the leaders in law or finance or society or politics. . . . I know a man who for years in this country has occupied one of the first positions as a labor leader. No word is too bad to be said about him by most of the press and some of the colleges; and I know, as a matter of fact, that the man, with a large family of children, never drew but one half his salary during the whole time he held office, and put the other half back into the treasury of his organization. I know a man who, if my judgment amounts to anything, is one of the ablest men in the United States—a man who has great powers of tongue and great powers of organization, and a true, whole-souled man, and altho, alas! he is outside the Christian Church, I venture to say, a large, whole-souled Christian, too. That man is at the head of an enormous federation in this country, and has never taken but two dollars and fifty cents a day, which is due to him from his trade, and he has never taken even his two dollars and fifty cents a day except when he was engaged in the active business of his federation; and when he has not been engaged in their

business he has worked at his trade like anybody else. And I will tell you that this winter, with an old mother to support, that man walked the streets in the cold for three long weeks to get work (and there is no better workman at his trade), because boss after boss said 'Mr. So and So, you are upholding labor unionism, and we won't give you work.' That man walked for three weeks before he could get a job for two dollars and a half a day, rather than give in and surrender his principles. I say that if our Lord and King were back on the earth, I believe from my soul that those men would be in His train."

WALLACE, ALFRED RUSSEL, was born at Usk, in Monmouthshire, in 1822. In 1848 he visited the Amazon River, and in 1854-62 the Malaysian Islands. He corresponded with Darwin as early as 1858, stating principles of natural selection. His first book on *Evolution* was published in 1870. He has since written other books, and *Darwinism* in 1889. He early became interested in social questions, and in 1882 published his able and radical book on *Land Nationalization*. He has recently avowed himself a full socialist.

WALLACE, J. BRUCE, was born in India, in 1853, his father being a missionary there of the Presbyterian Church. He was educated in Europe and at Queen's University, Ireland, entering the Congregational ministry in 1878. In 1885 he renounced the regular ministry to devote himself to Christian Socialism, and in 1887 began to publish a paper, *Brotherhood*, in Ireland. In 1891 he settled in London, and published *Brotherhood* there. In 1892 he became pastor of the South Road Church (now "The Brotherhood Church"). In January, 1894, with others, he organized "The Brotherhood Trust" (*q.v.*).

WAR.—(See ARMY AND NAVY; INTERNATIONAL ARBITRATION, for their respective subjects.) We give here some statistics of the size of armies and the cost and destructiveness of wars. Ancient armies were not usually so large, costly or destructive as modern armies, though probably far more destruction of life took place in ancient days as the result of war than in modern days, because warfare was far more constant, and because the very cost and destructiveness of modern methods and engines of war have made the wars more difficult to commence or sustain. Reliable statistics of the size of ancient armies do not exist.

According to Herodotus, the army of Sesostris consisted of 200,000 infantry, 24,000 cavalry, 2700 war chariots. This is probably, however, an exaggeration. At Platæa the Persians are said to have brought into the field 300,000 men, besides 100,000 at Mycale the same day. The victorious Greeks were of course comparatively but a handful. Darius had, according to Quirites, 600,000 infantry, but this is almost certainly a gross exaggeration. Alexander at Arbela is said to have had 60,000 fighting men. Hannibal, in warring with Rome, had 100,000 men, counting all Carthaginian forces in Africa, Spain and Italy. Rome in the second Punic war had 100,000 men. Under the empire, the Roman legions were vastly multiplied, but scattered over the empire, from Britain to Syria, and from Spain to the Danube. The armies in one war were not usually very large.

The Middle Ages saw constant battling rather than large armies. The army of Napoleon at the time of the Russian campaign was one of the largest of the world, counting in all 1,200,000 men, tho of these only 850,000 were actually in the field.

Of the cost and destructiveness of wars in the

present century, Mulhall's *Dictionary of Statistics* (1892) gives the following figures :

	Cost in Millions of Dollars.	Loss of Life.
England and France, 1793-1815.....	\$6,250	1,900,000
England, France and Russia, 1854-56.....	1,525	485,000
United States (Civil), 1863-65.....	3,700	656,000
France and Germany, 1870-71.....	1,580	290,000
Russia and Turkey, 1876-77.....	950	180,000

The cost in millions of dollars and loss *per year* in these wars were :

	Cost in Millions of Dollars.	Loss of Life.
England and France.....	\$272	82,635
England, France and Russia.....	508	161,667
United States (Civil).....	1,233	218,666
France and Germany.....	790	145,000
Russia and Turkey.....	475	90,000

According to these figures, the Civil War of the Rebellion was *per year* the costliest and most destructive war of modern times, and probably of all times. In absolute cost and destructiveness it was only exceeded by the wars between England and France, which lasted 22 years.

The War of the Revolution is said to have cost about \$135,000,000. About 300,000 American troops were engaged at various times during the war, of which 130,000 were regulars. When Washington took command he had 14,500 men, and estimated the British at 11,000, which was soon increased, however, to 25,000. Later, General Burgoyne led 8000 from Canada and 1000 Indians. The British forces were largely Hessian mercenaries, for which the German princes were paid some \$850 per head; 7000 French aided the Americans. In the War of 1812, the United States had in all branches of the service 576,622 men; in the war with Mexico, 112,230.

In the Civil War, the Northern troops engaged at any time in the war numbered 2,772,408. The Confederate troops are estimated at a total of 600,000 or 700,000. The Northern loss by deaths in field, hospital, or elsewhere was 349,944, or about 13 per cent. The Confederate total loss by death was about 350,000, or some 50 per cent. At Gettysburg (3 days) the Northern troops killed were 3070; the killed, wounded and missing were 23,000. At Spottsylvania (11 days) the corresponding numbers were 2725 and 18,395; at the Wilderness (3 days), 2246 and 17,666; at Antietam (1 day), 2108 and 12,410. Gettysburg was thus the greatest battle and Antietam the bloodiest. The Confederate troops lost at the Seven Days' Battle in Virginia 3478, and killed, wounded, captured, or missing, 20,614. At Antietam (in 9 days) the corresponding figures were 1886 and 12,601; at Gettysburg, 2502 and 20,448; at Chickamauga, 2268 and 116,971. The United States Ordnance Department served out during the war 7892 cannon, 4,022,000 rifles, 12,000 tons of powder, and 1,022,000,000 cartridges. If all the Confederate loss was due to cartridges, only 1 cartridge in about 3000 killed. In the Crimean War according to Mulhall, 97,860 British, 309,490 French, and 165,000 Turks took the field against 888,000 Russians. The British lost 22,182, or 22½ per cent.; the French, 95,615, or 31 per cent.; the Turks, 45,400, or 27 per cent.; the Russians, 446,600, or 50 per cent. In the Franco-German War, 710,000 French took the field, and lost 138,770, or some 20 per cent.; 1,003,000 Germans fought and lost 447,751, or little over 4 per cent.

United States Wars.

Other Wars.

WARD, LESTER FRANK, was born at Joliet, Ill., in 1841. He attended various schools, served in the Civil War, graduated at Columbian University in Washington in 1869. He has been chief of the navigation division and librarian of the United States Bureau of Statistics; chief of paleobotany for the United States Geological Survey, and honorary curator of fossil plants in the national museum. His scientific papers number over 400. His two works on sociology, *Dynamic Sociology* (1883) and *The Psychic Factors of Civilization* (1893) are among the most learned contributions to that science. (See SOCIOLOGY.)

WARREN, JOSIAH, was born near Boston, in 1799. Of unusually thoughtful disposition, tho without great advantages, when Robert Owen founded the community of New Harmony (*q.v.*) Warren became interested and joined it. Its failure set him to thinking. He came to the conclusion that in the community the individual had been made too little of, and that the need was not more socialism, but more individualization. He concluded, secondly, that cost was the true basis of price. (See VALUE.)

This was about 1827. Warren then determined to test the cost theory, and he started a store in Cincinnati, which he conducted for two years, doing business to the amount of \$150,000. For the details, see Warren's *Practical Details of Equitable Commerce* (now out of print). Business was not centralized as now, and the retailer realized large profits. Warren marked his goods with the cost and added 7 per cent. for rent, fuel, etc., exclusive of the labor of himself and the employees. This 7 per cent. was carefully computed, and was invariable, but it allowed no profit. A clock was kept in the store, and every customer was timed and charged so much an hour for the time of the salesman. The charge for time was reduced with the increase of business. Finally Warren issued his own money in the shape of labor notes, which he exchanged for the labor notes of his customers. His notes became a popular circulating medium.

The experiment satisfied him, and he closed his store, and later published his principal work, *True Civilization* (1846). Warren set the type for it himself.

Warren next went to Ohio and started a community based on his ideas. He converted Stephen Pearl Andrews (*q.v.*). Later he founded Modern Times, a community on Long Island, but neither community prospered. He then lived a sort of hermit life, partly in Princeton, Mass., and died at Charlestown in 1874. He is considered by the philosophical anarchists, as with Proudhon, the founder of their system of thought. (See ANARCHISM.)

WASHINGTONIAN MOVEMENT.—This celebrated moral suasion crusade had its origin in the reformation of a Baltimore drinking club of six men—W. K. Mitchell, a tailor; J. F. Hoss, a carpenter; David Anderson and George Steers, blacksmiths; James McCurley, a coachmaker, and Archibald Campbell, a silversmith. They were induced to change their habits by the address of a temperance lecturer,

and signed the following pledge (April 6, 1840): "We, whose names are annexed, desirous of forming a society for our mutual benefit, and to guard against a practice—a pernicious practice—which is injurious to our health, standing, and families, do pledge ourselves, as gentlemen, that we will not drink any spirits or malt liquors, wine, or cider."

They took the name of "The Washington Temperance Society," and were familiarly known as "Washingtonians." By the end of 1840 this Baltimore organization had 700 members; and under the leadership of John H. W. Hawkins, the most prominent Washingtonian agitator, the crusade spread to other cities and States. Its force was spent by 1843, but the energy developed by it was of great and lasting benefit to the general temperance cause.

WATERED STOCK. See STOCK WATERING.

WATER-WORKS, MUNICIPAL, are almost the only instance in which the United States is in advance of Europe in adopting the principle of public ownership. The first water-works in the United States were built at Boston in 1652 by the Water-Works Company. The second were built at Bethlehem, Pa., in 1761. By 1800 there were 16, only one being owned by the public. In 1890, of the 1878 works in the United States, 806, or 43 per cent., were owned by cities.

The average rates charged private consumers by 430 companies, as shown by the *Manual of American Water-Works* for 1889-90, were 43 per cent. higher than those charged by 318 cities for the same service. Many of these water-works are very profitable.

For New York City, Mayor Strong, in his message concerning the Department of Public Works (1897), makes the following report from the Bureau of Water-Register:

"For the first time in the history of the city the revenue collected last year from water rents was more than enough to reimburse the city for the entire outlay of the Department of Public Works, which is taken from taxation. To express it in another way, our water rents paid for road pavements, street lighting, care of and repairs to the entire water system, care of and repairs to public buildings, salaries, wages, and all other administrative expenses."

The report of the Water Department of Chicago for 1897 shows that the receipts were \$3,226,000 and the operating expenses, \$285,000, leaving net earnings of \$2,941,000. The investment in the Chicago Water-Works, according to the New York *Sun*, was \$28,000,000, so that, besides interest on bonds for this amount, the net profits are \$1,500,000. The public also receives free water in its parks, streets, and public buildings. (For water-works in Europe, see articles BERLIN; BIRMINGHAM; GLASGOW; LONDON; PARIS.)

WAYLAND, FRANCIS, was born in New York in 1796, and graduated at Union College in 1813. He studied medicine, but later entered the Baptist ministry. He was tutor at Union College, 1817-21; pastor of the First Baptist

Church in Boston, 1821-26; President of Brown University, 1827. He died in 1865. His sociological writings are: *Elements of Moral Science* (1835); *Elements of Political Economy* (1837).

WEALTH.—We consider this subject under four heads: I. Definitions; II. Statistics of Wealth; III. The Concentration of Wealth; IV. Is the Concentration of Wealth Increasing or Decreasing?

I. DEFINITIONS.

Wealth is usually defined in economic science as "useful or agreeable things which possess exchangeable value" (Mill). Of this definition Mill says (*Political Economy*, "Preliminary Remarks"):

"Things for which nothing could be obtained in exchange, however useful or necessary they may be, are not wealth in the sense in which the term is used in political economy. Air, for example, tho the most absolute of necessaries, bears no price in the market, because it can be obtained gratuitously; to accumulate a stock of it would yield no profit or advantage to any one; and the laws of its production and distribution are the subject of a very different study from political economy. But tho air is not wealth, mankind are much richer by obtaining it gratis, since the time and labor which would otherwise be required for supplying the most pressing of all wants can be devoted to other purposes. It is possible to imagine circumstances in which air would be a part of wealth."

Senior's definition of wealth, quoted by Jevons (*Theory of Political Economy*, p. 175), is the same, that wealth consists of "those things and those things only which are transferable, are limited in supply, and are directly or indirectly productive of pleasure or preventive of pain."

On the other hand, many reform writers identify wealth with well-being on the ground that it is impossible to divorce immaterial factors from material factors, and still be true to the facts of life. John Ruskin, *e.g.*, argues that no article is useful except to those who can use it. Hence he says:

"Wealth, therefore, is 'the possession of the valuable by the valiant'; and in considering it as a power

existing in a nation, the two elements, the value of the thing and the valor of its possessor, must be estimated together. Whence it appears that many of the persons commonly considered wealthy are in reality no more wealthy than the locks of their own strong boxes are, they being inherently and eternally incapable of wealth, and operating for the nation, in an economical point of view, either as pools of dead water and eddies in a stream (which, so long as the stream flows, are useless, or serve only to drown people, but may become of importance in a state of stagnation, should the stream dry); or else as dams in a river, of which the ultimate service depends not on the dam, but the miller; or else as mere accidental stays and impediments, acting not as wealth, but (for we ought to have a corresponding term) as 'illth,' causing various devastation and trouble around them in all directions; or lastly, act not at all, but are merely animated conditions of delay (no use being possible of anything they have until they are dead), in which last condition they are nevertheless often useful *as* delays and 'impedimenta,' if a nation is apt to move too fast."

Some writers on reform distinguish between riches and wealth. Says G. Bernard Shaw in the *Fabian Essays*:

"It is sometimes said that during this grotesquely hideous march of civilization from bad to worse, wealth is increasing side by side with misery. Such a thing is eternally impossible; wealth is steadily decreasing with the spread of poverty. But riches are increasing, which is quite another thing. The total of the exchange values produced in the country annually is mounting perhaps by leaps and bounds. But the accumulation of riches, and consequently of an excessive purchasing power, in the hands of a class, soon satiates that class with socially useful wealth, and sets them offering a price for luxuries. The moment a price is to be had for a luxury, it acquires exchange value, and labor is employed to produce it. A New York lady, for instance, having a nature of exquisite sensibility, orders an elegant rosewood and silver coffin, upholstered in pink satin, for her dead dog. It is made; and meanwhile a live child is prowling barefooted and hunger-stunted in a frozen gutter outside. The exchange-value of the coffin is counted as part of the national wealth; but a nation which cannot afford food and clothing for its children cannot be allowed to pass as wealthy because it has provided a pretty coffin for a dead dog."

II. STATISTICS OF WEALTH.

The census valuation of real and personal property in the United States (Alaska excluded) in 1890 was as follows:

STATES AND TERRITORIES.	Total.	Real Estate with Improvements Thereon.	Live Stock on Farms, Farm Implements and Machinery.	Mines and Quarries, including Product on Hand.	Gold and Silver, Coin and Bullion.
The United States.....	\$65,037,091,197	\$39,544,544,333	\$2,703,015,040	\$1,291,291,579	\$1,158,774,948
North Atlantic Division.....	\$21,435,491,864	\$13,995,274,364	\$430,770,756	\$424,071,494	\$390,431,535
South Atlantic Division.....	5,132,980,666	2,923,418,932	108,075,819	61,415,252	140,731,530
North Central Division.....	25,255,915,549	15,125,481,180	1,447,471,577	220,544,444	387,040,555
South Central Division.....	6,401,281,019	3,538,805,433	499,372,600	40,915,904	170,393,078
Western Division.....	6,811,422,099	4,051,564,424	217,324,288	544,343,485	70,176,250

STATES AND TERRITORIES.	Total.	Machinery of Mills and Product on Hand, Raw and Manufactured	Railroads and Equipments, including Street Railroads.	Telegraphs, Telephones, Shipping, and Canals.	Miscellaneous.
The United States.....	\$65,037,091,197	\$3,058,593,441	\$8,685,407,323	\$791,755,712	\$7,893,708,821
North Atlantic Division.....	\$21,435,491,864	\$1,739,752,192	\$1,445,910,383	\$351,283,023	\$2,747,968,117
South Atlantic Division.....	5,132,980,666	180,991,025	943,510,336	76,132,083	608,705,689
North Central Division.....	25,255,915,549	873,977,334	3,937,237,117	160,425,950	3,103,737,392
South Central Division.....	6,401,281,019	138,558,243	1,288,746,449	53,994,196	760,494,116
Western Division.....	6,811,422,099	125,314,647	1,070,003,038	59,920,460	672,773,507

The following estimate of the nation's income on *The Present Distribution of Wealth of the United States* (1896):

NATIONAL INCOME, 1890.

INDUSTRY.	Number Engaged.	Method of Reckoning Income.	Wages.	Profits.	Total Income.
Agriculture	8,497,000	Includes \$140,000,000 house rent*	\$2,600,000,000
Mines	359,000	Wages at \$370 (official estimate for coal miners); profits, etc., 60 per cent. of wages, as in 1880†.	\$130,000,000	\$80,000,000	210,000,000
Manufactures and mechanical trades.....	5,091,000 (4,659,000 Wage Earners)	Wages, \$360; profits, etc., two thirds, as in Massachusetts‡.....	1,674,000,000	1,116,000,000	2,790,000,000
Railroads.....	462,000	Net profits official, wages, etc., same per cent. as in 1880.....	300,000,000	331,000,000	630,000,000
Others in trade or transportation.....	2,863,000	Net product the same per head, as in manufactures.	1,570,000,000
Teachers.....	342,000	Wages at \$250 (official estimate 1889, \$230 for public schools)§	86,000,000
Ministers	88,000	Salaries at \$900; official estimate for Methodist Church, North, \$843 + \$53 fees 	80,000,000
Physicians and lawyers.	195,000	Earnings one third more than ministers, or \$1,200¶.....	234,000,000
Other professions	320,000	Earnings at \$800	260,000,000
Servants and laborers..	3,357,000	Wages at \$200	670,000,000
All others.....	1,172,000	Earnings at \$400	470,000,000
Urban real estate (excluding stores and factories).....		Six and two thirds per cent. on estimated value**.....	1,200,000,000
	22,735,000				\$10,800,000,000

* In agriculture the cost of seed, fertilizers, etc., and the expenses for stock and implements, are offset by fuel and betterments.

† It is true that miners' wages are not net. (The Iowa Labor Report for 1890-1891 estimates the cost of powder, smithing, and oil at about one-fifth of nominal wages.) Nevertheless, the average wages of coal-miners are exceptionally low.

‡ In the building trades, wages are much higher than in manufactures, but profits are much less. The net product per hand is about the same.

§ Teachers' wages are often for a very few months' employment.

¶ Ministers' salaries in the Congregational Church average \$1047. Nevertheless, in the great denominations, especially those strong in the South and among the negroes, salaries are very much lower.

** Physicians' incomes are estimated somewhat higher than this by Dr. George F. Shrady (*Forum*, 1894), who makes \$1200 the average outside the cities. It seems probable, however, that Dr. Shrady had in mind only the East and North.

** From the value of non-agricultural real estate (\$26,000,000,000) must be subtracted about \$2,650,000,000 for factories and shops, as much more for stores, and a third sum of nearly equal magnitude for untaxed property—chiefly public. The total income from house and office rents, as estimated in the text, is one seventh of the total income of the non-agricultural population.

FOREIGN HOLDINGS OF AMERICAN WEALTH.

Respecting the foreign holdings of American wealth, the most careful estimate, perhaps, is that made by M. Georges Martin, and published in the *Journal of the Statistical Society of Paris*, April, 1891. It relates only to the securities quoted on European exchanges; but such securities represent the great body of American property held abroad. The estimate is briefly as follows:

222 SECURITIES QUOTED EXCLUSIVELY IN EUROPE.

Aggregate Value.	Europe's Share of Principal.	Europe's Share of Interest.
\$694,000,000	\$694,000,000	\$34,700,000

267 SECURITIES QUOTED ALSO IN AMERICA. STOCKS AND BONDS, INCLUDING STATE BONDS.

Aggregate Value.	Europe's Share of Principal.	Europe's Share of Interest.
\$3,238,000,000	\$1,079,000,000 (min.)	\$54,000,000
	to \$1,619,000,000 (max.)	to \$81,000,000

FEDERAL BONDS.

Aggregate Value.	Europe's Share of Principal.	Europe's Share of Interest.
\$735,000,000	\$73,500,000	\$3,000,000

AGGREGATE PRINCIPAL	AGGREGATE INTEREST.
From \$1,846,000,000	From \$91,700,000
To \$2,386,000,000	To \$118,700,000

THE MINIMUM DEBT OF THE UNITED STATES, 1890.

Estimate of Mr. George K. Holmes, the head of the Bureau of Mortgages (*Political Science Quarterly*, 1893):

Railroad companies (funded debt).....	\$4,631,473,184
Street railway companies (funded debt)..	151,872,289
Telephone companies (funded debt)....	4,992,565
Telegraph, public water, gas, electric lighting and power companies (estimated).....	200,000,000
Other quasi-public corporations (to make round total).....	11,661,962
Total debt of quasi-public corporations.....	\$5,000,000,000

Real estate mortgages (estimated).....	\$6,000,000,000
Crop liens in the South (estimated).....	350,000,000
Chattel mortgages (estimated).....	300,000,000
National banks (loans and overdrafts)....	1,986,058,320
Other banks (loans and overdrafts, not including real estate mortgages).....	1,172,918,415
Other private debts (to make round total)	1,191,023,265

United States.....	\$891,960,104
States.....	228,997,389
Counties.....	145,048,045
Municipalities.....	724,463,060
School districts.....	36,701,948

Total public debt (less sinking fund) \$2,027,170,546

Total debt of other private corporations and individuals.....\$11,000,000,000
Total private debt.....\$16,000,000,000

Grand total.....\$18,027,170,546

ESTIMATED WEALTH OF THE NATION—1825-97.

(In Millions of Dollars.)

Wealth from 1825 to 1870 estimated by the Director of the Mint, Report for 1881, p. 321; from 1870 to 1897, estimated by G. B. Waldron, in *Handbook of Currency and Wealth*, except for census years 1880 and 1890.

Year.	Wealth.	Year.	Wealth.	Year.	Wealth.	Year.	Wealth.	Year.	Wealth.
1825.....	3,273	1840.....	5,226	1855.....	11,488	1870.....	*26,460	1885.....	52,908
1826.....	3,377	1841.....	5,392	1856.....	12,396	1871.....	27,781	1886.....	55,138
1827.....	3,484	1842.....	5,593	1857.....	13,318	1872.....	29,164	1887.....	57,462
1828.....	3,594	1843.....	5,739	1858.....	14,252	1873.....	30,618	1888.....	59,883

* On a gold basis.

In an article in *The North American Review* for June, 1895, Mr. M. G. Mulhall, the English statistician, gathers the following results from the census figures of the United States from 1850-90:

"If we would classify the whole wealth of the Union under two heads, urban and rural, the result at different dates would be as follows:

URBAN AND RURAL WEALTH OF THE NATION.

YEARS.	MILLIONS OF DOLLARS.			PERCENTAGE OF TOTAL.	
	Urban.	Rural.	Total.	Urban.	Rural.
1850.....	3,169	3,967	7,136	44.4	55.6
1860.....	8,180	7,980	16,160	50.6	49.4
1870.....	15,155	8,900	24,055	63.0	37.0
1880.....	31,538	12,104	43,642	72.2	27.8
1890.....	49,055	15,982	65,037	75.4	24.6

"In the table rural wealth is the aggregate of the value of lands, cattle, and implements at each census; the rest is urban. We find that rural agricultural wealth has only quadrupled in 40 years, while urban has multiplied sixteenfold. This would seem to point to the conclusion that farming has not been so profitable as commerce, manufactures, banking, railways, and other pursuits. But it is to be observed that in late years the increase of urban population has been much greater than that of rural, and that the number of hands engaged in agriculture is by no means comparable with that of persons engaged in city or town life. The following table shows the increase of wealth per head in the two great classes that make up the American people.

"Before 1860 the accumulation of wealth for each rural worker was much greater than that corresponding to persons of the urban classes. Between 1860 and 1870 the farming interests, especially in the Southern States, suffered so severely by reason of the war that the increase per head fell below \$18 yearly; but during the last 20 years the increment of rural wealth has been almost uniform at \$47 per head per annum of the number of rural workers. Looking back to 1870, we find that since that year the accumulation of wealth among urban workers has averaged over \$82 per annum, or 73 per cent. more than among rural workers, which suffices to explain the influx of population into towns and cities."

ANNUAL ACCUMULATIONS BY URBAN AND RURAL WORKERS.

PERIODS.	NUMBER OF WORKERS.			YEARLY ACCUMULATION, MILLIONS OF DOLLARS.			PER WORKER, YEARLY.	
	Urban.	Rural.	Totals.	Urban.	Rural.	Totals.	Urban.	Totals.
1871-60.....	11,216,000	3,820,000	15,036,000	501	401	902	\$44.70	\$15.00
1861-70.....	14,462,000	5,133,000	19,595,000	698	92	790	48.30	17.90
1871-80.....	18,183,000	6,797,000	24,980,000	1,638	320	1,958	90.00	47.10
1881-90.....	23,905,000	8,215,000	32,120,000	1,752	388	2,140	73.30	47.30

Per Capita Wealth.

The total wealth of the United States as given by the census in round numbers is \$65,000,000,000, or about \$1000 per head, or, reckoning five to a family, \$5000 per family. The total income is reckoned by Dr. Spahr at \$10,800,000,000, or about \$421 for each person engaged in remunerative business, including men, women and children. For what men do earn, see article WAGES. Men's wages are usually above the average, if skilled, because women and unskilled laborers receive less.

GREAT BRITAIN.

The (English) *Fabian Tract*, No. 5, revised edition (1895), says :

"The annual income of the United Kingdom was estimated by the following authorities at from twelve to thirteen hundred million pounds sterling; or, the population in 1881 being nearly 35,000,000, about £35 per head, or £140 per adult man.* In 1840 it was about £20½, and in 1860, £26½ per head (Mr. Mulhall, *Dictionary of Statistics*, p. 245; Sir Louis Mallet, K.C.S.I. (India Office), 1883-84, *National Income and Taxation* (Cobden Club), p. 23, £1,280,000,000; Professor Leone Levi (King's College, London), *Times*, January 13, 1885, £1,274,000,000; Mr. R. Giffen (Board of Trade), *Essays in Finance*, vol. ii., pp. 460, 472 (1886), £1,270,000,000; Mr. Mulhall, 1892, *Dictionary of Statistics*, p. 320, income for 1889, £1,285,000,000; Professor A. Marshall (Cambridge University), *Report of Industrial Remuneration Conference*, p. 194 (January, 1885), upward of £1,125,000,000.

"Since these estimates were made the gross assessments to income tax have risen (1882-83 to 1892-93) by £99,345,041 (*Statistical Abstract*, C-7143, and *Inland Revenue Report*, 1892-94, C-7557). Allowing for a corresponding rise in the incomes not assessed and in the wages of manual labor, we may estimate the income for 1893-94 at not less than £1,450,000,000. The population has risen from 34,884,848 in 1881 to 37,731,915 in 1891.

"These figures (which are mainly computed from income-tax returns and estimated average rates of wages) mean that the price in money of the commodities and services produced in the country during the whole course of a year was about £152 per adult man.† Most of these commodities and services were used up within that period in maintaining the 37,000,000 inhabitants, and Mr. Giffen estimates that about £200,000,000 is 'saved' annually (*Essays in Finance*, vol. ii., p. 107). The bulk of this 'saving' exists in the form of new railways, houses, roads, machinery, and other aids to future labor. . . .

(a) Rent.

"The total 'gross annual value' of lands, houses, tithes, etc., as assessed for income tax in 1892-93, was £202,710,218; the rents of mines, quarries, ironworks, gasworks, waterworks, canals, fishings, shootings, markets, tolls, etc., amounted to £28,576,080 (*Inland Revenue Report*, 1893-94, C-7557). Many of these are far from being fully assessed, and the total 'rent' of the United Kingdom must, therefore, exceed two hundred and thirty millions sterling, or nearly one sixth of the total produce.

(b) Interest.

"The profits of public companies, foreign investments, railways, etc., assessed to income tax in the United Kingdom in 1892-3, amounted to £139,496,934. The interest payable from public funds (rates and taxes) was, in addition, £45,470,978 (*Inland Revenue Report*, 1893-94, C-7557).

* It has been assumed throughout that one person in every four is an adult male, and that there are, on an average, five persons to each family group.

† It may be observed that the estimated amount of "money" or currency in the country is about £130,000,000, or under £4 per head, including bank notes. Gold coin and bullion, between £80,000,000 and £100,000,000; silver and bronze, £15,000,000; bank notes, beyond gold reserves, £24,000,000 (W. S. Jevons, *Investigations in Currency and Finance*, p. 272; Report of Deputy-Master of the Mint, 1889; Mr. Goschen's Speech on Second Reading of the Coinage Act, 1891).

‡ In 1843 this total was (for Great Britain only) £95,284,497; in 1855 (for the United Kingdom), £124,871,885.

"That these amounts are understated may be inferred from Mr. Mulhall's estimate of the stocks, shares, bonds, etc., held in Great Britain alone, as being worth £2,655,000,000, producing an annual income of upward of £220,000,000 (*Dictionary of Statistics*, p. 106). Sir Louis Mallet estimates the English income from foreign investments alone at £100,000,000 annually (*National Income and Taxation* (Cobden Club), p. 13), and later returns show that this estimate must be increased by £20,000,000.* Nearly the whole of this vast income may be regarded as being received without any contemporary services rendered in return by the owners as such.

"We have, however, to add the interest on capital employed in private undertakings of manufacture or trade. This is included with 'wages of superintendence' in business profit, both for the purpose of the income-tax returns and in ordinary speech. Mr. Giffen estimated it in 1884, apart from any earnings of personal service, at £80,000,000 (*Essays in Finance*, vol. ii., p. 402). Allowing for the increase since then, the total amount of interest cannot therefore be less than £280,000,000.

"Adding hereto the rent mentioned in the preceding section, we have a total of £510,000,000 for rent and interest together. This estimate receives support from the fact that the amount under these heads actually assessed for income tax was in 1892-93, £400,000,000 (*Inland Revenue Report*, C-7557). It has often been stated by the Commissioners of Inland Revenue that large amounts of interest escape assessment, and it is well known that much is assessed under other heads.

(c) Profits and Salaries.

"It is convenient for statistical purposes to include under this head all those who do not belong to the 'manual-labor class.' If we take the 'rent of ability' to have increased in the same proportion as the assessments to income tax, this prosperous body may be estimated to receive for its work about £410,000,000 annually.

"Mr. R. Giffen, total income, less rent, interest, and wages of manual-labor class (*Essays in Finance*, vol. ii., p. 404), £313,000,000; Professor A. Marshall, earnings of all above the manual-labor class (*Report of Industrial Remuneration Conference*, p. 194), £300,000,000; Mr. Mulhall, income of tradesmen class only (*Dictionary of Statistics*, p. 320), £244,000,000; Mr. R. Giffen, salaries of superintendence assessed to income tax alone (*Essays in Finance*, vol. ii., p. 404), £180,000,000.

"The total drawn by the legal disposers of what are sometimes called the 'three rents' (on land, capital, and ability) amounts, therefore, at present to about nine hundred and twenty million pounds sterling yearly, or nearly two thirds of the total produce. The following estimates, framed some years ago, support this view: Mr. Giffen, *Essays in Finance*, vol. ii., p. 467, £720,000,000; Mr. Mulhall, *Dictionary of Statistics*, p. 246, £818,000,000; Professor Leone Levi (King's College, London), *Times*, January 13, 1885, £753,000,000; Professor Alfred Marshall (Camb.), *Report on Industrial Remuneration Conference*, p. 194, £675,000,000.

"The manual-labor class receives, on the other hand, for all its millions of workers, only some five hundred and thirty millions sterling: Mr. Giffen, *Essays in Finance*, vol. ii., p. 467, £550,000,000; Mr. Mulhall, *Dictionary of Statistics*, p. 320, £467,000,000; Mr. J. S. Jeans, *Statistical Society's Journal*, vol. xlviii., p. 631, £600,000,000; Professor Leone Levi (as above), £521,000,000; Professor A. Marshall (as above), £500,000,000.† P.—Total produce, £1,450,000,000; W.—Income of manual-labor class, £530,000,000; income of the legal proprietors of the three natural monopolies of land, capital and ability, £920,000,000.‡

* See *Fabian Tract*, No. 7, "Capital and Land," p. 6.

† These estimates, which are based on average rates of wages, multiplied by the number of workers, assume, however, reasonable regularity of employment, and take no account of the fact that much of the total amount of nominal wages is reclaimed from the workers in the shape of ground rent. Much must, therefore, be deducted to obtain their real net remuneration.

‡ In this connection it may be mentioned that the total income of the charities of the United Kingdom, including endowments, amounts to £10,040,000, or little over 1 per cent. of the foregoing total. £2,040,000 of this, it may be added, is expended upon Bible societies alone (Mulhall, *Dictionary of Statistics*, p. 112). The total cost of poor relief in 1891-92 was £10,815,030 (*Statistical Abstract*, C-7143).

ESTIMATED WEALTH OF THE LEADING COUNTRIES OF THE WORLD—1888.

Adapted from Mulhall's *Dictionary of Statistics*, 1892, page 589. English pounds converted into dollars at \$4.8665 per pound.

III. THE DISTRIBUTION OF WEALTH.

(a) IN THE UNITED STATES.

An estimate of the distribution of the wealth in the United States was made by Mr. Thomas G. Shearman in the *Forum* for 1889 and for January, 1891. It was based on careful estimates of the wealth of the very wealthy, a list of which he gave, and estimates of the division of the remaining wealth of the country between the middle class and the poor, based on assessors' returns. Mr. Shearman came to the conclusion that 1.4 per cent. of the population own 70 per cent. of the wealth; 9.2 per cent. of the population own 12 per cent. of the wealth; and 89.4 per cent. of the population own only 18 per cent. of the wealth.

Mr. G. K. Holmes, expert on wealth statistics for the tenth census, follows the contrary method, and by estimating the wealth of the poor, arrives at the wealth of the rich. He finds that 0.3 per cent. of the people own 20 per cent. of the wealth; 3.97 per cent. of the people own 51 per cent. of the wealth; and 91 per cent. of the people own only 29 per cent. of the wealth.

The fact that Mr. Holmes is not a partisan, either of conservatism or radicalism, gives to his estimates an unwonted value. As published in the *Political Science Quarterly* and in the *Journal of the Royal Statistical Society* they are in brief as follows:

Tenants of farms and homes...	7,871,099	\$2,837,049,500
Owners of mortgaged farms and homes worth less than \$5,000.....	1,483,356	2,614,955,764
Owners of free farms and homes worth less than \$5,000.....	3,078,077	10,946,616,952
Owners of farms and homes worth \$5,000 or over.....	1,257,620	48,600,000,000

A third estimate was made by Dr. Charles B. Spahr, based on returns from the clerks of the surrogate courts in New York State. As given by Dr. Spahr in his *The Present Distribution of Wealth in the United States* (1896), his conclusions are as follows:

FOR KINGS COUNTY (NEW YORK CITY)

	Number.	Realty.	Personality.	Total.
\$50,000 and over....	27	\$2,872,100	\$4,101,000	\$6,973,100
\$50,000 to \$5,000....	147	1,029,250	1,070,080	2,099,330
Under \$5,000.....	336	135,330	376,700	512,030
	510	\$4,036,680	\$5,547,780	\$9,584,460

THE UNITED STATES, 1890.

ESTATES.*	Number.	Aggregate Wealth.	Average Wealth.
The wealthy classes, \$50,000 and over....	125,000	\$33,000,000,000	\$264,000
The well-to-do classes, \$5,000 to \$50,000.....	1,375,000	23,000,000,000	16,000
The middle classes, \$500 to \$5,000.....	5,500,000	8,200,000,000	1,500
The poorer classes, under \$500.....	5,500,000	800,000,000	150
	12,500,000	\$65,000,000,000	\$5,200

The conclusion reached, therefore, is that less than half the families in America are property-

less ; nevertheless, seven eighths of the families hold but one eighth of the national wealth, while 1 per cent. of the families hold more than the remaining 99. Dr. Spahr adds :

“ Since the completion of this study, a volume has appeared that must set at rest all question as to extreme moderation of the estimates reached. Part II. of the Report of the Massachusetts Bureau of Labor Statistics for 1894 publishes the inventoried probates for the entire State of Massachusetts during the three years 1880, 1890, and 1891. Altho the estates for which no inventories are filed are, as a rule, the largest, the following concentration of property is exhibited :

INVENTORIED ESTATES IN MASSACHUSETTS, 1880-91.

	Number.	Value.
Under \$5,000.....	10,152	\$16,889,479
\$5,000 to \$50,000.....	3,947	53,489,893
\$50,000 and over.....	509	85,179,416
	14,608	\$155,558,788

“ In other words, the estates of \$50,000 and over aggregated 55 per cent. of the total amount of property ; while estates less than \$5000 aggregated but 11 per cent. of the total.”

As to the development of trusts, says Mr. G. B. Waldron (*A Handbook on Currency or Wealth*) :

“ Of the manufacturing and mechanical industries, whose statistics were returned in the census of 1890, there are 43 whose manufactured product for the year 1889 was above \$30,000,000, whose capital averaged above \$10,000 per establishment, and which admitted of comparison with the census of 1880. Of these 43 industries we have chosen 30 as especially illustrating the growing concentration of capital during the 10 years from 1880 to 1890. (See pp. 106 and 107.)

“ It is a significant fact that while in 1880 these industries were carried on by 84,708 establishments, or about 33 per cent. of the total number of manufacturing establishments of the country, the same industries in 1890 were carried on by only 69,659 establishments, or about 22 per cent. of the total establishments, and fewer in number by over 15,000 than in 1880.

“ The value of the total product of these 30 industries in 1880 was \$3,125,915,574, or 58 per cent. of the total manufacturing products of the country. In 1890 these same industries produced products to the value of \$4,595,804,626, or about 51 per cent. of the total product.

“ The concentration of capital in these 30 industries is shown from the fact that in 1880 their total capital was \$1,735,577,549, or an average of \$20,489 per establishment, while in 1890 their total capital reached \$3,468,277,249, or \$49,789 per establishment, a gain of 143 per cent. in 10 years. There has been a similar concentration of employees in these industries. In 1880 the 84,708 establishments used 1,340,400 employees, or an average of 16 to an establishment. In 1890 there were 1,964,232 employees in these industries, or an average of 28 to an establishment.”

(b) OTHER COUNTRIES.

(For Great Britain, see also Part II. of this article.) Dr. Spahr, however, in his *The Present Distribution of Wealth in the United States*, gives much information as to the distribution of property in Great Britain and other countries.

After a careful analysis, he says :

“ The table, therefore, for the property-owners of the United Kingdom would divide the aggregate private wealth approximately as follows :

DISTRIBUTION OF PRIVATE PROPERTY.

(United Kingdom, 1891.)

	Persons Owning.	Amount Owned.
Below £1,000.....	2,000,000	£300,000,000
£1,000 to £10,000.....	500,000	2,000,000,000
£10,000 and over.....	125,000	7,900,000,000
	2,625,000	£10,700,000,000

The number of property-owning families would be about one third less than the number of property-owners. There remain, therefore, nearly 6,000,000 families, or more than three fourths of the people of Great Britain and Ireland, without any registered property whatever. They have, indeed, their household goods, but the total value of these can hardly exceed £100,000,000. If we sum up, therefore, the results of our inquiry, we find that less than 2 per cent. of the families of the United Kingdom hold about three times as much private property as all the remainder, and that 93 per cent. of the people hold less than 8 per cent. of the accumulated wealth.”

Of incomes, he says (p. 79) :

“ The minimum concentration would be as follows :

UNITED KINGDOM in 1885.

INCOMES.	Number.	Aggregate.
£1,000 and over.....	130,000	£420,000,000
£1,000 to £100.....	1,400,000	290,000,000
Below £100.....	14,500,000	470,000,000
	16,030,000	£1,180,000,000

“ In brief, about 1 per cent. of those having incomes receive over 35 per cent. of the national income, while about 10 per cent. receive half as much again as the remaining 90.”

For Paris, Dr. Spahr gives a table based on one prepared by Leroy Beaulieu from reports of the taxes on rent.

In a condensed form the table stands thus :

Number of Incomes.	Classes of Incomes.	Amount of Incomes.	Percentage of No.	Percentage of Amt.
468,641	Below 2,400 f.	750,000,000 f.	68.4	24
156,590	2,400-7,500 f.	640,000,000 f.	22.8	20.46
44,853	7,500-32,000 f.	610,000,000 f.	6.5	19.54
14,868	Above 32,000 f.	1,125,000,000 f.	2.3	36
684,952		3,125,000,000 f.	100	100

“ In brief, the incomes above \$6000, tho numbering less than 2½ per cent. of all, aggregated more than one third of the total income of the city ; while incomes above \$1500, tho numbering less than 10 per cent. of all, aggregated more than one half of the total income.”

Of Germany, Dr. Spahr says (pp. 83, 84) :

“ In Germany the degree of concentration is less than in Great Britain or Paris, tho each decade and each reform in the method of assessing the income tax reveals greater concentration. A dispassionate statement of the change that has been going on was made by the

late Professor Roscher.* Between 1852 and 1873 the number of incomes in Prussia assessed between \$300 and \$750 increased 175.5 per cent.; the number assessed between \$900 and \$18,000 increased 470.6 per cent.; while the number assessed at more than \$40,000 increased 2200 per cent. This disproportionate increase of large incomes continues to the present day. Soetbeer's table of Prussian incomes for 1890 is shown to be obsolete, or worse, by the assessments for 1892-93. His estimates for the large incomes must be doubled to conform with the newer tax lists. From these it appears that a little over 1 per cent. of those receiving incomes hold more than 20 per cent. of the income of the kingdom, while 10 per cent. hold nearly one half of it."

Of Basel, Dr. Spahr says (p. 87) :

"In this Swiss city, where all but the very small incomes are given officially, the wealthiest 5 per cent. of the families held more than half of the income, and the wealthiest 10 per cent. fully three fifths of it. The similarity, however, between this result and that reached for the United Kingdom and for Paris does not indicate that incomes are as concentrated in Basel as in Paris or England, but merely demonstrates that

the estimates previously given respecting the concentration of incomes were minimum estimates."

IV. IS THE CONCENTRATION OF WEALTH INCREASING ?

(a) THE NEGATIVE VIEW.

Among those who hold that the concentration of wealth is not on the increase perhaps the ablest argument has been made by Mr. Giffen, president of the English Statistical Society, and the most popular argument by Mr. W. H. Mallock. In the United States, the strongest holder of this view is Mr. Edward Atkinson.

Mr. Giffen, in his inaugural address as president of the Statistical Society in 1883, based an argument for the growing diffusion of wealth upon probate returns and assessment records. He presented the following tables and statement :

STATEMENT OF NUMBER OF PROBATES GRANTED IN 1882, WITH AMOUNTS OF PROPERTY PROVED, AND AVERAGE PER PROBATE FROM FIGURES (SUPPLIED BY THE COMMISSIONERS OF INLAND REVENUE); AND COMPARISON WITH A SIMILAR STATEMENT FOR 1838 (FROM PORTER'S "PROGRESS OF THE NATION," p. 600 *et seq.*).

	NUMBER OF PROBATES.		AMOUNT OF PROPERTY.		AMOUNT OF PROPERTY PER ESTATE.	
	1882.	1838.	1882.	1838.	1882.	1838.
England	45,555	21,900	£118,120,961	£47,604,755	£2,600	£2,170
Scotland	5,221	1,272	13,695,314	2,817,260	2,600	2,200
Ireland	4,583	2,196	8,544,579	4,405,240	1,900	2,200
United Kingdom.....	55,359	25,368	£140,360,854	£54,887,255	£2,500	£2,160

"In spite of the enormous increase of property passing at death, amounting to over 150 per cent., which is more than the increase in the income-tax income, the amount of property per estate has not sensibly increased. The increase of the number of estates is more than double, and greater, therefore, than the increase of population; but the increase of capital per head of the capitalist classes is in England only 19 per cent., and in the United Kingdom only 15 per cent. Curiously enough, I may state, it is hardly correct to speak of the capitalist classes as holding this property, as the figures include a small per cent. of insolvent estates; but allowing all the property to belong to the capitalist classes, still we have the fact that these classes are themselves increasing. They may be only a minority of the nation, tho I think a considerable minority, as 55,000 estates passing in a year represent from 1,500,000 to 2,000,000 persons as possessing property subject to probate duty; and these figures, it must be remembered, do not include real property at all. Still, small or large as the minority may be, the fact we have before us is that in the last 50 years it has been an increasing minority, and a minority increasing at a greater rate than the increase of general population. Wealth, to a certain extent, is more diffused than it was. . . . The next piece of statistics I have to refer to is the number of separate assessments in that part of schedule D known as Part I., *viz.*, trades and professions, which excludes public companies and their sources of income, where there is no reason to believe that the number of separate assessments corresponds in any way to the number of individual incomes. Even in Part I. there can be no exact correspondence, as partnerships make only one return; but, in comparing distant periods, it seems not unfair to assume that the increase or decrease of assessments would correspond to the increase or decrease of individual incomes. This must be the case, unless we assume that in the interval material differences were likely to arise from the changes in the number of partnerships to which individuals belong, or from partnerships as a

rule comprising a greater or less number of individuals. Using the figures with all these qualifications, we get the following comparisons :

NUMBER OF PERSONS AT DIFFERENT AMOUNTS OF INCOME CHARGED UNDER SCHEDULE D IN 1843 AND 1879-80 COMPARED (IN ENGLAND).*

	1843.	1879-80.
£150 and under	39,366	130,101
200 and under	28,370	88,445
300 and under	13,429	39,806
400 and under	6,781	16,501
500 and under	4,780	11,317
600 and under	2,672	6,894
700 and under	1,874	4,054
800 and under	1,442	3,595
900 and under	894	1,396
1,000 and under	4,228	10,352
2,000 and under	1,235	3,131
3,000 and under	526	1,430
4,000 and under	339	758
5,000 and under	493	1,439
10,000 and under	200	785
50,000 and upward.....	8	68
Total	106,637	320,162

"Here the increase in all classes, from the lowest to the highest, is between two and three times, or rather more than three times, with the exception of the highest class of all, where the numbers, however, are quite inconsiderable; again a proof, I think, of the greater diffusion of wealth, so far as the assessment

* *Political Economy*, Book III., chap. vii., sec. ccv.

* The figures for 1843 cannot be given for either Scotland or Ireland.

of income to income tax under Schedule D may be taken as a sign of the person assessed having wealth of some kind, which I fear is not always the case. If the owners of this income, at least of the smaller incomes, are to be considered as not among the capitalists, but among the working classes—a very arguable proposition—then the increase of the number of incomes from £150 up to, say, £1000 a year, is a sign of the increased earnings of the working classes, which are not usually thought of by that name. The increase, in this instance, is out of all proportion to the increase of population."

Mr. W. H. Mallock, in his book *Classes and Masses* (1896), has made a more popular argument to show that the poor are not growing poorer and the rich richer, that the middle classes are not disappearing. He admits that there are absolutely more poor to-day in Great Britain than formerly, but says that in proportion to the population there are not so many, while the increase of the moderately well-to-do has been enormous. In 1850 he says that there were 9 paupers for every 200 inhabitants, and in 1882 only 5.

Basing his statements on statistics tabulated by Professor Leone Levi, Mr. Mallock argues that according to the returns of those paying taxes on incomes, the working classes have increased 15 per cent. and the middle class over 300 per cent.

In the United States, Mr. Atkinson comes to similar conclusions. He quotes from census and other reports to show that wages are rising and prices are falling (see, however, WAGES), and thus argues that the real wages of most workers are rapidly rising. On the other hand, he shows that the rate of interest is falling; that the amount of capital relative to production is increasing; and from this argues that the wealthy get a steadily lessening share of an ever-increasing product. He sums up his conclusions thus (*The Century*, vol. xxxiv., pp. 569-584):

"Leaving wholly out of view the transfer of property already saved from one person to another in the gambling operations of the stock exchange, such incidents being of no material consequence except to those who engage in them, we may observe—

1. That the direction and use of capital are becoming more and more a matter of scientific training, as the margin of profit in every art comes to a less and less fraction of the product made or distributed. The merchant adventurer has gone the same way with the craftsman and his apprentice—he has disappeared with the removal of the mysteries of trade.

2. Altho great fortunes have become more conspicuous, their number is very small, and their aggregate amount is yet smaller in proportion to the amount and great number of moderate fortunes which are not conspicuous, but which are steadily increasing.

3. Adjacent to every city are suburbs or neighboring towns which are filled with comfortable dwellings of moderate size, which give evidence of comfort and welfare steadily increasing on the part of an increasing portion of those who perform the practical work of the country. These are the dwelling-places of their respective owners or occupants, who are not capitalists in any sense, but who have assured to themselves an abundant subsistence, a home, and a safe position in the community.

4. While great bonanza farms are conspicuous, they are also few in number; the increase in small farms is very rapid; and perhaps the increase has been yet more rapid compared to what it had been before agricultural machinery, science, and invention had come nearer to the farm.

5. By comparison with this rapid progress, not only of those who are in a position of wealth, but of the vast number who, altho not making great savings, are living year by year more comfortably, better housed, better clothed, and better fed, the bad condition of the very poor, and the more uncertain position

of the common laborer, whose opportunity for work is intermittent, becomes more apparent, and therefore demands urgent attention."

Of the lessening share of capital and its contribution to production, he says:

"It is not too much to say that one half as much capital as was required to do the general work of life in 1865 will now suffice to aid labor in compassing the same amount of product. That is to say, it took twice as many dollars' worth of capital to accomplish a given product 20 or 25 years since as is now needed.

"On the other hand, the owner of the capital is now compelled, whether he will or not, to be satisfied with one half the income on each unit or dollar's worth of the present capital, if he trusts only to his capital for his means of living.

"The commerce of the world now turns from one side of the globe to the other on a margin of a cent on a bushel of grain, a dollar a ton of metal, a quarter of a cent a yard on a textile fabric, or the sixteenth of a cent a pound on sugar. The cube of coal, as I have before stated, which would pass through the rim of a quarter of a dollar, when used in connection with the compound engine, will drive a ton of food and its proportion of the steamship two miles on its way from the producer to the consumer; by the invention of the triple compound, one fourth even of this fuel has been saved. The profit or loss of this great nation turns on the price of a daily glass of lager beer.

"The most beneficent factor in the lowering of prices and in raising wages has been the extension of the railway system and the reduction in the charge for the service. Vanderbilt was the typical railroad man of his day; he was also the great communist of his time, because he reduced the cost of moving a barrel of flour a thousand miles to so small a sum, that it can hardly be measured in a loaf of bread, at a margin of profit to himself and his associates which is now less than the value of the empty barrel at the end of the line."

(b) THE CONTRARY VIEW.

The best answer to Mr. Giffen's argument is Dr. Spahr's in his *The Present Distribution of Wealth in the United States* (copyright by Thomas Y. Crowell & Co., New York and Boston). Says Dr. Spahr (pp. 15-18):

"Mr. Giffen contends that during the era of savings-banks the number of estates less than £1000 has increased more than the number of larger estates. This, however, is a point that was never questioned.

"The facts which Mr. Giffen at first could not, and at last did not, state, are the facts that tell the situation. Printed at some length, the comparative tables for 1838 and the present time run as follows:

ESTATES IN 1838.*

	Num-ber.	Amount.
Between £20 and £100.....	3,945	£214,660
Between £100 and £1,000.....	14,391	5,330,000
Between £1,000 and £10,000.....	6,006	18,284,000
Between £10,000 and £100,000.....	984	23,253,000
Above £100,000.....	39	7,912,000
	25,365	£54,993,660

ESTATES IN 1891.

	Num-ber.	Amount.
Below £100, and not taxed.....	18,063	£1,060,000
Between £100 and £1,000.....	34,213	11,579,000
Between £1,000 and £10,000.....	12,203	39,957,000
Between £10,000 and £100,000.....	2,598	70,471,000
Above £100,000.....	170	43,328,000
	67,247	£166,395,000

* Porter's *Progress of the Nation*, pp. 609 et seq.

"In other words, the exceptionally great increase in the number of estates under £1000 was entirely in the savings-bank depositor class, and the increase here was in part due to the fact that in 1838 estates under £200 were not recorded. In 1838 the 18,000 estates less than £1000 held 10 per cent. of the personal property admitted to probate, while in 1891 the 52,000 estates of this character held less than 8 per cent. On the other hand, the smallest increase in the number of estates above £1000 was in the class of medium holdings. In 1838 the estates with more than £10,000 held 57 per cent. of the wealth, while in 1891 the estates of this character held 67 per cent. If we consider the comparative gains of the very rich, the contrast is still more striking. In 1838 the personal estates worth over £100,000 aggregated but one and a half times as much wealth as the estates less than £1000; in 1891 they aggregated three and a half times as much. Common observation has not exaggerated the relative gains of the richer classes.

"These figures, it must be recalled, relate only to personal property, where the law and customs of primogeniture do not seriously impede the division of estates. They therefore reveal only the brighter part of the history. The number of owners of real estate has been artificially kept from increasing with the increase of the population. New buildings have been erected by new owners, but the ownership of the land remains in as few hands as it did half a century ago. Indeed, the ablest authority upon this subject maintains that the number of landowners is still diminishing.*

"Gregory King's table of the comparative incomes of the various classes in 1688 proves indisputably that England at the close of the Middle Ages was pre-eminently a nation of small proprietors. As Prothero remarks concerning it, 'whatever allowance is made for errors, the contrast is startling enough' between the England in which 'three fifths of the agriculturists enjoyed proprietary interests in the soil' and the England of to-day, in which four fifths of the agriculturists are hired laborers. This contrast is heightened when King's table is compared with the returns in the New Domesday Book of 1875. King placed the total rent of agricultural land at £10,000,000, yet estimated the aggregate income of 1500 lords, baronets, and knights at less than one fifth of that sum. In our day Arthur Arnold estimates that four fifths of the United Kingdom belongs to a smaller proportion of the population."

As for Mr. Mallock's contention that the advance in modern wealth has been mainly by the enormous growth of a middle class out of the ranks of the working classes, it must be remembered what he means by the middle class. He includes (they are his own words) all receiving an income less than £1000. He is thus able to include in his middle class many very wealthy, and thus to show a large middle class and a small wealthy class. But accepting his division, no one claims that the *number* of the extremely rich has lately increased. It is only their wealth which has increased. In 1838 (see tables quoted above) they had in personal property £49,449, and in 1891, £153,756. The rich, in spite of Mr. Mallock, are getting richer. As for those getting less than £1000, the 18,000 estates of this kind held in 1838 10 per cent. of the personal property, and in 1891 the 52,000 of this kind held only 8 per cent. of the property. Mr. Mallock makes small gain for his cause by showing that the middle class is growing in numbers. It is their relative wealth that is disappearing, as the rich, he admits, do grow richer and the poor grow relatively poorer.

As for the United States, since 1873 the poor have grown relatively, if not absolutely, poorer. (See WAGES for proof of this.) Mr. Atkinson's statements that wages have risen

and prices fallen are based on government reports, shown in article WAGES to be false. As for his argument that the rich are not getting richer, because the rate of interest is falling, and it takes more capital relatively to production than formerly, it must not be forgotten that the rate of interest is not the same as the rate of profits.

The
United
States.

These may be high where interest is low, and the fact that it does take more capital to-day than formerly relatively to production simply shows that only the strongest concentration of capital can succeed to-day, and therefore that the productive capital of the country is in concentrated hands. They may make profits to-day at lower rates, but they have such enormous accumulations that their income is vastly larger than before. Never was capital thus so concentrated as now.

In the United States, then, wealth has increased phenomenally; wages since 1873 have fallen; the concentration of capital has increased; the number of the out of work has grown. (See UNEMPLOYMENT.)

WEBB, BEATRICE, daughter of Richard Potter, some time President of the Grand Trunk Railway of Canada, etc., was born in 1858. A pupil of Herbert Spencer, she studied actual working-class life in Lancashire and East London; in 1885 joined Mr. Charles Booth in his social investigations, and contributed articles, on the docks, the tailoring trade, and the Jewish community, to *Life and Labor of the People*. In 1888 she gave her experience in sweating dens to the House of Lords Committee on Sweating. In 1891 she published *The Cooperative Movement in Great Britain*. In 1892 she married Sydney Webb (*q.v.*). In 1894 they published *Trades-Unionism*. She is a member of the Fabian Society (London).

WEBB, SYDNEY, LL.B. (London University), barrister at law, was born in 1859, and educated in Switzerland and Germany; in 1878, after some business experience, he entered, by open competition, the English civil service, filling places successively in the War Office, Inland Revenue and Colonial Office. He was joint editor of *The Colonial Office List*, but resigned in 1891. He published in 1889 *Socialism in England*; he contributed the "historical" chapter in *Fabian Essays in Socialism*; in 1891 he published, in conjunction with Harold Cox, *The Eight-Hours Day* (Scott) and *The London Programme* (Sonnenschein), and in 1894, in conjunction with his wife, Beatrice Webb (*q.v.*) *Trades-Unionism*. Author of many articles and pamphlets on socialism, economics, and English politics; he has been a member since 1885 of the Fabian Society (London); elected for Deptford to the London County Council, 1892; vice-chairman of Local Government Committee, and chairman of the Technical Education Board of that body.

WEITLING, WILHELM, was born at Magdeburg in 1808. He became a tailor, but

* Hon. George C. Brodrick, *English Land and English Landlords*, chap. iii. (Published by the Cobden Club.)

later traveled through Germany, one of the earliest pioneers of German socialism, declaring that he was converted to communism by the reading of the New Testament. He preached a Utopian socialism, mainly fashioned after the ideas of Fourier and Cabet. In 1847 he went to America, but returned to Germany at the Revolution of 1848. Later he came again to America, and formed a socialist society in New York City called the Arbeiterbund. He interested himself for four years in a socialistic colony situated in Wisconsin, but remained mainly in New York, living as a clerk, but devoted himself to reform, inventions, and science. He wrote *Die Menschheit wie sie ist und wie sie sein sollte* (1838); *Garantien der Harmonie und Freiheit* (1842); and *Das Evangelium eines Armen Sünders*. His constructive idea was a federation of the families of the world, with leaders chosen by acclamation, who should divide the products of labor, giving to all a fixed share, and to those who produced more than the average certain luxuries, on condition of their being soon consumed to prevent accumulation. He died in 1874.

WELLS, DAVID AMES, was born at Springfield, Mass., in 1828, and graduated at Williams College in 1847; Lawrence Scientific School, Cambridge, in 1851. He was engaged in scientific pursuits and inventions in chemistry till 1861. In 1862 and 1867 he visited Europe on commissions of the United States Government; was United States Special Commissioner of Revenue, 1866-70. He became University Lecturer on Political Economy at Yale College in 1872. He has produced 15 important reports for the United States, and numerous papers for scientific bodies in Europe and America. His principal economic writings are: *The Creed of the Free Trader* (1875); *Robinson Crusoe's Money* (1876); *Practical Economics* (1886); *Economic Changes* (1889); *Relation of the Tariff to Wages* (1888). He is best known for his able advocacy of free trade (*q.v.*), civil service reform, and gold monometallism. (See **MONOMETALLISM**.)

WESCOTT, BROOKE FOSS, Bishop of Durham, was born near Birmingham in 1825. He was educated at Trinity College, where he was successively Scholar, Fellow (1849), and Professor of Divinity (1870). He was also at different times assistant master at Harrow, a canon of Peterborough and of Westminster, chaplain to the Queen and to the Archbishop of Canterbury. He was consecrated Bishop of Durham in 1890. Besides his numerous writings on the Bible and other religious subjects, he has written *Social Aspects of Christianity*; *The Incarnation and Common Life*. He is President of the Christian Social Union (*q.v.*).

WHATELY, RICHARD, was born in London, Eng., in 1787. He studied at Oriel College, Oxford; became a Fellow of Oriel in 1811; was Bampton Lecturer for 1822; rector of Halesworth, 1822-25; Professor of Political Economy at Oxford, 1830-31; and appointed Archbishop of Dublin in 1831. He was prominent for carrying out the principles of the Ro-

man Catholic Relief Act; was for 20 years the leading member of the Irish National Board of Education. He is also associated with "Broad Church" divinity. Besides numerous philosophical and religious writings, he published *Lectures on Political Economy* in 1831.

WHISKY RING.—This was a conspiracy between United States revenue collectors and distillers, originating in St. Louis in 1872, spreading into many Western cities, and attaining great political power. Its aim was to defraud the Government in the collection of the tax on distilled spirits. The method of defrauding was by the secret shipment of whisky reported as stored. In 1874 a discrepancy was discovered between the returns of shipments of the Merchants' Exchange of St. Louis and those of the revenue officers. Benjamin H. Bristow, Secretary of the Treasury, unearthed the fraud. A general seizure in three cities was made May 10, 1875. Property aggregating \$3,500,000 in value was seized, and 238 persons were indicted. When the papers in these cases were laid before President Grant, he indorsed one of them, with the injunction, "Let no guilty man escape." O. E. Babcock, President Grant's private secretary, was implicated, but tho acquitted, his guilt was generally conceded. No charge was ever made implicating Grant, but his tenacity in supporting his friends, even when their guilt was evident to others, made it easy for the ring to put many obstacles in Bristow's way. In one case, even, documents were tampered with. Many convictions were obtained, among others that of the chief clerk of the Treasury, Avery.

WHITE CROSS SOCIETY, THE.—The White Cross movement was begun, publicly, February 14, 1883, at Bishop-Auckland, Eng., by the Bishop of Durham, Miss Ellice Hopkins being present and bearing a prominent part. The work was taken up in this country by the Rev. B. F. De Costa, D.D., Rector of the Church of St. John the Evangelist, New York City, aided by his young men, during the winter of 1883-84. It has now spread throughout the United States.

The principal purposes of this organization are:

(1) To urge upon men the obligation of personal purity; (2) to raise the tone of public opinion upon the subject of morality; (3) to secure proper legislation in connection with morality.

The member promises by the "help of God" (1) to treat all women with respect, and endeavor to protect them from wrong and degradation; (2) to endeavor to put down all indecent language and coarse jests; (3) to maintain the law of purity as equally binding upon men and women; (4) to endeavor to spread these principles among my companions, and to try and help my younger brothers; (5) to use every possible means to fulfil the command, "Keep THYSELF pure."

The methods of the White Cross are of a varied character. All aim to fulfil its declared object: "By the full presentation of those spiritual truths which form distinguishing characteristics of Christianity, and demonstrate its unalterable hostility to every form of impurity." The methods do not favor so much the creation of new machinery as utilizing that already existing. (See **SOCIAL PURITY**.)

WHITE RIBBONERS. See **WOMEN'S CHRISTIAN TEMPERANCE UNION**.

WILBERFORCE, WILLIAM, was born at Hull, Eng., in 1759. The son of a wealthy merchant, he was educated under Methodist principles at Wimbledon and at St. John's College, Cambridge. In 1780 he was elected to the House of Commons and became an intimate friend of Pitt, tho always voting independently. In 1787 he organized a society against vice, and soon after was influenced by Clarkson toward his great lifework. In 1789 he first proposed the total abolition of the slave trade, and in 1807 his bill was carried in the House of Commons and through the House of Lords. He still, however, labored for its victory in Parliament and without. In 1822 he shared in the founding of an anti-slavery society. He died in 1833, one month before the passage of the Emancipation Bill. (See SLAVERY.) He was interested in many other reforms, and published in 1797 *A Practical View of the Prevailing Religious System of Professed Christians in the Higher and Middle Classes Contrasted with Real Christianity*.

WILLARD, FRANCES ELIZABETH, was born in Churchville, N. Y., September 28, 1839. Her ancestors were Puritans, having emigrated from Kent, Eng., on account of religious persecution, in 1634. Miss Willard's parents removed to Oberlin, O., in 1841, where they were students in the college until 1846, when they went to Wisconsin and founded "Forest Home," near Janesville, going to Evanston, the chief suburb of Chicago, where they built "Rest Cottage," in 1858. Here Miss Willard graduated from the Women's College, which later became connected with the Northwestern University. In 1861 she became a teacher, and continued in this capacity for 15 years, beginning in the public school of her own town and ending as Professor of English Composition in the university. In 1868 she went abroad, where she traveled and studied for nearly two years and a half. On her return she was made president of the Women's College in Evanston, and began to lecture on woman's higher education, women's foreign missionary work, and kindred topics. In 1874, after the women's temperance crusade, she began her temperance work as president of the Chicago W. C. T. U. She was also made secretary of the Illinois W. C. T. U., and in November of that year, at the first convention of the National W. C. T. U., became its corresponding secretary. The headquarters established by Miss Willard in Chicago were the first attempt to organize and systematize an office for the new movement.

In 1878 Miss Willard became the chief editor of the Chicago *Daily Evening Post*. In that year she was elected president of the National W. C. T. U. on the issue of a wider outlook for the society, which should embrace correlated movements.

In 1879, presiding over her first national convention in Boston, she suggested the following classification of departments, with a superintendent for each: Preventive, Educational, Evangelical, Social, Legal, and Department of Organization.

In 1880, accompanied by the Misses Gordon,

Miss Willard made a tour of all the Southern States, introducing a knowledge of the spirit and method of the White Ribbon Movement.

In 1883 Miss Willard and her secretary, Miss Anna Gordon, visited every State and Territory in the United States and several Canadian provinces, holding the first temperance conventions ever called together in several of the Western Territories. From that time the Temperance National Society has had duly elected delegates to its conventions from almost every one of the 50 subdivisions of the United States. In 1883, on her return from California, she proposed to the National W. C. T. U. a plan for organizing the World's W. C. T. U., which was accepted, and the polyglot petition to all governments was sent out. This petition has now received 3,000,000 signatures and attestations in 50 languages.

She has been allied with the Prohibition Party from the time when, on her trip to the South, in 1881, she found there was no "bloody chasm." If the Republican Party had favored the home protection movement she would not have left it; but as it took no such action she went to the Prohibition Party Convention in Pittsburg (1884), and by invitation of the Kansas delegation seconded the nomination of Governor St. John for President of the United States, from which time she has cooperated with the Prohibition Party, in whose favor the National W. C. T. U. Convention declared in 1884 at the St. Louis Convention.

In 1885 she urged upon the National W. C. T. U. Convention the importance of adding a Department of Social Purity work to those already formed, which was done, and she was placed at its head. Petitions were then circulated in all parts of the United States asking for the better protection of women, and much has been gained in the way of legislation. She was made a member of the General Conference of the Methodist Church, to which she has belonged since her girlhood, but a ruling of the bishops prevented any recognition of this election. She is now editor-in-chief of the *Union Signal*, official organ of the World's and National W. C. T. U., and corresponding editor of Lady Henry Somerset's paper, *The Woman's Signal* (London), also one of the editors of *Our Day*, founded by Joseph Cook of Boston. She has also written *Nineteen Beautiful Years, Hints and Helps for the W. C. T. U., Women and Temperance, How to Win, Woman in the Pulpit, A Classic Town, Glimpses of Fifty Years, A Young Journalist*, and has collaborated a volume entitled *A Great Mother, the History of St. Courageous*.

Miss Willard is one of the founders of the National and International Women's Council, having been chairman of the committee that drafted its constitution and plan of work, and was first president of the council.

In 1892, on the death of her mother, Miss Willard's health became impaired, and she has since then had to devote much time to resting in England and elsewhere, yet continually lec-

Temperance Work.

Other Reforms.

turing and guiding the movements she has at heart.

Miss Willard's devotion to the cause of woman's suffrage and the labor movement is well known. She is the author of the "home protection" movement, which means the ballot for women as a method of temperance work; also of the expressive phrase "The do-everything policy of the W. C. T. U." She has often stated her platform in these words: "No sectarianism in religion, no sectionalism in politics, no sex in citizenship!" In economics she calls herself a Christian Socialist.

To her constant diligence in work is owing the fact that she has built up the largest organization of women in the world. Her remarkable talents, that would have won for her fame in any calling in life, have been devoted to the cause of reform. The salient feature of her fame will always be the fact that she combined an equal talent for writing, speaking, and organization, a combination as rare as it is invaluable in the leader of a great new movement.

ISABEL SOMERSET.

WILSON, WOODROW, was born December 28, 1856, at Staunton, Va., where his father was pastor of the Presbyterian Church. He studied one year at Davidson College, North Carolina, and four years, 1875-79, at Princeton. After studying law at the University of Virginia, he practised his profession in Atlanta. He left his work at the law to study at Johns Hopkins University, 1883-85, taking the degree of Ph.D. in the year 1886. Dr. Wilson has been Professor of History and Political Economy at Bryn Mawr College and Wesleyan University, and since 1890 at Princeton College.

The principal works of Professor Wilson are: *Congressional Government, a Study in American Politics* (Boston, 1885); *The State, Elements of Historical and Practical Politics* (Boston, 1889). Of the last work the chapter on the government of the United States has been published separately under the title *State and Federal Governments of the United States* (Boston, 1889). Professor Wilson has also contributed articles to the *International Review*, *Atlantic Monthly*, *Political Science Quarterly*, and *Overland Monthly*, on political subjects.

WINKELBLECH is the name of a little-known German professor of chemistry, who, under the pseudonym of "Carl Marlo," wrote in 1850 a book now recognized as one of the ablest statements of German socialism. He was traveling to study technological subjects when, in 1843, at Modum, Norway, he met a German artisan and became interested in what he heard and saw of the sufferings of the working classes. The result was his book *Untersuchungen über der Organization der Arbeit oder System der Weltökonomie* (1851-55). Winkelblech died in 1865.

WOLOWSKI, LOUIS FRANÇOIS MICHEL RAYMOND, was born at Warsaw in 1810. He studied in Paris, but took part in the Polish Revolution of 1830. He became Professor of Law in the Conservatoire des Arts and Métiers at Paris in 1839, and sat in the Con-

stituent Assembly in 1848. His best-known works are: *De l'Organisation du Travail* (1843); *L'Or et l'Argent* (1870). He died at Gisors, France, in 1876.

WOMAN'S CHRISTIAN TEMPERANCE UNIONS, THE NATIONAL AND THE WORLD (see WOMEN'S TEMPERANCE ASSOCIATION, BRITISH), are organizations of Christian women for the protection of the home, the abolition of the liquor traffic, and the triumph of Christ's golden rule in custom and in law. They are lineal descendants of the great Woman's Temperance Crusade of 1873-74.

In December, 1873, under the inspiration of an address delivered by Dr. Dio Lewis, of Boston, the women of Hillsboro, Washington Court House, and other Ohio towns were moved to concerted action against the saloon. They gathered in the streets to pray, and marched, two by two, into saloons. They besought the men who drank, and the men who sold, to cease to gratify the appetite for stimulants and the appetite for gain, and invited them to move with the procession, as it ended its day's work at the altars of God, where the women knelt in consecration, and countless tempted men in repentance and faith. The movement spread east, west, north, and south. In 50 days it swept the liquor traffic out of 250 towns and villages. The leader of the first Crusade band was Mrs. Eliza J. Thompson, wife of Judge Thompson, of Hillsboro, known for many years as "Mother" Thompson.

But the saloon was found to be but the outcropping of the liquor system; that system was protected by law and entrenched in the very heart of our governmental life. The powers controlling it soon rallied from the shock of the sudden onslaught, and entrenched themselves even more strongly behind barricades, political and legal. The logic of events soon forced the women to enlarge the circle of their work until it should include not only "mental suasion for the man who thinks and moral suasion for the man who drinks, but legal suasion for the drunkard-maker and prison suasion for the statute-breaker."

A call for permanent organization went forth from the Chautauqua (New York) Sunday-School Assembly, August, 1874.

The National W. C. T. U. of the United States was organized November 18, 19 and 20, 1874, in Cleveland, O., the first president being Mrs. Wittenmeyer, of Philadelphia, and the first corresponding secretary, Miss Frances E. Willard (*q. v.*), of Chicago. It was incorporated March 1, 1883, in Washington, D. C.

It has now 49 auxiliary States and four territorial unions, besides that of the District of Columbia, and is the largest society ever composed exclusively of women and conducted entirely by them. It has been organized by every State and Territory of the nation, and locally in about 10,000 towns and cities. (For local convenience, California and Washington are divided into two unions each. In two States also there are separate unions of the colored women. Alaska is not organized.)

At the last National Convention the paid-up membership was reported as 147,656, but this by

History.

no means represents the full number enrolled. Without doubt there are 250,000 white-ribboners in the United States, with a direct following of as many more.

Each member is required to sign the pledge and pay the annual membership dues, which dues vary in different States, but are usually about 50 cents. Of this amount a certain per cent. is paid into the State treasury, and from the State treasury 10 cents per member is paid into the treasury of the National organization. Men are admitted as "honorary members." The National motto is, "For God, and home, and native land."

The badge is a knot of white ribbon, and was adopted in the convention of 1877. There was a division of opinion as to the proper badge, one party favoring red, white and blue; the other, royal purple. Miss Winslow, editor of *Our Union*, moved that the factions unite upon pure white. This motion was carried unanimously. White light includes all the prismatic colors, so the white ribbon is symbolic not only of purity and peace, but it includes all the correlated reforms that center in the protection of the home.

At noon each white-ribboner the world over is expected to lift her heart to God in prayer for His blessing on the work and workers, and the overthrow of the liquor system and its allies.

The declaration of principles is the following :

"We believe in the coming of His Kingdom whose service is perfect freedom, because His laws, written in our members as well as in nature and in grace, are perfect, converting the soul.

"We believe in the gospel of the Golden Rule, and that each man's habits of life should be an example safe and beneficial for every other man to follow.

"We believe that God created both man and woman in His own image, and, therefore, we believe in one standard of purity for both men and women, and in the equal right of

Principles. all to hold opinions and to express the same in the home, on the platform, in the pulpit and at the ballot-box.

"We believe in a living wage ; in an eight-hour day ; in courts of conciliation and arbitration ; in justice as opposed to greed of gain ; in 'peace on earth and goodwill to men.'

"We therefore formulate, and for ourselves adopt the following pledge, asking our sisters and brothers of a common danger and a common hope to make common cause with us, in working its reasonable and helpful precepts into the practice of every-day life :

"I hereby solemnly promise, GOD HELPING ME, to abstain from all distilled, fermented and malt liquors, including wine, beer and cider, as a beverage, and to employ all proper means to discourage the use of and traffic in the same.

"To confirm and enforce the rationale of this pledge, we declare our purpose to educate the young ; to form a better public sentiment ; to reform, so far as possible, by religious, ethical and scientific means, the drinking classes ; to seek the transforming power of divine grace for ourselves and all for whom we work, that they and we may willfully transcend no law of pure and wholesome living ; and finally we pledge ourselves to labor and pray that all these principles, founded upon the Gospel of Christ, may be worked out into the customs of society and the laws of the land."

Its lines of work are : I. Organization ; II. Preventive ; III. Educational ; IV. Evangelistic ; V. Social ; VI. Legal.

Besides these there are : 1. The affiliated interests. 2. The standing committees.

Under the six chief heads are grouped various departments, each one under the charge of a national superintendent. The total number of departments is 40 ; of affiliated interests, 3 ; of standing committees, 7 ; of branches, 2.

The principal results that the organization has been instrumental in securing are thus stated :

"Its auxiliaries have been, confessedly, the chief factors in State campaigns for statutory prohibition and constitutional amendments. It began the movement for scientific temperance education in the public schools, having been instrumental in securing laws to that end in all but four of the States ; and besides this it has secured Congressional legislation, by means of which all the Territories and the District of Columbia are brought under the same beneficent statutes.

"The work of the National W. C. T. U. among the children in Sunday-schools, Loyal Temperance Leagues and Kindergartens ; its efforts to influence college students and to train and organize young women for a philanthropic life ; its evangelistic work for non-churchgoers, for railway employees, soldiers, lumbermen, miners (especially for the drinking men of all classes), all these have proved the breadth of its comprehension and the tirelessness of its zeal. Its efforts to reach the pauper and the prisoner, to establish reformatories and homes for the wretched victims of inebriety and their suffering children, and its temperance Flower Mission must appeal to every true heart.

"It is permeating public sentiment by its steady advances upon the press through monthly and weekly temperance papers, and by its countless conventions.

"It has sought to purify the holidays of the people, coming with its sisterly influence to the fairs, celebrations, encampments, and expositions, and by its unrequited toil providing refreshments, keeping alcoholic poisons off the grounds, and circulating pure water and pure literature. It has battled for the maintenance of the Sabbath, sought to introduce the unfermented juice of the grape at the sacramental table, and to secure a day of prayer for temperance in the Week of Prayer.

"It has circulated countless petitions and addressed synods and conferences, teachers' associations and medical societies, as well as legislatures, State and national, always for one object and with one plea :

"We beseech you to refrain from the use of alcoholics, and to outlaw the liquor traffic."

"In recent years it has bravely championed the cause of woman's ballot, the labor movement and social purity. It seeks to instruct the youth of the nation, uplifting and preserving them from the ways that take hold upon death. It also strives to redeem outcast women from a slavery worse than that of chains, and by better laws to secure protection to women and girls from the outrage of brutal men. It has been instrumental in raising the age of consent in nearly every State in the Union, and its influence is being strongly felt in the purification of our literature and art."

The affiliated interests of the National W. C. T. U. are : The Woman's Temperance Publishing Association, the National Temperance Hospital, and the Temple.

The Woman's Temperance Publishing Association is a publishing house owned and controlled entirely by women, and is one of the mightiest forces in the great temperance propaganda. It issues the official organ, *The Union Signal*.

The Temperance Hospital was formally opened in 1886. At first located on Cottage Grove Avenue, Chicago, it is now occupying larger and more convenient quarters on Diversey Avenue. Its basic principle is the cure of disease without the use of alcohol as an active medicinal agent.

The Temple is a large, handsome structure on a principal street in Chicago, intended as a monument to the W. C. T. U., a source of revenue to the society, and the central home of its manifold labors. The building has been the office home of the National Union for five years, tho it is not yet the property of the W. C. T. U.

THE WORLD'S WOMAN'S CHRISTIAN TEMPERANCE UNION

is composed of the unions of the various nations where the white-ribbon work is known, and was organized in November, 1883.

It is now organized in 40 nations, with a total membership of about 500,000.

Its officers are: Frances E. Willard (*q.v.*), president; Lady Henry Somerset (*q.v.*), vice-president; Agnes E. Slack, secretary; Mrs. Mary E. Sanderson, treasurer.

It has organized a polyglot petition addressed to the governments of the world asking them to do away with the manufacture of and traffic in alcoholic liquors and opium and the legalization of impurity. It has already been presented to the President of the United States and to Queen Victoria, and its journey around the world will, probably, be undertaken in the near future.

DEPARTMENTS.

Organization.—This department is intended to systematize the work of national organizers; sending them out, upon consultation with Presidents, to such States and Territories as are in greatest need of help, that they may increase the number of local auxiliaries, and "strengthen the things which remain," introducing our methods, emphasizing the *regular payment of dues*, circulating *The Union Signal*, and building the local unions upon strong foundations of consecrated, combined and intelligent effort.

Young Women's Branch.—This department aims to enlist young women to form separate societies (Y. W. C. T. U.) for the purpose of making total abstinence a fashionable social custom, to the end that young men may be held to a higher standard of personal habits, and thus by a power, analogous to that which has effectually restrained their sisters, be shielded from contamination; also to teach young women the scientific and ethical reasons for total abstinence and prohibition, and to develop a new army of trained temperance workers to whom the care of the children's work may at once be intrusted, and who will eventually replace the veterans of the W. C. T. U.

The methods are, first, a social club (the Y. W. C. T. U. itself) in which young gentlemen become honorary members by signing the pledge and paying the membership fee; private and public entertainments; a systematic course of reading and work in Loyal Temperance Legions, night schools for boys, reading rooms, kitchen gardens, etc.

Loyal Temperance Legion Branch.—This department aims, by a regular course of study, scientific, ethical and governmental, to make our boys and girls *intelligent* total abstainers; to develop by thorough organization business methods and practical helpfulness, an army of disciplined temperance workers and enthusiastic temperance givers; identify its members, through their payment of dues and consequent representation in national and State conventions, and through their drill in department work, with the interests of the W. C. T. U., present and future.

Work among Foreigners.—This department aims to interest all persons to whom English is not the native tongue in Gospel Temperance methods and measures, and to influence them through the work of the W. C. T. U.; to introduce and circulate temperance literature; to have addresses given in their language, and, if possible, to establish newspapers; to make the vote of foreigners a temperance vote through conviction of right principles and by personal appeal and combined action. Send to national superintendent for leaflets in German and all other languages.

Work among Colored People.—This department is for the pursuance among colored people of all branches of work enumerated.

Health and Heredity.—The aim of this department is the development of the highest life, physical, mental and spiritual; instruction in the laws of health in relation to dress, food, air, exercise, cleanliness, sanitation, ventilation, mental and moral hygiene.

Preventive. It teaches the law of heredity and the right of every child to be well born. It is eminently a department for study. It is fundamental.

Non-Alcoholic Medication.—This department pre-

sents to the W. C. T. U., and through it to people in general, the teachings of eminent physicians who discard alcohol as medicine. It is vital to the success of the temperance cause, as total abstinence and prohibition principles can never triumph while alcohol continues to be a popular remedy. Its plans are the study of department literature by every W. C. T. U., and free distribution of the same; lectures showing superiority of the non-use of alcohols in sickness; distribution of pamphlets prepared by well-known and successful non-alcoholic physicians among teachers, pastors, editors, doctors, medical students and other leaders of thought.

Scientific Temperance Instruction.—This department aims to secure a nation of intelligent total abstainers through compulsory education of the whole people in their **Educational**, schools and colleges as to all laws of health, including those relating to the nature and effects of alcoholic drinks and other narcotics.

Its methods of work are the enactment and enforcement of laws requiring this study in schools under State and national control. Enforcement involves vigilance to insure right text-books and methods of teaching as presented in the *School Physiology Journal*, a monthly publication for teachers.

As the result of the work of this department, there are now 16,000,000 children of school age under temperance laws in the United States.

Physical Culture Department.—This department purposes securing State laws making *Physical Education* compulsory in all schools under public control. It seeks the highest possible physical development, under circumstances of health, upon which is based the most successful moral and intellectual growth of the child.

The plans promise great good to the mothers of the future through an improved understanding and practice of laws governing health, including common-sense methods in dress, and the use of nourishing food.

Sunday-school Work.—The Sunday-school department aims to teach the great principles of total abstinence and prohibition because of the "Thus saith the Lord" revealed in the Bible. Through the quarterly temperance lessons of the international lesson series, temperance exercises in the Sunday-school, pledge signing, concerts, rallies, mass-meetings, etc., these principles are emphasized. Special effort is made in these directions on Universal temperance Sunday—the fourth Sunday of each November.

Temperance Literature.—This department aims to prepare and circulate books, papers, leaflets, etc., for the general education of public sentiment, and also for topical study in *all the departments* of W. C. T. U. work, that our local meetings may be made interesting and profitable, and our members thoroughly educated in *all branches* of temperance reform.

Presenting the Cause.—This department aims to secure the presentation of our work before all the societies above indicated and any others of suitable character, in towns, counties, districts, States and the nation, that the W. C. T. U. and the principles it advocates may be known and indorsed in influential quarters. The method is to endeavor through members of these associations to secure the passage of a resolution approving our work and committing the associations themselves to do all in their power in their respective fields to advance the cause of total abstinence and prohibition. Our cause should also be presented to the leading associations by our ablest speakers, arrangements being made through the local unions.

Temperance and Labor.—This department is educative, aiming to assist our members to comprehend the changed industrial situation, with its effect on the work and life of the wage-earners. The methods are conferences for the study of the labor question, circular letters, addresses, articles for the press and study in our unions of standard books on the history of labor, and especially of the present conditions of laborers, and by contact with laborers as well as employers. It shall be our especial aim to ameliorate the condition of wage-earning women and children. On the other hand, we aim to discover the total abstainer in labor organizations, and to aid and encourage them to arouse interest among wage-earners in the study of the liquor problem, furnishing them with specimens of the most effective temperance literature, whether of books, papers or pamphlets, and aiding them to secure the best speakers on temperance. We also aim to secure the cooperation of laborers' wives and daughters in our unions, and to secure the publication of temperance information and argument in labor journals and the newspapers patronized by wage-earners.

W. C. T. U. Schools.—This department aims to establish schools at all summer assemblies and camp-meetings where the society's work is brought to the attention of the people; where the aim and needs of each department may be studied and the best methods brought out by competent teachers, to the end that trained workers may take the places of those now unskilled.

The Press.—This department aims to provide the press, both religious and secular, with the latest and most important news concerning the W. C. T. U. work in every department; to bring constantly before the reading public, facts, illustrations, statistics and quotations, directly and indirectly helpful in educating the public mind and conscience along this line of reform; and to correct in the same columns whence they emanate inaccurate statements with regard to our principles, methods or leadership. Particular attention is paid to the metropolitan and associated press and cooperative newspapers, also the capital cities during sessions of the legislature. To this general statement it may be added that "the printed part is less than that which, yet unprinted, waits the press."

Narcotics.—To educate is the first aim of this department; to instill into the minds of the young the injury done by tobacco and to teach adults the effects of tobacco, opium and other narcotics, not only upon the parent, but the offspring; also, to secure laws prohibiting the sale of all narcotics, including tobacco in all its forms. The special work is to organize anti-tobacco leagues, and thereby not only educate but pledge the children against tobacco, particularly in its most dangerous form, the cigarette. The lecturers are fully equipped to carry out the aims and objects of this department, and will build up and strengthen any union calling them.

School Savings Banks.—This department is in the interest of life's great economic and protective forces. Its mission is to establish the savings system in schools throughout the land; to give every child initial instruction in practical thrift; to make the boy and girl alike self-responsible, understanding, happy, temperate, industrious property-owners. Its superintendent has studied economic problems the past two years abroad, with figures, facts and literature. The school savings banks teaching in 400 schools in the United States proves it one of the greatest known popular reform factors. It curtails extravagance, intemperance, labor troubles, pauperism and crime, and directs thought into healthful, uplifting channels. The system is simple, occupying but fifteen minutes per week of school time.

Kindergarten.—This work aims to develop the child harmoniously—the head, heart and hands. In the kindergarten he is given an opportunity to express himself in work, play and song. The teacher aims to direct the child's activities into the right channel and seeks to make the school the natural, normal environment in which his best self can bud forth and grow, thus producing temperate living. If we can begin with the little child we can *form*, which is far better and easier than to *reform*.

Medal Contest Work.—This department aims to set W. C. T. U. principles before the public in the attractive form of public entertainments. Recitations, chiefly by children and young people, are given on prohibition, total abstinence, narcotics, purity, and the various other lines of our work. Judges are appointed, who pronounce upon the merits of the speakers, and a medal is awarded the successful contestant.

This department aims to keep brightly burning upon our altars the sacred fire which was kindled in the Crusade.

To train spiritually the individual worker. To permeate, by its devotional services, Bible readings and consecration, all other departments with the evangelistic spirit. To secure the establishment of the 11 A.M. devotional hour in all conventions.

Evangelistic. To emphasize the importance of the noontide prayer. To arouse the church. To reach the masses by visitation, Gospel missions and conferences, Crusade Bands, wayside services in jails, halls, cottages, depots, etc. To enlist more women who shall preach the Gospel, and to train the workers.

Its methods are, first to secure a superintendent in each State, district, county and local union, through whose instrumentality local unions shall hold meetings with non-churchgoers, thus bringing to them a knowledge of the saving power of Christ.

Unfermented Wine.—This department aims to secure the use of unfermented wine at the Sacrament of the Lord's Supper; to awaken conviction in every mind that Christ did not make use of or bless intoxicating wine. Methods—Appeals to the ministry and

church officials; presenting petitions and resolutions to religious bodies; proving by the testimony of ancient and modern authorities and missionaries that unfermented wine was in use all through Bible times; securing the preaching of sermons against the use of intoxicating wine upon the Lord's table, as against any other sin, and the extensive circulation of literature upon this subject.

Proportionate and Systematic Giving.—This department seeks to create sentiment in favor of the title system or other methods of proportionate giving, as the most promising means of securing a pure and ample treasury for the Lord's work. The judicious and faithful distribution of systematic giving literature in all the families represented in the unions, also essays and addresses on the subject, and testimonies from those who have adopted the methods, constitute the plan of work.

Penal and Reformatory Work, including Police Station Work.—This department aims to carry gospel temperance to the inmates of prisons and jails; to cooperate in the work of Prisoners' Aid Association; to aid in establishing woman's reformatory prisons and industrial homes for the criminal classes; to secure the appointment of women on State boards of charities and the maintenance of matrons in all prisons and police stations where women are arrested or imprisoned. The gospel and police matron work is directly related to the W. C. T. U., and carried on by personal visitation, by letter and literature.

Work in Almshouses.—The aim of this department is to better the condition of the unfortunate and outcast by establishing libraries, regular Sabbath services, with frequent visitations in these institutions, hoping to bring additional brightness into the lives of those who are not able to obtain it for themselves, and, if possible, to cooperate with State boards of corrections and charities in their work of improving these institutions by bringing practical help along the lines of prevention and cure.

Securing Homes.—The object of this department is to secure a home for every homeless, unprotected child within our borders. These homes must be sought out with great care by our superintendents. In large towns and cities these children are often "at our doors," but we must seek out the waifs of remote and less populous districts. As individuals, members of unions, and church associations, we have become familiar with this work. But now we desire to extend it, to make it more efficient through the concerted action of our organization.

Cooperation with existing children's aid societies is recommended, rather than the forming of new ones, by our unions. These exist in every city and are glad to welcome us as coadjutors.

Work among Railroad Employees.—This department includes work among railroad men, telegraph operators, street-car men, policemen, express and hackmen, and train news agents, with their respective families, and aims to carry the Gospel and temperance, pledge to them all, and to organize among them gospel and temperance clubs, or "R. R. Unions." Cottage meetings, noon shop meetings, and personal work in connection with the mass-meetings is the line followed, with the distribution of literature, etc.

Among Soldiers and Sailors.—This department aims to reach the army and navy with gospel temperance work, also by means of the pledge and temperance literature, through cooperation with commandants and chaplains, by correspondence, articles in papers read by soldiers and sailors, and personal visitation. Also to enlist in this peaceful war all veterans, and to inculcate in the young a spirit of patriotism by securing their aid in the effort to place a flag on every school-house.

Among Lumbermen.—This department aims to carry gospel temperance, by means of the written and spoken word, to the great armies of men in the logging camps, destitute as they are of Christian teaching, and sure to fall an easy prey to the saloons unless forewarned and forearmed.

Among Miners.—This department aims to do for miners the same that is stated above relative to the lumbermen.

Sabbath Observance.—The aim of this department is to educate and arouse the public intellect and conscience, through leaflets, press articles, petitions and all other available means, to the religious, scientific and other reasons for Sabbath observance, especially raising a higher practical standard among professed Christians, and testing our own lives by the Word of God. Also to secure and maintain good Sabbath laws and usages, thus protecting all in their right to a civil rest day and fostering morality.

Mercy Department.—This department aims to develop in our young people the tenderest consideration toward all who are capable of pain, never needlessly inflicting it, and shielding the lower animals from both pain and danger so far as possible, also securing the enactment and enforcement of laws for this beneficent purpose.

Purity Department.—This department aims to exhibit the relations existing between the drink habit and the nameless habits, outrages and crimes which disgrace modern civilization; and especially to point out the brutalizing influence of malt liquors upon the social nature; this study to be conducted by means of mothers' meetings, leaflets, pamphlets, etc., cooperating with the White Cross Army and circulating its literature.

It seeks to establish a single code of morals, and to maintain the law of purity as equally binding upon men and women. It has in view a distinct effort to impress upon the minds of men and women, youth and maidens, the absolute demands of religion and physiology for purity in thought, word and deed.

It endeavors to secure legislation of a character calculated to protect the honor and purity of the young, and defend women and girls from the depravity of brutal men.

Purity in Literature and Art.—The germ thought of this department is "The Inner Mission"—the Bible as the highest expression of literature. Christ in art now rules the whole kingdom of art. It seeks the elevation of the press, and to this end scrutinizes the literature on news-stands, railroads and steamboats, library shelves, in mail matters, bill posters, shows, exhibitions, art galleries. Its methods are to appeal to Congress, legislators, councils, magistrates and courts for the enforcement of existing and creation of better laws; also lectures and literature to arouse public sentiment.

Parlor Meetings.—This department aims to interest the conservative social classes of society by the use of conservative social means. The meetings are held in homes, the audience gathered by invitation. The methods must vary to meet the varied character of social demands. Religious services, music, a brief address, conversational discussion, distribution of literature and circulation of autograph pledge-books are recommended. Gentlemen may be invited and honorary membership solicited. Refreshments add to the social character of the hour.

Social and Legal.

Flower Mission.—This department aims to graft our gospel work upon a beautiful form of philanthropy. Bouquets are to be tied with white ribbons and a Scripture verse or suggestion relative to temperance to be attached; literature to be circulated to accompany the flowers, and the total abstinence pledge offered at appropriate times.

State and County Fairs.—This department aims to bring temperance ideas and practices in contact with the people, at fairs and other great holiday gatherings, by means of a booth (suitably designated by mottoes, pictures and other decorations), where temperance drinks are dispensed and literature circulated; also to secure, if possible, favorable reference to the subject of temperance in public addresses, made either by those appointed by authorities of the fair, or if this be impracticable, presentation of the subject by our own speakers. This department protests against the sale of intoxicants on holiday occasions, and makes systematic effort to secure the enactment and enforcement of law to this end.

Legislation and Enforcement of Law.—This department aims to secure prohibition by constitutional and statutory law in every State and Territory, and to secure a prohibitory amendment to the National Constitution. Methods are varied, as the manifold work of the W. C. T. U. As all roads once led to Rome, so every purpose and plan points to the consummation defined under this all-embracing "aim." Specifically, petitions to legislative bodies, systematic efforts to enforce existing laws, and a course of study and reading for local unions are included under this department.

Franchise.—This department aims to aid the States that desire to utilize the school ballot for temperance purposes, if already conferred, or to secure in whole or in part the ballot for women as a weapon of protection to their homes from the liquor traffic and its attendant evils. Methods—circular letter with instructions, forms of petition, etc.; distribution and sale of appropriate literature; articles to the press; correspondence and public addresses.

Peace and International Arbitration.—This de-

partment aims to secure such training for the children in home, Sunday-school, public school, and Loyal Temperance Legion, as will make them despise physical combat, and will lift them to a plane where the weapons are arguments, parliamentary usage and law; all of these having above them the "sword of the Spirit," that weapon which is, above all others, worthy of reasonable and responsible beings.

The department also contemplates international arbitration as the method that shall universally replace war, and in this interest, literature will be circulated, public meetings addressed, petitions signed, and cooperation with the peace societies of this and other nations sought.

Christian Citizenship. *Object.*—To study the science of government and the rights and duties of citizens, to educate and influence voters, to combat the evils of organized society at the caucus, convention and ballot-box.

Standpoint.—This is Christian. *Christian* principles and ethical standards must be introduced and maintained in all the social and political relations of mankind.

Work.—Organize the local union for study and work. Organize the boys and girls for training. Organize the voters for direct action. Hold public meetings, circulate literature.

WOMAN'S RIGHTS.—(For an account of the woman suffrage movement in England and America, see articles **WOMAN SUFFRAGE IN ENGLAND**, by Helen Blackburn, and **WOMAN SUFFRAGE IN THE UNITED STATES**, by Rachel F. Avery. For woman's industrial position, see article **WOMAN'S WORK AND WAGES**. On other points, consult articles **AGE OF CONSENT**; **DIVORCE**; **FAMILY**; **HOUSEHOLD ECONOMIC ASSOCIATION**; **MARRIAGE**; **PROSTITUTION**; **SOCIAL PURITY**, etc.) We consider in this article, I. Woman's Political and Social History; II. Woman's Present Legal Status; III. The Arguments For and Against Woman Suffrage.

I. WOMAN'S POLITICAL AND SOCIAL HISTORY.

In prehistoric times and among barbarous tribes, women have occasionally been honored more than in later periods. The savage queen has sometimes been recognized as the superior of the savage king. Women in the legendary or heroic period of Greek history occupy a distinctly higher place than in the classic period. The cause for this is undoubtedly that early in the history of man customs have not yet hardened into social laws, and the position accorded to women depended, therefore, less upon social ideas and more upon the character of women. All history shows the same. Women of beauty or of ability, therefore, can secure a comparatively high place.

Primitive Times.

Around woman, too, more than around man develops the family and the home. (See **FAMILY**.) Yet if this be true, it is not so much that women are elevated as that men are debased. The first women, like the first men (see **SOCIOLOGY**), must be thought of as little more than slightly developed animals. If society first formed around the mother, force was the first law, and woman was usually looked upon as a slave, and later as a slave or a toy. She was early exposed to all those revulsions of feeling that follow the gratification, among rude men, of the animal passion. Marriage was regarded ere long, if not at first, as the ownership of women by men as their property. Chastity on the part of women was at first to large extent a property right. Men demanded it in their

property; to far less extent was it considered a merit in themselves. The unequal standard of morals for the two sexes is as old as human history. Women were often bought by their husbands from their fathers. In the Book of Genesis Jacob purchases Leah and Rachel, and pays their father for them in work. The payment of the husband to the father was in Greek called the *édva*, in Latin the *mundrum*. The modern wedding ring is usually supposed to be a relic of this sale. Among the Germanic tribes, where woman was more highly honored, the husband gave a gift, not to the father, but to the bride herself. It was usually given on the morning after the wedding night, and called the *morgengabe*. It is preserved in the modern jointure. In Greece the sale of the daughter by the father was early replaced by a gift from the father to the husband for the use of his wife; and later this dowry was secured to the wife in most cases of separation. All these monetary transactions show how far marriage has its basis in property considerations.

Greece was probably the first country to develop monogamy and to place women on an established basis of honor and of love. The parting of Hector and Andromache, the fidelity of Penelope to Ulysses, the love of Alcestis dying for her husband, the filial piety of Antigone, the heroic death of Polyxena, the resignation of Iphigenia to her father, who would sacrifice her life to fulfil his vow, the joyous love of Nausicaa, are pictures of Grecian womanhood in the early age, which, Lecky says, "Rome and Christendom, chivalry and modern civilization, have neither eclipsed nor transcended." Yet the heroes of that age had concubines. Female captives were little respected. Woman was always regarded as the inferior of man.

In the classic age of Greece, woman was legally more protected, was considered more capable of intellectual equality with man; yet morals were much deteriorated and a sensual conception of woman far more developed. The virtuous woman was secluded. In Xenophon's picture of the married life, the young wife is portrayed as an innocent child, petted and tutored by her husband. At a later stage, Plutarch conceives of husband and wife as equals; but usually the virtuous woman was under the tutelage first of her father, then of her husband; if widowed, of her sons. Marriage was regarded in civic light as the means of producing citizens. Protected somewhat by the law, the Greek wife was by custom fettered exclusively to household circles.

The Greek *hetæra*, or courtesan, was, on the contrary, free to develop mind and body, and became the intellectual companion of man. Statesmen like Pericles and philosophers like Socrates honored the *hetæra* in public and in private. Says Lecky (*History of European Morals*, vol. ii., chap. v.): "If we can imagine Ninon de l'Enclos at a time when the rank and splendor of Parisian society thronged her drawing-rooms, reckoning a Bossuet or a Fénelon among her followers—if we can imagine these prelates publicly advising her about the duties of her profession, and the means of attaching the affec-

tions of her lovers, we shall have conceived a relation scarcely more strange than that which existed between Socrates and the courtesan Theodota." Aspasia won the love of Pericles by her genius as well as by her beauty. The courtesan Leontium was among the followers of Epicurus. Socrates owned his deep obligation to the courtesan Deotima.

Courtezans were honored, too, in connection with religion. They were the voluptuous priestesses of Aphrodite. The form of Phryne, carved in gold, stood in the Temple of Apollo at Delphi. Schools of vice at Miletus, Tenedos, Lesbos, and Abydos were connected with the temples. The love of beauty in a climate where the eye could become acquainted with the nude in the gymnasia and the baths, the worship of life and the instruments of the propagation of life, tended to this result. In Pompeii a symbol of the male organ of generation seems commonly to have been stamped on bread as representing the sustainer of life. Nor must the sensuality of Greece and Rome be regarded as exceptional. (See PROSTITUTION.) Says Lecky (*idem*, chap. v.):

"There has arisen in society a figure which is certainly the most mournful and in some respects the most awful upon which the eye of the moralist can dwell. That unhappy being whose very name is a shame to speak; who counterfeits with a cold heart the transports of affection, and submits herself as the passive instrument of lust; who is scorned and insulted as the vilest of her sex, and doomed for the most part to disease and abject wretchedness and an early death, appears in every age as the perpetual symbol of the degradation and the sinfulness of man. Herself the supreme type of vice, she is ultimately the efficient guardian of virtue. But for her the unchallenged purity of countless happy homes would be polluted, and not a few who, in the pride of their untempted chastity, think of her with an indignant shudder would have known the agony of remorse and despair. In that one degraded and ignoble form are concentrated the passions that might have filled the world with shame. She remains, while creeds and civilizations rise and fall, the eternal priestess of humanity, blasted for the sins of the people."

In Rome, woman, except in the very earliest period, was given more legal rights than in Greece. Marriage was regarded in law and in social ideals as a contract between equals. This in the earliest period was overridden, it is true, by the **Rome.** terrible powers given to the father of the family (see FAMILY); but this was gradually modified, and the Roman and Stoic exaltation of the individual was extended to the wife. "*Ubi tu Caius, ego Caiâ,*" the Roman wife could say. This tendency to conceive of marriage as a contract between sovereign individuals led to easy divorce. The disintegration of marriage ties that set in is well known. (See FAMILY.) Seneca says that marriage was contracted to give piquancy to adultery. Friends exchanged wives. Under the empire the sensuality of the East was added to the vices of the West. In the East, alike in ancient Babylon, in Persian poets and Arabian Nights tales, the conception of woman is almost purely sensual. The Jewish conception was to an extent, tho only to an extent, an exception to this. The women of the Jewish Scriptures show strength rather than the beauty of family love. Miriam, Deborah, Jael, Jezebel, Athaliah, Esther, are heroines. Ruth almost alone

represents a pure idyllic life. But the institutions of the Mosaic code, the polygamy of early Jewish life, the symbolism of the Song of Songs, show the sensual basis of the Jewish conception of woman out of which she could arise only by heroic deeds. Lecky thinks the Jewish type of woman far inferior to those of Greek poetry or Roman history. We find, however, a distinct evolution. Polygamy seems to have disappeared after the purging sufferings of the Babylonish captivity. The pictures in the New Testament of Elizabeth, of Anna, and, above all, of Mary, even before the influence of Christianity, show the comparatively high and pure development of the Jewish woman in the days immediately before Christ.

The influence of Christianity on the legal and political status of woman has been much discussed. (See CHRISTIANITY AND SOCIAL REFORM; CHURCH AND SOCIAL REFORM.) Viewed from

the standpoint of modern ideas, the Pauline conception of woman is distinctly low. "Wives, submit yourselves unto your own husbands, as unto the Lord, for the husband is the head of the wife, even as Christ is the head of the Church, and He is the Saviour of the body. Therefore as the Church is subject unto Christ, so let the wives be to their own husbands in everything," so St. Paul writes to the Ephesians (chap. v. 22-24). Those who assert the low estimate of women held by St. Paul have undoubtedly no little basis for their view, even tho St. Paul immediately added, "Husbands, love your wives, even as Christ also loved the Church and gave Himself for it." Marriage also by the Church fathers, and, to some extent, even in the pages of the New Testament, is conceived of as at best a weakness, a legal concession to the flesh. Paul writes to the Corinthians that "it is good for a man not to touch a woman; nevertheless to avoid fornication, let every man have his own wife and every woman have her own husband" (1 Cor. vii. 1, 2). In the same letter he says: "The wife hath not power of her own body, but the husband; and likewise also the husband hath not power of his own body, but the wife." The extremes to which the early Church carried the praise of virginity and the identification of marriage with sin is well known. Jerome says that tho marriage may replenish the earth, virginity replenishes heaven (Westermarck's *History of Marriage*). (See FAMILY.)

Nevertheless, the ideas of the early Church must be compared not with our ideas, but with those of that day, and the purity of the Christian family and the honor paid to woman is as light itself compared with the darkness of the impurity of the pagan world.

Christ's teaching that evil consists in the impure heart rather than in the body, that he "who looketh on a woman to lust after her hath committed adultery with her already in his heart," indicates an almost infinite advance in moral elevation. The mere fact that marriage became the symbol of the espousals of Christ and His Church indicated and led to an elevation of the wedded life. "Concubina" is never written on a Christian grave. Says Origen:

"There is not a Christian community which has not been exempted from a thousand vices and a thousand passions" (*Contra Celsum*). (For the influence of Christianity on the Roman legislation in regard to woman, see CHRISTIANITY AND SOCIAL REFORM.) "Tutelage of women must be done away with," say Justinian's *Institutes*. Many laws were passed giving woman more legal rights and protection.

Coming to woman's position in the Middle Ages, it appears the result of the blending of many influences, the laws of the Roman Empire, the ideals of Christianity, the asceticism of the clergy, the traditions of Germanic tribes, the romanticism of chivalry, and the lust of warlike men. (See MIDDLE AGES; FAMILY; CHURCH AND SOCIAL REFORM; CHRISTIANITY AND SOCIAL REFORM.) The Germanic tribes honored woman, yet rather, as we have seen above, on the basis of savage equality than of legal status. Compared with the corruption of Rome, the purity of Germanic marriage struck Tacitus, and, through him and similar writers, has been much emphasized, but its purity did not begin to compare with that of early Christianity. Polygamy was allowed to princes; the wife was usually bought; the male adulterer, by some laws at least, was allowed simply to pay the injured husband or to provide him a new wife. (See CHRISTIANITY AND SOCIAL REFORM.)

The influence of the Church in the Middle Ages was twofold. The influence of monasticism and asceticism on the ordinary life of woman was almost wholly bad. To conceive of marriage as sin was to give it over to sin. The terrible reactions of asceticism and the corruption developed by monasticism (*q. v.*) are well known. (See MIDDLE AGES.) Nevertheless, the nunneries did enable some women to escape the violence of the times and develop saintly lives.

In connection with this was the development of Mariolatry. The worship of the Virgin has probably more connection with the romantic and partly sensuous ideas of medieval chivalry than all writers are willing to admit. Yet no one can question its influence in part for good. Says Lecky:

"It is also a striking illustration of the qualities which prove most attractive in women that one of whom we know nothing except her gentleness and her sorrow should have exercised a magnetic power upon the world incomparably greater than was exercised by the most majestic female patriots of paganism. Whatever may be thought of its theological propriety, there can be little doubt that the Catholic reverence for the Virgin has done much to elevate and purify the ideal of woman and to soften the manners of men. It has had an influence which the worship of the pagan goddesses could never possess, for these had been almost destitute of moral beauty, and especially of that kind of moral beauty which is peculiarly feminine. It supplied in a great measure the redeeming and ennobling element in that strange amalgam of religious, licentious, and military feeling which was formed around women in the age of chivalry, and which no succeeding change of habit or belief has wholly destroyed."

But the worship of the Virgin was an effect as well as a cause. Lecky admits this when he says: "The position that was gradually assigned to the Virgin as the female ideal, in the

belief and the devotion of Christendom, was a consecration or an expression of the new value that was attached to the feminine virtues." Whence chivalry came no man wholly knows. It had a deep root in sensuality. No one can read the romances of the Middle Ages, the poetry of the minnesingers or the troubadours, without realizing this. Its honoring of woman was in part borne of degrading views. Men cannot pay certain forms of respect to women without giving them, in their very adulation, the grossest insult. To praise a woman's weakness is to acknowledge it, and to show that one's ideal of womanhood is weak. To worship physical love is to confess to a low type of loving. The connection between chivalry and licentiousness is always close. Nevertheless there was another root. Woman in the Middle Ages stood for the softening of war and violence and strife. When the knight knelt before his lady, he rose to a nobler manhood, and chivalry honored the source of the higher life. The chivalry of the Middle Ages was far higher than the classic worship of the *hetære*; it was undoubtedly far lower than the less romantic love of women at the present time.

The effect of the Protestant Reformation on the social status of woman was undoubtedly good, tho not an unmixed good. Its greatest effect in this respect was to condemn celibacy, the false praise of virginity, and the condemnation of marriage. Second only to this was its effect in freeing woman from subjection to the confessor and the priest. The sanctity of married life, the inviolability of the home, are almost distinctively Protestant conceptions. Undoubtedly, with these enormous strides forward, certain evils came in. The tendency to secularize the marriage relation has to some extent tended also to commercialize it and to increase divorce (*q. v.*). However, of this secularizing and liberalizing tendency has come the modern movement toward woman's rights. It has, however, only developed in our own century. Milton, in his day, makes Eve say to Adam (*Paradise Lost*, Book IV.):

"God is the law, thou mine;
To know no more is woman's happiest knowledge and
her praise."

Even Rousseau says:

"Women are specially made to please men. . . . All their education should be relative to men. To please them, to be useful to them, to make themselves loved and honored by them, to bring them up when young, to take care of them when grown up, to counsel, to console them, to make their lives agreeable and pleasant—these in all ages have been the duties of women, and it is for these duties that they should be educated from infancy. . . . Being incapable of judging for themselves [as to religion], they ought to accept the decision of their fathers and their husbands like that of the Church" (*Emile*, ch. v.).

In 1797 Charles Fox said in a speech:

"It has never been suggested in all the theories and projects of the most absurd speculation, that it would be advisable to extend the elective suffrage to the female sex."

This brings us, however, to our own century, and we pass to consider:

II. WOMAN'S PRESENT LEGAL STATUS.

(a) IN THE UNITED STATES.

The brevity of this article prevents any attempt to give a full statement of the conditions prevailing for women under the laws of each State and Territory, no two of their codes being exactly alike; but the following statement has been compiled by Mrs. Rachel F. Avery for this encyclopædia from Jessie J. Cassidy's *Legal Status of Woman* (1897). Says Mrs. Avery:

"With the early ideas of woman as a chattel, it followed naturally that men making the laws should provide that whatever the woman possessed should also, with her person, become the property of her husband when she married. Slowly but surely this idea has had to give way to the realization of woman as a distinct creation, with individual rights of her own; we therefore find recorded in the laws and statutes and, in a few cases, in the constitutions of our States and Territories, a gradually increasing recognition of the wife's right to hold property after marriage. *Full control of property by the woman after marriage* exists in Arizona, Arkansas, California, Colorado, Connecticut, Delaware, District of Columbia, Georgia, Illinois, Indiana, Iowa, Kansas, Kentucky, Maine, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Montana, Nebraska, New Hampshire, New Jersey, New York, North Dakota, Ohio, Oregon, Oklahoma Territory, Pennsylvania, Rhode Island, South Carolina, Utah, Vermont, Virginia, Washington, West Virginia, Wisconsin and Wyoming. In Nevada and South Dakota the wife may have full control, provided a list of her property be filed with the County Recorder; but this demand of the law would put such control out of the hands of many women. The first year which gave such a right to a woman was 1844, and the last such change in her favor was made in 1895.

Partial control by the woman after marriage prevails in Alabama, Louisiana, Missouri, New Mexico, North Carolina and Tennessee.

Property is entirely in the hands of the husband in Florida, Idaho and Texas.

The Power to Will Property.—Since Connecticut set the example of giving this right to women, early in the century, all the other commonwealths have one by one followed; but this does not mean that a wife may will all her property away from the husband, no matter how unworthy he may have proven himself, unless she has legally separated herself from him. She has still no right to devise by will a dollar's worth of the earnings of the marriage copartnership, these being considered as a part of her husband's estate. In the matter of the recognition of the earning power of woman in marriage, it remains for the States where women are fully enfranchised to set an example in legislation. As things now stand, the hardest working wife, dying before her husband, dies penniless (unless having inherited money or earned it outside the home in some State where she has the right to her own wages), and unable to provide by will for aged parents or her children by a preceding marriage. The husband, on the other hand, dying before his wife has it in his power to so provide to the extent of quite a liberal proportion of their joint earnings, should it please him so to do, provided he does not will away from the wife her dower. It is no mere phrase, but a fact of law that the average wife is 'buried from the home of her husband,' for while he is alive she has no home of her very own.

A wife has right to her own wages in Alabama, Arkansas, Colorado, Connecticut, Delaware, District of Columbia, Florida, Illinois, Indiana, Iowa, Kansas, Kentucky, Maine, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Nebraska, New Hampshire, New Jersey, New Mexico, New York, Ohio, Pennsylvania, Rhode Island, South Carolina, Utah, Vermont, Washington, West Virginia, Wisconsin and Wyoming.

She has partial right to her own earnings in Arizona, California, Georgia, Idaho, Missouri, Montana, Nevada, North Carolina, North Dakota, Oklahoma Territory, Oregon, South Dakota, Tennessee and Virginia.

She has no control of her own earnings in Louisiana and Texas.

"In Pennsylvania the woman must present a petition under oath to the Court of Common Pleas that she intends to take advantage of the Act of 1872, giving her a right to her own wages, before she can really claim

them; this seems an unnecessary addition to the labor of earning them; but the climax of man's generosity to woman is surely reached in Nevada, where the Act of 1873, relating to wages of married women, states that 'her earnings are the wife's, if the husband has allowed her to appropriate them to her own use, and are deemed a gift from him to her.' Think of the privilege of being kindly permitted to 'appropriate' your own earnings, provided you would be careful to consider them 'a gift' from your husband!

"The right of married mothers to their children has been refused longer than any other personal right," says Cassidy in her 'Legal Status of Woman,' from which this article is compiled. Men have been willing to give the child born out of wedlock to its mother, but legal heirs they have wished to hold in their own power.

"Mothers and fathers are equal in power in Colorado, Kansas, Maine, Nebraska, New York, Pennsylvania and Rhode Island.

"In all the other States and in the Territories the mother is at a disadvantage, varying from the point of being simply ignored legally while the father is living, to the more crushing injustice of having no power to prevent the father from willing a way from her custody the youngest infant or even 'a child likely to be born.' It is sometimes claimed that such laws as this last mentioned (still holding in Minnesota and North Carolina) are dead letters, but this is not the case; they are dead only so long as no case arises under them, but put to the test, they are as stern realities as if they had been enacted but yesterday."

For other phases of woman's legal position see articles upon MARRIAGE AND DIVORCE; AGE OF CONSENT; WOMAN'S WORK AND WAGES, etc.

(b) IN GREAT BRITAIN.

In Great Britain there has been recently great advance in woman's legal status. Down to 1839, an English mother had no right to her own offspring. Her husband, even during her lifetime, could with immunity place his children under the control of his mistress, or wherever he would, and deny the mother all access to them. After that year a mother, not guilty of adultery, could be protected in her right to care for her children up to the age of seven and to have access to them to a later age. In 1873, on special application, a mother could gain the right to care for her children to the age of 16. All other legal powers were, however, vested in the father, and even after his death the mother was not the natural guardian of her own children. She was so recognized only by the law of 1886. The father may yet, however, appoint a guardian to act with the mother after his death. Up till 1857, a man who abandoned his wife could return to her, appropriate her earnings, and sell all she had acquired, and do this repeatedly. The Act of 1857, however, protected the earnings of a deserted wife, and the Act of 1886 secured her alimony from her husband. In all cases, however, except desertion, the husband had full power over the wife's earnings. He could be compelled to give her a bare maintenance, but otherwise he could spend her earnings in the brothel or where he would. Only by the law of 1870 were the wife's own earnings protected. All other property was, however, left wholly unprotected. By common law the wife possessed nothing. All property willed to her after marriage over £200 was her husband's. She could not sue or be sued, and could make no contract without the husband's consent. The courts of chancery somewhat modified this, till acts of 1882 and 1893 gave the wife ample protection. If a wife, however, dies intestate, all her property goes to her husband. If the husband dies intestate, and has no children, his wife only receives £500 more than one half his property, unless it does not exceed £500, the rest going to his nearest blood relations. In the divorce court, too, a husband need only prove adultery. The wife must prove adultery and some aggravation, like cruelty or desertion.

(c) ON THE CONTINENT.

On the continent less advance has been made, though in Russia woman's property has been from the earliest times perfectly secure and unaffected by marriage. In Switzerland, the custom of treating women as perpetual minors only wholly disappeared in 1881. Women's earnings were protected in Sweden in 1884 and in Denmark in 1880. The property of married women was protected in Norway in 1888. New civil codes in Germany and Italy indicate advance.

Of Germany, Mrs. Bertrand Russell writes in *The Nineteenth Century* for September, 1896:

"Associations founded for political objects may not have women, scholars, or apprentices as members, nor may women, scholars, or apprentices be present at any meetings of such associations." So runs the Prussian Coalition law, and the laws of Bavaria, Brunswick, and some of the smaller States impose the same limitations on women. These laws explain in a large measure why there is not in Germany any strong and well-organized woman movement. But besides the political there is also a social cause. The incomes of the professional and mercantile classes are much smaller than in England, and German women are therefore obliged to devote a great part of their time and thought to household work.

If unmarried girls of the middle class have revolted to some extent, the cause has been mainly economic. Self-support rather than self-development was their aim, and tho it was a narrow aim it had in it the germ of a larger movement. Their first and most important question was that of higher education. German women could not attend the universities, tho, absurdly enough, foreign women were admitted, and they could not study or practice law or medicine. At last women are permitted to practice medicine, tho the training and degree for it must still be obtained abroad. German women may also now attend lectures in most of the German universities, but without being allowed to matriculate, and generally on the sufferance of the professors. In the course of all this agitation, for even these few concessions have not been won without very great efforts, the women of the middle classes began to realize that no real improvement could be effected in their position without some change of the laws. A woman is entirely under the guardianship of her husband, and her property and earnings are wholly at his disposal. After her children are four years old, she only has as much control over them as the law allows to those grossly immoral or inebriate fathers whose control has had to be supplemented by legally appointed guardians. And after the death of the father his will or the law may appoint a third person as guardian, who will have equal control with the mother over the children. If the mother marries again, she loses all control over children. . . . The future of the woman movement in Germany undoubtedly lies with the Social Democratic party, the only strong political party in the world that demands the full equality of the sexes."

Of France, Jeanne E. Schmake says, in *The Forum* for September, 1896 (condensed):

"The question of religious differences cannot be passed over when treating of the women's question in France, because of the stress laid upon it by the women themselves. Whatever may be the religious attitude of political France, the majority of French women are Catholics; whereas up to January, 1893, the women's movement in Paris was ostensibly hostile to Catholicism, and the tenets of its leaders extreme Republicanism. Among the more thoughtful, it came to be pretty generally admitted that there was room for some association of no special political or religious tendency—simply groups of men and women united on one point—viz., the amendment of laws concerning women, with perhaps no other point of contact of opinion. A powerful association was gradually forming. Among its earliest members were the leading journalists of Paris, deputies and senators of every shade of opinion, celebrated scientists and jurists, and a few of the best-known female authors, among whom was Madame Adam, now for the first time taking part in the women's movement. Then, as if to give special significance to the new mode of action, a few women of the old French aristocracy, notably the Duchesse d'Uzès, joined the movement. With such a staff the actual work was comparatively easy, and I willingly consented to direct the young association; and we started *l'Avant Courrière* on January 30, 1893.

"Taking into consideration that the civil code is the one great obstacle to the emancipation of women in France, we decided to attack it. We were not long in coming to the conclusion that, financial freedom being the root of all liberty, we must first set to work to obtain for married women the right to their own earnings. . . .

Germany.

France.

"On February 27, 1896, the bill conferring upon married women the power of free disposition of their earnings passed the Chamber of Deputies without opposition—the first time in French history that a woman's rights movement has received support from the government. It is difficult to predict what reception we shall get in the Senate, yet even there we have many friends, and therefore have the right to be hopeful. This very important modification of the French marriage laws affects about 4,500,000 workwomen, not to speak of authors, musicians, painters, actresses, teachers, shop-assistants, and domestic servants—in all about 6,000,000 women-workers, who, if married, have, as the law now stands, no right to their own earnings, if that right has not been stipulated for by a legal agreement made at the time of their marriage."

III. ARGUMENTS FOR AND AGAINST WOMAN SUFFRAGE.

(a) ARGUMENTS FOR IT.

The arguments for woman suffrage are based partly upon the asserted natural rights of woman, partly upon the need of woman's influence in politics both to protect her own sex and to purify the increasingly important realm of political action; thirdly, upon the good results of woman suffrage where already tried. Upon the first point, says a leaflet published by the American Woman Suffrage Association :

"The basic argument for woman suffrage is that women have as clear a title to the ballot as men have. It is urged that women are governed, but without their consent. From the Declaration of Independence is quoted: 'Governments derive their just powers from the consent of the governed.' In the support of the claim that the suffrage is a right of both sexes alike, the late George William Curtis said, in an address before the New York State Constitutional Convention of 1867 :

"The rights which they [the fathers of the republic] declared to be inalienable are what are usually called natural as distinguished from political rights, but they are not limited by sex. A woman has the same right to her life, liberty and property that a man has, and she has consequently the same right to an equality of protection that he has; and this, as I understand it, is what is meant by the phrase, 'the right of suffrage.' If I have a natural right to my life and liberty, I have the same right to everything that protects that life and liberty which any other man enjoys. I ask, the same for every woman in this State.

"Our fathers answered the question of the best and surest protection of natural right by their famous phrase, 'the consent of the governed.' That is to say, since every man is born with equal rights, he is entitled to an equal protection of them with all other men; and, since government is that protection, right reason and experience alike demand that every person shall have a voice in the government upon perfectly equal and practicable terms—that is, upon terms which are not necessarily insurmountable by any part of the people.

"I deny that the people of the State of New York can rightfully—that is, according to right reason and the principles of this government derived from it, permanently exclude any class of persons or any person whatever from a voice in the government, unless it can be clearly established that their participation in political power would be dangerous to the State."

Upon the second point, the need for woman suffrage, it is claimed that women cannot be adequately protected while men alone make the laws, and the denial of the franchise to women is denounced as a stigma degrading her to the same category with idiots, lunatics, and criminals. It is urged that woman's mind would be broadened and elevated by a study of public questions, and, further, that voting is the quietest, easiest, most dignified, and least conspicuous way of influencing public affairs. It is asserted that women need the ballot to protect their business interests and to acquire social

and personal rights that are now denied them. It is claimed that woman suffrage would increase the strength of the home element in politics, secure the election of better men to office, and introduce higher moral standards into government.

(For evidence of the need of woman to protect her sex in legislation, see Sec. 2 of this article, on "Woman's Present Legal Status." See also article AGE OF CONSENT.)

Concerning the results of woman suffrage, Miss Alice Stone Blackwell, editor of the *Woman's Journal* of Boston, writes the *Voice* of November 9, 1893, as follows :

"In England, Mr. Gladstone is on record as saying the women have exercised municipal suffrage "without detriment and with great advantage." Lady Randolph Churchill and the band of highly conservative English women who published a "remonstrance" against granting parliamentary suffrage to women, a few years ago, were careful to say that they had no objection to municipal suffrage, and even thought its responsibilities had exerted a beneficial effect on the character of women.

"In the States where women have school suffrage only, the vote of women has generally been small, as the vote of men is always small wherever the school committee are chosen at a separate election; but the women who have voted have been almost without exception of the intelligent and respectable class.

"The statement has been widely circulated that the vote of the Boston women for the school board is falling off. At the last school election in Boston, 4000 more women voted than at the previous election; and the women's vote for the past five years has averaged more than six times what it averaged for the five years previous."

"In Wyoming, full suffrage was extended to women by the Legislature of that Territory in 1869. The results proved so satisfactory that the law was continued upon the statute book for 20 years. In 1889, the constitutional convention elected to frame a constitution for the new State of Wyoming and embodied a woman suffrage clause in the constitution by a five-sixths vote. The constitution containing this woman suffrage clause was submitted to the people (the people in this case meaning both men and women), and was ratified by a very large majority. Wyoming was admitted to the Union with this clause in its constitution by a vote of 132 to 119 in the House of Representatives and a vote of 29 to 18 in the Senate. The House of the Wyoming Legislature of 1893, just before adjournment, passed by a unanimous vote the following concurrent resolution :

"Be it resolved by the Second Legislature of the State of Wyoming :

"That the possession and exercise of suffrage by the women in Wyoming for the past quarter of a century has wrought no harm and has done great good in many ways; that it has largely aided in banishing crime, pauperism, and vice from this State, and that without any violent and oppressive legislation; that it has secured peaceful and orderly elections, good government, and a remarkable degree of civilization and public order; and we point with pride to the facts that after nearly 25 years of woman suffrage not one county in Wyoming has a poorhouse, that our jails are almost empty, and crime, except that committed by strangers in the State, is almost unknown; and as the result of experience we urge every civilized community on earth to enfranchise its women without delay.

"Resolved, That an authenticated copy of these resolutions be forwarded by the governor of the State to the Legislature of every State and Territory in this country, and to every legislative body in the world; and that we request the press throughout the civilized world to call the attention of their readers to these resolutions."

"Every governor of Wyoming for more than 20 years has testified that much good has resulted from woman suffrage."

More recent experience bears out, according to the woman suffrage believers, these good results. The first legislature elected in Colorado after the granting of woman suffrage raised the age of consent from 14 to 18, and gave a

married woman an equal voice with her husband in regard to children. At the last election in Denver, the women are credited with defeating the saloon element. A correspondent of the *Congregationalist* writes from Sydney, South Australia, under date of May 9, 1896, that it is generally conceded there that woman suffrage has made parliamentary elections more orderly. It is true that nowhere has woman suffrage introduced startling changes, but this is neither to be expected nor desired.

OBJECTIONS TO WOMAN SUFFRAGE ANSWERED.

The main objections to woman suffrage are that (1) women are physically disqualified from participation in the actual work of government; that they are unfitted for service in the fire and police departments and for the work of paving and lighting streets, building roads, and other forms of public property; (2) home duties would prevent woman, even if she were physically able, from participating in the administration of law, chiefly in such capacities as police officer and juror; (3) woman suffrage would divide the husband and wife and leave the family no longer a social unit; (4) women are now virtually represented at the polls and in government.

To the first objection cited above the answer is, that what the voter needs is not personal knowledge of how to build sewers, construct aqueducts, run law courts, etc., but sufficient judgment and common sense to elect honest men to office to attend to these things. Women share in the results of these material things of government, and if the work has been badly performed, women suffer quite as much as the men, and therefore are entitled to a voice in the choosing of men who shall control these matters.

To the second objection answer is made that a woman need not cease to be domestic because she is also patriotic and takes an intelligent interest in public questions. Such a patriotic woman will be a more rational companion for her husband and a broader-minded mother for her children. Women owe the men of their families mental and spiritual companionship. In none of the States is the ability to bear arms or serve as juror or police officer regarded as a qualification for the suffrage. Not all male citizens, but only able-bodied male citizens, are subject to police duty. Women at home have as much time for voting as busy men, and they have more time for thought.

To the third objection, reply is made that in matters of opinion and belief the unit must necessarily be the individual, not the family: The family ought to be a unit in affection, but it cannot always be a unit in opinion, and it rarely is so.

There is no country where the franchise is given to every head of a family and to no one else. No matter how many men over 21 years of age there may be in a household, each of them has a vote to represent his opinion. With the family as the suffrage unit, a widower who had lost his wife and children would be debarred from voting, because he is no longer the head of a family.

To the fifth objection, that women are represented already, the reply is, men cannot repre-

sent women, because they are unlike women. Women as a class have tasks, interests and occupations which they alone can adequately represent. Men specially represent material interests; women will specially represent the interests of the home. The laws relating to the liquor traffic and to social purity, and the laws giving the husband power of disposing of his wife's property or children without her consent, and many other laws that might be cited, are evidence that the views of women are not represented in government. James Otis, one of the earliest American orators and a contemporary of Patrick Henry, said: "No such phrase as 'virtual representation' was ever known in law or constitution. It is altogether a subtlety and an illusion, wholly unfounded and absurd."

Other objections are: (1) politics are necessarily corrupting; (2) women would vote as their husbands or fathers do; (3) the best women will not vote; (4) most women do not want to vote; (5) woman suffrage would only double the vote without changing results; (6) woman suffrage would diminish respect for women.

The answers generally made to these objections are: (1) "If politics are necessarily corrupting," why not advise good men to quit voting? (2) Many women have no husbands and no living fathers. If they have and vote as these men do, there will be no quarrel; if they vote differently, then this objection falls to the ground. (3) Women who *will not* vote are not the best women. Women who are really conscientious will not shirk their duties when the time comes. (4) There is frequently an election toward which a majority of the voters may be said to be indifferent. It has been shown by statistics that, except in years of presidential election, a majority of men in Massachusetts do not vote. (5) But the quality of the voters changes the quality of politics. A political party of men and women will not be the same as a party of men alone. (6) Voting is power. Power always commands respect. Women armed with the ballot will be stronger and more respected than ever before.

THE ARGUMENTS AGAINST WOMAN SUFFRAGE.

The arguments against woman suffrage are as various as those claimed for it. The main argument is that influence and power, even political influence and power, are and ought to be of more kinds than one. Voting is not the only means of political and social power. Quiet home influences are greater powers, even in politics, and in this realm woman is supreme. Men rule the outer world, women the inner. To drag women into the public arena is to weaken her influence at home and to violate that law of sex which nature has made, not man.

That women do not need to vote in order to secure proper legislation can be seen by the fact that without the ballot, laws almost revolutionary have been enacted in favor of women in almost all countries within the last few years. In England and in many American States, women are legally protected as much as men. Some injustices doubtless remain, but these are abated by instances where women are more pro-

tected than men. Says Dr. Goldwin Smith, in *Essays on Questions of the Day* :

"The law regarding the property of married women has been so far reformed in the interests of the wife, that, instead of being unduly favorable to the husband, it seems rather inspired by mistrust of him. The practice is still more so. It has become the custom to tie up a woman's property on marriage so that she shall not be able, even if she is so inclined, to make provision for her husband, in case he survives her, in old age, and save him from the necessity of receiving alms from his own children.

"That the administration of the law has been unfavorable to women few will contend. In jury cases, at least, the difficulty is not for women to get justice against men, but for men to get justice against women."

Says Francis M. Scott, of New York : "The law of this State not only does not discriminate against woman in any respect, save that of voting, but actually affords to her many special privileges and immunities not enjoyed by men."

Undoubtedly laws could be improved for both men and women ; but all cannot be done in a day, and the fact, which no one can deny, that enormous progress has recently been made in the legal status of women without woman suffrage shows that it is *not* necessary to such progress. Nor does woman suffrage necessarily bring great improvement. Even its friends do not claim that it has accomplished much. Says a tract, *Woman Suffrage Tested by its Fruits*, published by the Massachusetts Association Opposed to the Extension of Suffrage to Woman :

"In Wyoming, full suffrage was given to women in 1869, and has been exercised by them ever since, at first under the territorial and later under the State form of government.

"Wyoming enjoys the distinction of legalizing gambling. Licenses are granted for gambling just as they are for liquor-selling, tho at a higher rate.

"There is another section of the Wyoming statutes in which we fail to recognize the gentle and humanizing influence of women. It is Section 875, and defines 'excusable homicide' thus : 'When committed by accident or misfortune in the heat of passion upon any sudden or sufficient provocation, or upon a sudden combat ; provided that no undue advantage is taken, nor any dangerous weapon used, and that the killing is not done in a cruel or unusual manner.' There may be other States which pronounce killing 'excusable' when done in 'the heat of passion,' provided it is not attended by unusual cruelty, but we do not recall them."

Of Colorado, a writer in *The Outlook* for March 20, 1897, says woman suffrage has not purified politics ; that the laws of the State as regards social purity and the rights of married women are not yet abreast of some of the Eastern States, while Wyoming is far behind Colorado.

The bad results of women's entry into the public arena are not so easily shown, because they consist mainly in the weakening of the home life and the quiet influence of women. But though they cannot be shown, they may be, and many believe that they are most marked and most threatening.

Feeling that there is a profound law of nature which enthrones woman in the home as men in political life, most women do not want the suffrage. Says the tract, *Tested by its Fruits* :

"How small is the proportion of women who really wish the ballot may be inferred from the 'referendum' upon the question of municipal suffrage for women, taken in Massachusetts in 1895. The opportunity was given to women at that election, without any expense, or any trouble beyond that of registering and voting,

to say whether they wanted municipal suffrage. Out of about 575,000 women entitled to vote, only 22,204 expressed a desire for the ballot. In Massachusetts, therefore, where the suffrage agitation has been as active as anywhere in the Union, less than 4 per cent. of the women want to vote. Assuming that this ratio holds generally, the suffrage proposition is that the ballot shall be forced upon the 96 per cent. of indifferent or reluctant women, because the 4 per cent. wish it."

Victoria Woodhull Martin, in the *Humanitarian* for July, 1896, says upon this point :

"In England, while other aspects of the woman's movement have gained ground, this (the suffrage phase) has moved slowly. Little has been achieved beyond a monster petition ; despite the platitudes of vote-catching ministers, the bill was relinquished in the last Parliament amid ribald laughter, and this session it has been dropped with a silence which is even more contemptuous."

Says Heloise Jamison, in the *Woman's Journal* for May, 1894 :

"Woman's place is in the forefront of life, that of the family and of the nation.

"Woman's chance of saving, elevating, caring for them lies in staying with them behind the barrier that love has raised. Her chance of protecting herself and man is to go with him to the edge of battle, pray for him in the needs-must of public duty, be the incentive for his return, and the reward of his hard endeavor.

"The destiny of the race is in her hands. God and man have placed it there, and it is in no spirit of self-praise or gratulation that she must carry on what is, after all these ages, but just begun. Every power in her must awake ; she will decide what public work is consistent with this final duty and what is not. Chivalry is no myth of the Middle Ages, but a truth of the century about to dawn. The names of mother, wife, sister must not become the football of sentiment-mongers or of mistaken realists in thought. If the ballot would be a hindrance, we must have none of it."

WOMAN SUFFRAGE IN ENGLAND.

—The woman suffrage movement in England is a natural outgrowth from the great Reform Act of 1832, which, by admitting £10 householders to vote, gave a wide extension to the electorate in a popular direction. But the extension applied to men only ; the act excluded women from all share in its provisions by restricting the new franchises to "male persons."

This was the first time that the word "male" had been used in the electoral law of England ; hitherto the words used had always been of a generic character—"persons," "freeholders," etc. Yet at the very time Parliament thus deliberately excluded them from this right of citizenship, numbers of women were taking a keen interest in the great public questions of the time. The long struggle over the Reform Bill had called out the enthusiasm of the sisters, wives, and mothers, as well as of the brothers, husbands, and fathers of the land. The interest women were thus learning to take in public questions was still further developed by the agitation for the repeal of the Corn Laws.

An article in the *Westminster Review* from the pen of Mrs. John Stuart Mill in 1851, and a pamphlet on the *Right of Women to the Po-*

litical Franchise, by "Justitia," in 1855, were among the early indications that a strong feeling was gradually growing up among thoughtful people against the exclusion of women from the franchise—a feeling that only waited an opportunity to take definite form of expression. That opportunity came when the return of Mr. John Stuart Mill, as member for Westminster in 1865, gave the women's cause a champion in the House of Commons just at the very time when a further extension of household suffrage was in prospect.

Three thoughtful women already engaged in promoting the employment and higher education of women—Miss Jessie Boucherett (who in 1859 had founded the Society for Employment of Women), Miss Barbara Leigh-Smith, or, as she had then become, Mrs. Bodichon, and Miss Emily Davies (the future founders of Girton College)—consulted Mr. John Stuart Mill. He said he would be glad to present a petition if it were signed by 100 women; he would not like to present one with less than 100 names. They set to work and procured the signatures of 1499 women to a petition of which the terms were as follows:

"That it having been expressly laid down by high authorities that the possession of property in this country carries with it the right to vote in the election of representatives in Parliament, it is an evident anomaly that some holders of property are allowed to use this right, while others, forming no less a constituent part of the nation, and equally qualified by law to hold property, are not able to exercise this privilege. "That the participation of women in the government is consistent with the principles of the British constitution, inasmuch as women in these islands have always been held capable of sovereignty, and women are eligible for various public offices.

"Your petitioners therefore humbly pray your honorable house to consider the expediency of providing for the representation of all householders, without distinction of sex, who possess such property or rental qualification as your honorable house may determine."

The petition was presented by Mr. Mill in May, 1866. In the autumn of that year a paper was read by Mrs. Bodichon at the Social Science Congress in Manchester, on reasons for the enfranchisement of women. This paper attracted considerable attention to the subject, and its immediate result was the formation of a Woman Suffrage Committee in Manchester, and the introduction of Miss Lydia Becker to the movement with which henceforth her life became identified. As honorable secretary of the Manchester Committee, she threw all her great powers of mind into the work.

On May 20th, 1867, Mr. Mill introduced his amendment to the representation of the People's Bill to leave out the word *man* and insert *person*. The amendment was rejected by 106 to 83.

In the autumn of 1868 a general election took place, and constitutional lawyers like Mr. Chisholm Anstey having given it as their opinion that women who held qualifications under the early franchises in force before the Act of 1832 were legally entitled to vote, 5000 women in Manchester and others in various places applied to have their names on the register. The revising barristers were uncertain; some allowed, some disallowed the claim; a test case* was

brought before the Court of Common Pleas and argued before Lord Chief Justice Bovill; judgment was given against the claim on the ground that it was contrary to usage for women to vote.

After this decision, the movement became definitely organized, and a band of earnest women, some of whom have passed away and some continue still in the work, set themselves resolutely to the task.

The next important step was the introduction in 1870 of the "Bill to Remove the Electoral Disabilities of Women," by Mr. John Bright, M.P. The bill, which consisted of one clause, was as follows:

"That in all acts relating to the qualification or registration of voters, or persons entitled or claiming to be registered and to vote in the election of members of Parliament, wherever words occur which import the masculine gender, the same shall be held to include females, for all purposes connected with and having reference to the right to be registered as voters, and to vote in such election, any law or usage to the contrary notwithstanding."

The second reading was carried on May 4 by 124 votes to 91; but when it came into committee on the 12th, the opponents rallied in force and cast it out by 220 votes against to 94 in favor.

Again and again a bill was introduced, again and again debates took place in the House of Commons, with varying results.

In 1879 the procedure was varied by the introduction of a resolution in place of a bill. The resolution, which was moved by Mr. Leonard Courtney, was in the following terms:

"That in the opinion of this house it is injurious to the best interests of the country that women, who are entitled to vote in municipal, parochial, and school-board elections, when possessed of the statutory qualifications, should be disabled from voting in parliamentary elections, altho possessed of the statutory qualifications, and that it is expedient that this disability be forthwith repealed."

In the autumn of 1879 the Social Science Congress again met in Manchester, when Miss Becker read a paper on the *Progress of the Enfranchisement of Women*, in which she gave a sketch of the progress of the movement since 1866, and noted that during that period there had been presented to the House of Commons 9563 petitions in favor of the bill, with upward of 2,958,848 signatures, and that between 1300 and 1400 public meetings had been held, being an average of above two meetings per week during the last 13 years.

In 1880 anticipation was now becoming general of a new reform bill which should extend to the agricultural laborer in the counties the same household suffrage which had been extended to dwellers in boroughs by the Act of 1867, and the workers for woman suffrage hoped that this bill would bring them the fitting opportunity foreshadowed by the chancellor of the exchequer.

Mass meetings of women now became the most prominent feature of the work, and a series of magnificent meetings, when the largest halls of the largest towns overflowed with thousands of women, mark the work of the next three years.

At last the long-expected Reform Bill was introduced in 1884. Mr. William Woodall moved

* *Charlton vs. Lings.*

a new clause for the inclusion of women, but was met by determined resistance on the part of the Government, Mr. Gladstone stating in the most emphatic manner that the Government would decline all further responsibility for the Franchise Bill if the clause was adopted. The division list showed 271 against to 135 in favor.

A brighter prospect arose for a time in 1886, when the Parliamentary Franchise Extension to Women Bill actually passed a second reading; but Parliament was dissolved before the bill reached the stage of going into committee. In the general election which followed, for the first time a clear majority of the members elected pronounced themselves, at the time of their election, in favor of the principle of woman suffrage.

Yet for five successive sessions the pressure of public business precluded the question coming forward.

It was not until 1892 that the parliamentary leaders obtained a day (April 27) for a debate, when the Rt. Hon. A. J. Balfour concluded his speech with the following words:

"You will give a vote to a man who contributes nothing to taxation but what he pays on his beer, while you refuse enfranchisement to a woman because she is a woman, whatever her contribution to the State may be. She has sufficient ability to look after lighting and paving, but is not so fitted to look after the interests of the empire as a man who cannot point out on the map the parts of the world of which that empire is composed. I think from all I can hear that this bill is not likely to be successful on this occasion; but, depend upon it, if any further alteration of the franchise is brought forward as a practical measure, this question will again arise, menacing and ripe for solution, and it will not be possible for this house to set it aside as a mere speculative plan advocated by a body of faddists. Then you will have to deal with the problem of woman suffrage, and to deal with it in a complete fashion."

The opponents of the measure made unusual efforts to prevent its passage. Mr. Gladstone wrote a letter to Mr. Samuel Smith, M.P., which was widely circulated in pamphlet form, urging members to vote against it; yet it was only lost by the narrow majority of 23.

Other efforts have met similar fates in later years. But the advocates of the measure are by no means daunted, for they see unmistakable indications of the growth of opinion throughout the country, especially as seen in the readiness to sign the appeal from women in favor of woman suffrage which was circulated throughout the country in the winter of 1893-94 and ensuing spring. This appeal received 248,000 signatures of women of all ranks, parties, and occupations, and furnishes evidence of the continued growth of the movement which will be brought before the attention of members of Parliament whenever there is again prospect of a debate in the House of Commons.

HELEN BLACKBURN.

LOCAL FRANCHISES EXERCISED BY WOMEN IN GREAT BRITAIN.

Municipal.—The Municipal Corporations Act of 1835 restricted the franchise for town councils elections in England and Wales to male persons. The Municipal Corporations Act of 1869 removed the restriction. The Scotch Municipal Corporations Act of 1882 extended the report to women in Scotland.

School Board.—The Education Act of 1870, by which school boards were created, gave women precisely the same rights as men, both as regards electing and being elected.

County Councils.—The Local Government Acts of 1888 and 1889, creating county councils in England and Scotland, gave women the right of voting. They are not, however, eligible for election.

Poor Law Guardian Vestries.—These old parochial bodies, in which women rate-payers could vote and be elected, have all been changed by the Local Government Act of 1894, which has vested their duties in parish and district councils.

Parish and District Councils.—The first elections for these new bodies were held in December (1894). Women can elect and be elected, and for the first time married women were declared qualified to vote, provided they possess a qualification separate from their husbands.

WOMAN SUFFRAGE IN THE UNITED STATES.

—The year 1848 is to the history of the struggle for woman's political rights what 1776 is to the story of the American Revolution. So strongly did the men and women who inaugurated the struggle for "woman's rights" feel this analogy that at the first convention held for this purpose they used the Declaration of Independence as the model and framework of their own declaration of principles.

But no great movement comes unprepared for or unheralded, and the Woman's Rights Convention of 1848 had had its John the Baptists crying in the wilderness of prejudice and injustice.

In 1790 Mary Wollstonecraft's *Vindication of the Rights of Women*, published in London, attracted attention from liberal thinkers. Harriet Martineau, by her numerous writings upon political economy, demonstrated practically woman's ability to enter the realm of politics. As early as 1820 Frances Wright, of Scotland, visited this country, and in 1828 lectured in **Beginnings**, many places, striving to arouse the people to the danger threatening from the attempt to unite Church and State. All her influence was toward the recognition of woman equally with man in national affairs. Ernestine L. Rose, a brilliant and beautiful Polish woman, worked earnestly in this same direction.

It would be impossible to even mention here the host of women who, in the first half of this century, bore witness to their faith in the powers of their own sex to fill a wider "sphere" than the one appointed to them by the men of their day and generation. Emma Willard, in education; Elizabeth Blackwell, Clemence Lozier, Ann Preston, Hannah Longshore, Marie Zakrzewski, and Mary Putnam Jacobi, in medicine; Sarah and Angelina Grimke, Lydia Maria Child, Abby Kelley, Sarah Pugh, and Lucretia Mott, through their participation in the anti-slavery struggle; Margaret Fuller, in her literary work; Antoinette L. Brown, in the ministry; Susan B. Anthony, in the temperance work; Lucy Stone, at Oberlin, and in 1847 from the pulpit of her brother's church at Brookfield, Mass.—these all stood as pioneers making ready the way for the response to the call for the convention which made the first organized demand for "equality of rights for woman, social, religious, and political."

One other influence, and perhaps the greatest of all, leading directly to the calling of the Seneca Falls Convention, cannot be omitted here. This was the exclusion from the World's Anti-Slavery Convention, held in London in

1840, of the women sent there as delegates. A number of anti slavery societies in this country elected women to represent them in the deliberations of that body; the English members were unprepared for this, and regarded it as an innovation not to be endured; a most exciting discussion filled the first day of the convention. Wendell Phillips, George Braburn, also of Massachusetts, the venerable George Thompson, and Henry B. Stanton, stood as the advocates of the rights of the women as delegates. The clergymen were, as a body, bitterly opposed to their admission. By an overwhelming majority, the World's (?) Anti Slavery Convention refused to accept the women coming from Pennsylvania and Massachusetts fully credentialed as delegates, among whom were Lucretia Mott, Abby Kimber, Ann Green Phillips, Abby Southwick Sarah Pugh, and Mary Grew. William Lloyd Garrison, who, owing to delay at sea, arrived too late to take part in the discussion of the woman question in the convention, declined to take his seat as a delegate in a body which had refused the women, and sat with them in the gallery, a silent spectator during the ten days' discussion of a subject of such deep interest to him as the freedom of the slaves. He should be honored by every self respecting woman for this testimony in her behalf. Nathaniel P. Rogers, editor of the *Herald of Freedom*, of Concord, N. H., approved of Mr. Garrison's attitude, and decided to decline his seat in the convention; so the women delegates had two American men who felt strongly enough this illogical and unjust discrimination against sex to sit with the disfranchised women throughout the convention.

Elizabeth Cady Stanton, who had accompanied her husband, Henry B. Stanton, to London for the convention, in conversation with Lucretia Mott about the iniquitous attitude of the assembly on the woman question, decided that men needed educating on this subject as much as upon the freedom of the black slaves, and they agreed that later they would have a convention to discuss the position and rights of women. This was the seed from which grew the meeting of which the following is the call, which appeared in the *Seneca County Courier* of July 14, 1843:

"*Woman's Rights Convention.*—A convention to discuss the social, civil, and religious condition and rights of woman will be held in the Wesleyan Chapel, at Seneca Falls, New York, on Wednesday and Thursday, July 19, 20, current, commencing at 10 o'clock A. M. During the first day the meeting will be exclusively for women, who are earnestly invited to attend. The public generally are invited to be present on the second day, when Lucretia Mott, of Philadelphia, and other ladies and gentlemen will address the convention."

This call was without signatures; it was issued by Lucretia Mott, Martha C. Wright (her sister), Elizabeth Cady Stanton, and Mary Ann McClintock. Altho not invited to the first day's sessions, men came, and in such numbers as made it impossible to exclude them. It was therefore decided to have a man preside, and James Mott took the chair. After a number of addresses, the new declaration of independence, entitled a Declaration of Sentiments, was presented, and, after discussion and slight

amendment, accepted. It followed exactly the form of the Declaration of 1776, substituting the words "all men" for "King George." As the original document related eighteen grievances, so that of the women contained exactly that number. Let me quote some of these:

"The history of mankind is a history of repeated injuries and usurpations on the part of man toward woman, having in direct object the establishment of an absolute tyranny over her. To prove this, let facts be submitted to a candid world.

"He has never permitted her to exercise her inalienable right to the elective franchise.

"He has compelled her to submit to laws in the formation of which she has had no voice.

"He has withheld from her rights which are given to the most ignorant and degraded men—both natives and foreigners.

"Having deprived her of this first right of a citizen, the elective franchise, thereby leaving her without representation in the halls of legislation, he has oppressed her on all sides.

"He has made her, if married, in the eye of the law, civilly dead.

"He has taken from her all right in property, even to the wages she earns.

"After depriving her of all rights as a married woman, if single, and the owner of property, he has taxed her to support a government which recognizes her only when her property can be made profitable to it.

"He has monopolized nearly all the profitable employments, and from those she is permitted to follow, she receives but a scanty remuneration. He closes against her all the avenues to wealth and distinction which he considers most honorable to himself. As a teacher of theology, medicine, or law she is not known.

"He has denied her the facilities for obtaining a thorough education, all colleges being closed against her.

"He allows her in Church, as well as State, but a subordinate position, claiming apostolic authority for her exclusion from the ministry, and, with some exceptions, from any public participation in the affairs of the Church.

"Among the resolutions passed by the convention were the following, the only one which occasioned much discussion being that upon suffrage.

"*Resolved*, That the same amount of virtue, delicacy, and refinement of behavior that is required of woman in the social state should also be required of man, and the same transgressions should be visited with equal severity on both man and woman.

"*Resolved*, That it is the duty of the women of this country to secure to themselves their sacred right to the elective franchise."

It will be seen that the Declarations and Resolutions in this very first convention demanded all the most radical friends of the movement have since claimed, such as equal rights in the universities, in the trades and professions; the right to vote; to share in all political offices, honors, and emoluments; to complete equality in marriage; to personal freedom, property, wages, children; to make contracts; to sue and be sued; and to testify in courts of justice. At this time the condition of married women under the common law was nearly as degraded as that of the slave on the Southern plantation.

Since 1843 the work of the advocates of woman suffrage has been to make good the claims set forth at Seneca Falls. To this end they have held conventions, organized associations all over the country, instituted courses of political study in their equal suffrage clubs, in preparation for their exercise of political functions, circulated petitions, sent out lecturers, worked to change laws through various State legislatures and in constitutional conventions, through amendments to State constitutions, and through their national associations, sought to secure from Congress the submission of an

amendment to the National Constitution enfranchising the women of the United States.

For many years this was carried forward by individuals working through other associations. Finding the work for woman suffrage was

hampered by its close association with the question of negro suffrage, **Associations,** and the Fifteenth Amendment to the National Constitution, those who felt strongly that the woman's

hour had come and that she should not be made to wait until all sorts and conditions of men had first been admitted to the political kingdom, organized in May, 1869, in New York, the National Woman Suffrage Association, with Elizabeth Cady Stanton as president, her co-worker Susan B. Anthony being on the official board. This organization bent its efforts chiefly toward national legislation to secure its object.

In November of the same year, in Cleveland, O., there was formed the American Woman Suffrage Association, with Henry Ward Beecher president, and Lucy Stone and Henry B. Blackwell among its active workers. In 1889 these two bodies of workers joined and formed the National American Woman Suffrage Association, with Elizabeth Cady Stanton as its president, Susan B. Anthony vice president-at-large, and Lucy Stone chairman of the executive committee. This society has its active auxiliary associations in 41 States and Territories, with national headquarters in New York City. In its ranks are to be found all the active workers for the equal political rights of woman.

In December, 1869, the Territorial Assembly of Wyoming enfranchised the women of that Territory upon exactly the same terms as men, giving them the right to serve on juries and hold all territorial offices in the gift of the voters. In 1870 the grand and petit juries at Laramie were composed of both men and women, and the results were eminently satisfactory to all except the convicted criminals. The presiding judge, Chief Justice Howe, gave this as his opinion: "In eighteen years' experience I have never had as fair, candid, impartial, and able a jury in court as in this term in Albany County;" and Associate Justice Kingman said: "For twenty-five years it has been an anxious study with me, both on the bench and at the bar, how we are to prevent jury trials from degenerating into a perfect burlesque; and it has remained for Albany County to point out the remedy and demonstrate the cure for this threatened evil."

When, in 1890, Wyoming prepared her Constitution for Statehood, the women stood upon precisely the same political footing as the men, and this attitude was maintained even when, in the United States Congress, opposition was made to her admission as a State unless the men were willing to yield the point and leave Wyoming's women disfranchised. Wyoming is, therefore, the first true republic, the first star upon the woman suffrage flag.

In 1893 Colorado enfranchised her women by a legislative enactment ratified at the polls, at which election the majority in favor of woman suffrage was 6000. The women there have not

been slow to use their newly acquired opportunity, and have already become a power in public affairs. In the elections this spring in Denver (1897), they have cooperated successfully with the organizations struggling heretofore unsuccessfully for a better city government, and have won a notable victory over the gambling and saloon element which has had control there. That there has been no rush for office by the women is shown by the fact that the women's organizations which helped so effectually to win this victory for law and order asked for not a single name of a woman upon the list of nominations made by them in joint session with the men's organization.

In the now nearly four years of women's voting in Colorado, five women have been elected to the Legislature there. The first bill introduced by a woman as a member of that body was by Carrie Clyde Holly, to raise the age of consent from 16 to 21 years; there was so much opposition from the male members of the Legislature that it was finally compromised to stand at 18.

The women of Utah have now the full franchise, secured to them in the Constitution with which Utah came in as a State in 1896. As early as 1870 they had been enfranchised by the Territorial Legislature, but were disfranchised by Congress (Edmunds Bill) in 1887. This was done as a blow to polygamy; but it was questionable justice to disfranchise all the women of the territory, Mormon and non-Mormon alike, when in reality it can be only men who are polygamists, no woman of them all having more than one husband. The fall election of 1896 placed one woman, Martha Hughes Cannon, in the Utah Senate.

Idaho, by an amendment to its Constitution, passed in November, 1896, gave its women the ballot on the same terms with the men of the State. No election has taken place since then to show the interest the new citizens feel in public affairs; but as the women there labored earnestly for their own enfranchisement, it is but fair to expect them to use their hardy won right.

Kansas women received the municipal suffrage by legislative enactment in 1887; this, of course, does not enfranchise all the women of that State, as those outside of the cities cannot vote except upon certain elective trusteeships and upon school bonds and appropriations. Thousands of the Kansas women vote in the cities, **Limited Suffrage.** and there have been 14 women elected as mayors of small cities, and at one time two such municipalities boasted their entire City Council as made up of women, with a woman mayor to cooperate with them. In most such cases the women were elected to cope with some difficulty of municipal government with which the men hesitated to deal on account of rendering themselves unpopular in a business way. In all such the records show that the women solved the difficulty, and then willingly returned to private life at the next election.

In 19 States and two Territories, women vote for all trustees and directors where elective, which in most cases includes school directors.

These are Connecticut, Delaware, Illinois, Kansas, Kentucky, Massachusetts, Michigan, Minnesota, Montana, Nebraska, New Hampshire, New York, North Dakota, Ohio, Oregon, South Dakota, Vermont, Washington, and Wisconsin, and the Territories of Arizona and Oklahoma.

In Kentucky, women can vote on school appropriations and bonds, provided they live in the country districts and are either widows or spinsters. Just why spinsters should be more interested in the schools than mothers is a mystery, and also why widows should have more rights in this direction than should mothers of children, even if their husbands *are* alive; but the mind of the average legislator is apt to be mysterious to the layman, and especially to the laywoman.

On this question of appropriations, women vote (in addition to Kentucky, on conditions named above) on the same conditions as the men in Iowa, Kansas, Michigan, Minnesota, Nebraska, New Jersey (the only vote they have there), North Dakota, and Vermont.

In Louisiana and Montana they vote as to public improvements if they are taxpayers.

Among the results of the struggle of the last 50 years for the enfranchisement of women may fairly be claimed the great improvement in her legal status (see article WOMAN'S RIGHTS), a marked change in morals looking toward the same standard for man and woman, her admission to most of the great institutions of learning, and to the professions and business life. In many cases these advantages, where they involved legislation to bring them about, were given, as compromises to women asking enfranchisement, by men unwilling to grant rights, but anxious to quiet the demands for that right which, once gained and exercised, will guarantee to its possessors all other rights which may come through law.

RACHEL FOSTER AVERY.

WOMAN'S WORK AND WAGES.—(For the economic and social position of woman in primitive, classic, and medieval times, see FAMILY; MARRIAGE; DIVORCE; WOMAN'S RIGHTS; CHRISTIANITY AND SOCIAL REFORM; CHURCH AND SOCIAL REFORM. For woman's legal status today, see WOMAN'S RIGHTS.) We here consider alone woman's industrial condition in modern times.

Woman's work has changed with economic changes. Previous to the introduction of machine industry, woman played perhaps a more important part in economic production than today, but was not a wage-worker. Industry was carried on largely in the home, each family being largely self-sustaining, doing its own spinning, weaving, brewing, cheese and butter making. Woman played naturally a large part in this life, but as wife or daughter or as household maid, not as a wage-worker in the modern sense. Her industrial position was often severe, but honorable, and approximately equal with man's. In New England, in 1791, Mr. Hamilton, in his report to Congress, on manufactures, speaks of the vast scene of household manufacturing which contributes more largely to the supply of the community than could be imagined without having it made an object of

particular inquiry. Great quantities of coarse cloths, coatings, serges, and flannels, linsey-woolseys, hosiery of wool, cotton, and thread, coarse fustians, jeans and muslins, checked and striped cotton and linen goods, bedticks, coverlets and counterpanes, tow linens, coarse shirtings, sheetings, toweling and table linen, and various mixtures of wool and cotton, and of cotton and flax, were made in the household way, and, in many instances, to an extent not only sufficient for a supply of the families in which they were made, but for sale, and even in some cases for exportation. To less extent the same was true of England, tho here production was earlier specialized and localized.

With the development of the factory system, however, this was changed. Production was taken from the home, and woman in the home was left to do only domestic work, to become the domestic drudge. To an extent, however, she followed industry into the factory. The textile factories of England were full of women brought in from the rural districts, or with children sometimes brought from the almshouses. They worked cheaper than men and replaced men. Their pay was the cheapest, their surroundings the worst, the moral tone the lowest. Factory towns and factory labor developed the utmost degradation. This created such a prejudice against factories that when later factories were developed in New England, from 1815-30, women could only be induced to work in them by offer of higher pay. Partly for this reason and in part because popular education was very much farther advanced in America than in industrial England, factory life in the United States started on a higher level than in England. Girls from American homes in factory towns and the surrounding villages worked in the factories and maintained, as shown by *The Lowell Offering*, a high level of character. There was little opening, too, for women in other lines. Harriet Martineau, in 1840, found in America only seven employments open to women—teaching, needlework, keeping boarders, working in cotton mills, in book binderies, type-setting, and household service.

But this gradually changed. The successes of American life developed a growing number of families whose daughters did not need to work for a living, and factory work became despised. Irish and other European and, later, French Canadian families came in to do factory work. On the other hand, growing ideals of woman's rights and woman's independence opened other spheres for women—the store, the office, the studio, and, later, the professions. Woman's admission to professional life was contingent upon her admission to institutions of higher education. In no respect has the century seen greater changes than in this. In the United States in 1803, of 43 academies or higher schools fitting for college in Massachusetts, only three were for girls, tho a few others admitted both girls and boys. The first female seminary was opened by the Moravians at Bethlehem, Pa., in 1749. The first female seminary to approach college rank was Mount Holyoke, opened at South Hadley, Mass., by Mary Lyon in 1836.

First Half
of the
Century.

Vassar College, the next, dates from 1865. In this movement the West led the East. Oberlin College was founded in 1833, open to both men and women. Harvard Annex, affiliated to Harvard College, was not opened till 1879.

This higher education led to professional life, tho in a few instances women entered professional careers in the United States at earlier dates. Mrs. Margaret Draper was connected with the *Massachusetts*

Women in Professions. *Gazette and News Letter* during the Revolutionary War. The first *daily* newspaper in the world is said to have been established and edited in London, Eng., by a woman, *The Daily Courant*, by Elizabeth Malet. In 1841 Mrs. Lydia Maria Child edited the *Anti-Slavery Standard*.

In medicine the pioneer names are Harriet K. Hunt, of Boston, who from 1822-72 practised medicine without a diploma, and, above all, Elizabeth Blackwell (*q.v.*), who, after a long struggle, received a diploma at Geneva, N. Y., in 1849. Mr. Gregory, of Boston, opened a so-called school of medicine for women in 1848, but the first adequate woman's medical institution was Miss Blackwell's New York Infirmary, chartered in 1854. Women from earliest times had been midwives and nurses; but the New England Hospital first announced the training of nurses in 1863. By 1886 there were 29 training schools for nurses.

In law Mistress Brut seems to have practised in Baltimore in 1647. After her the first woman lawyer in the United States was Arabella A. Mansfield, of Mount Pleasant, Ia., who was admitted to the bar in 1864. By 1879, women were allowed to plead before the Supreme Court of the United States.

In the ministry, after the preaching of Anne Hutchinson, in Boston, in 1634, of Lucretia Mott (*q.v.*) among the Friends, and Anne Lee among the Shakers in 1770, no women seemed to have preached till recent years, tho among the Primitive Methodists and similar bodies women always exhorted. Rev. Antoinette Brown Blackwell seems to have been the first woman ordained in the United States (in 1852, in the Congregational Church). (For statistics of women's occupations, see article OCCUPATIONS.)

In Great Britain, women are entering professional life only less swiftly than in the United States. An act of 1868 for the first time opened pharmacy to women. The University of Edinburgh here led the way. In 1874 a special medical school for women was opened in London. In 1876 all medical bodies were allowed to open their doors to women. By 1895, 264 British women were registered as duly qualified medical practitioners. As for education, eight out of the ten universities of Great Britain now throw open examinations and degrees to women. Oxford and Cambridge do not, but Hitchin, Girtou, Newnham, and Somerville colleges exist for them, and they are all admitted to most lectures and examinations.

In Europe, women are now admitted to universities in France, Italy, Switzerland, and the Scandinavian countries. Germany is behindhand in this, but the sentiment is changing. Russia, once a leader in woman's higher education, is now reactionary on this point.

Such is, in brief, the general survey of woman's industrial professional position during the century. Perhaps woman's more industrial advance during the century has not been in the professions, but in commerce, as saleswomen, clubs, type writers, etc. Here the change has been almost revolutionary. We come now to consider her economic position.

For the United States, Mr. Carroll D. Wright has summarized the facts as to woman's work and wages in chap. xvi. of his *Industrial Evolution in the United States*.

In 1850 there were 225,298 female and 741,671 male employees in manufacturing industries in the United States—*i.e.*, women furnished 23.30 per cent. In 1890 there were 757,065 females, which was only 17.21 per cent. of the employees. Thus, in manufacturing, women play a relatively less important part than formerly—a larger porportion of their work doubtless being done by machinery. On the other hand, the number of occupations open to women has largely increased; and, taking all bread-earning occupations, the proportion of women to men is steadily gaining.

Mr. Wright argues in the above-mentioned chapter that women are not replacing men, but that men are being freed for other occupations, and that women are in part replacing the children to-day employed to a smaller extent in manufactories than formerly, their employment being prevented by factory laws. This view, however, is not held by all. Mr. Wright says that in 1870, 114,628 children of both sexes were employed in manufacturing industries, and formed 5.58 per cent. of all employees, while in 1890 there were only 120,885 children, or only 2.57 per cent. of the total number. But even on this showing the actual, if not the relative number of children had increased, so that women can scarcely be said to have replaced children, while under article "Child Labor" will be found very serious evidence to show that the census estimate of the number of children employed in 1890 is very considerably too low. In some States and in some industries child labor has been limited by legislation; but it is exceedingly doubtful if this is true of all portions of the country and all manufacturing industries. It must be remembered, too, that Mr. Wright's statement is only of the manufacturing industries. Taking the great number of children now employed in stores, or who sell papers, run errands, etc., in the cities, child labor in the United States has probably not been lessened and women can by no means be said to have replaced children. Mr. Wright further argues that they have not displaced men, because by the census reports a larger proportion of the male population is reported as having occupations in 1890 than in 1870. But having an occupation is by no means synonymous, unfortunately, with having work at one's occupation, which point the census fails to touch. The growing problem of unemployment (*q.v.*), therefore, leaves us still to ask if women working at cheaper wages have not replaced men working at higher wages.

The evidence certainly indicates that it is. A recent bulletin of the Department of Labor of the United States, edited by Mr. Wright, gives the following table:

PERCENTAGE OF MALES AND FEMALES 10 YEARS OF AGE OR OVER IN THE UNITED STATES AT THE CENSUSES OF 1870, 1880, AND 1890, BY CLASSES OF OCCUPATIONS.

CLASSES OF OCCUPATIONS.	1870.		1880.		1890.	
	Males.	Females.	Males.	Females.	Males.	Females.
Agriculture, fisheries and mining.....	93.53	6.47	92.57	7.43	92.46	7.54
Professional service.....	75.14	24.86	70.61	29.39	66.99	33.01
Domestic and personal service.....	57.91	42.09	66.28	33.72	61.76	38.24
Trade and transportation.....	98.39	1.61	96.63	3.37	93.13	6.87
Manufacturing and mechanical industries.....	85.56	14.44	81.52	18.48	79.82	20.18
All occupations.....	85.32	14.68	84.78	15.22	82.78	17.22

Of this table the report says :

"From tables presented it will be seen that the proportion of females 10 years of age or over employed in all occupations in the United States rose in its relation to the whole number employed from 14.68 per cent. in 1870 to 17.22 per cent. in 1890, while the males decreased in proportion from 85.32 per cent. in 1870 to 82.78 per cent. in 1890, fully corroborating the facts obtained in the present investigation that the females are to some extent entering into places at the expense of the males. The causes for this state of affairs will be referred to later on under the appropriate table.

"Looking at particular classes of occupations, we find that the proportion of females engaged in agriculture, fisheries, and mining rose from 6.47 per cent. in 1870 to 7.54 per cent. in 1890; in professional service, from 24.86 per cent. to 33.01 per cent.; but in domestic and personal service there was a drop from 42.09 per cent. in 1870 to 38.24 per cent. in 1890, and a corresponding gain in the proportion of males to the whole number employed from 57.91 per cent. in 1870 to 61.76 per cent. in 1890. In trade and transportation the females show the largest gain, it being from 1.61 per cent. in 1870 to 6.87 per cent. in 1890. This is due to the entry of women into employment as clerks in the trade and transportation departments of business. There has also been a very large gain in the proportion of females engaged in manufacturing and mechanical industries, the percentage being 14.44 in 1870 and 20.18 in 1890. The males, on the other hand, have dropped in proportion from 85.56 per cent. in the former year to 79.82 per cent. in the latter. The fact is absolutely demonstrated, therefore, that the proportion of females, taking all the occupations in the country into consideration, is gradually increasing."

According to the twentieth annual report of the Massachusetts Bureau of the Statistics of Labor (1889) :

"In 1875, the males formed 73.19 per cent. and the females 26.81 per cent. of all persons employed in gainful pursuits. In 1885, the males were 66.62 per cent. and the females 33.38 per cent. of the total persons employed. This shows an absolute gain of women in industry of 6.57 per cent., and an industrial displacement of an equal percentage of men. Of the total gain in number of employees from 1875 to 1885, the percentage for males was 46.19 and for females 53.81.

"From 1875 to 1885, the male population increased 17.44 per cent.; in industry, the males increased 20.30 per cent. During the same period the female population increased 17.69 per cent.; the women in industry increased 64.56 per cent. The female net excess was 0.25 per cent. as regards population and 44.26 per cent. as regards representation in gainful pursuits.

"In 1875 there were 19 branches of industry in which women were not employed; in 1885, there were but 8 branches of industry in which women were not employed. In both 1875 and 1885 there were 15 branches of industry in which women were in a preponderance, representing 50 or more per cent. of all persons employed therein."

The same is true of England. According to figures quoted in Mr. Hobson's *Evolution of Modern Capitalism*, drawn from the census and from Mr. Booth's *Occupation of the People*, the number of males engaged in manufactures

in Great Britain increased from 1841-91, 53 per cent., the number of females 221 per cent. In the last decade there seemed a check to this, but it was mainly due to a check in one industry—the cotton trade—and to decay in the linen and lace industries. In every other industry the relative increase of women has been steady. In other branches of the textile and dress industries, which employ 1,319,441 out of 1,840,898 women in industry, the gain of woman labor was marked. Mr. Hobson adds :

"Wherever women have got a firm footing in a manufacture a similar movement is traceable; the relative rate of increase in the employment of women exceeds that of men, even where the numbers of the latter do not show an absolute decline. Such industries are wood furniture and carriages; printing and book-binding; paper, floorcloths, waterproof; feathers, leather, glues; food, drink, smoking; earthenware, machinery, tools. Women have also obtained employment in connection with other industries which are still in the main 'male' industries, and in which no women, or very few, were engaged in 1841. Such are fuel, gas, chemicals; watches, instruments, toys. The only group of machine industries in which their numbers have not increased more rapidly than those of men since 1851 are the metal industries. Over some of these, however, they are obtaining an increased hold. In the 'more mechanical portions' of the growing 'cycle' industry, hollow-ware, and in certain departments of the watchmaking trade, they are ousting male labor, executing with machinery the work formerly done by male hand-workers. . . .

"The recent statistics of tailoring and shoemaking, which are becoming more and more machine industries, mark this movement strongly. In the tailoring trade, while male workers increase from 107,668 in 1881 to 119,496 in 1891, female workers increase from 52,980 to 89,224. In the boot and shoe trade, while men increase from 180,884 to 202,648, women increase from 35,672 to 46,141."

Of the meaning of this development of woman's work we shall speak later. It is necessary first to show what are woman's wages. If women in industry received high wages, all would perhaps be well, but such is not the case.

Women's wages are notoriously low. According to Mr. Wright (see above), women's wages in the cotton factories of New England averaged in 1831 from \$2.20 to \$2.60 per week; in 1880 the average for women ranged as high as \$6.37, **Wages.** and in 1890 in the entire United States it was \$5.53, ranging from \$3.21 to \$6.42. The average annual wages for women clerks in the United States for all industries was, in 1890, \$462; \$890 for men. Women operatives received \$276.

According to Mr. Wright (in the report of the Commissioner of Labor for 1889), the following was the weekly average earnings of women in industries in various cities :

CITIES.	Average Weekly Earnings.
Atlanta.....	\$4.05
Baltimore.....	4.18
Boston.....	5.64
Brooklyn.....	5.76
Buffalo.....	4.27
Charleston.....	4.22
Chicago.....	5.74
Cincinnati.....	4.59
Cleveland.....	4.63
Indianapolis.....	4.67
Louisville.....	4.51
Newark.....	5.10
New Orleans.....	4.31
New York.....	5.85
Philadelphia.....	5.34
Providence.....	5.51
Richmond.....	3.93
St. Louis.....	5.19
St. Paul.....	6.02
San Francisco.....	6.91
San José.....	6.11
Savannah.....	4.99
All cities.....	5.24

The report adds :

"Much is heard at the present time of the very low wages paid working women. It must be clear that they do not rise, on the average, above \$5 per week, or \$5.24 as indicated by this report. The summary by cities, Table XXX., on pages 530 and 531, would seem to indicate that the majority are in receipt of fair wages, when the whole body of working women is considered ; but 373 earn less than \$100 a year, and quite a large number (1212) earn from \$100 to \$150 a year ; that is, the earnings of these women, distributed by weeks over the whole year, do not amount to more than \$2 or \$3 per week. These are the great exceptions, but the figures tell a sad story, and one is forced to ask how women can live on such earnings."

The correctness of this report is supported by the findings of various bureaus and the Bureau of Labor Statistics of Connecticut in 1888. Of 4325 women reported in five principal industries, only one received as much as \$10 per week ; 45 received as much as \$8 ; nearly three fifths of all who worked by the week got only between \$5 and \$6.

And it must be remembered that these are in factories. In the sweating shops, woman's pay is far less. In an article in the *Quarterly Publications of the American Statistical Association* for June, 1895, Miss Isabel Dutton, of the College Settlement Association, mentions girls and women sewing knee pants, 12 seams each, besides the pocket stitching, for from 18 to 22 cents per dozen. Finishers (usually girls) receive from 4 to 7 cents for sewing 120 buttons and making 36 button-holes. (See *TAILORING TRADES*.)

Part VII. of the twentieth annual report of the Massachusetts Bureau of the Statistics of Labor (1889) considered especially women in industry, and comes to the following conclusions, among others :

"In the manufacturing and mechanical industries of the Commonwealth, in 1885, the proportion of female partners was 1 in 16 ; that is, of the whole number of partners, one sixteenth were women.

"In the same industries, and at the same time, the proportion of female stockholders was 1 in 3.69 ; that is, of the whole number of stockholders in manufacturing corporations, more than one fourth were women.

"In 1885 the females were 33.38 per cent. of the total persons employed.

"Of the whole number of persons in industry, 73.97 per cent. were single and 26.03 per cent. were married. Of the males, 67.69 per cent. were single and 32.31 per cent. were married. Of the females, 88.29 per cent. were single and 11.71 per cent. were married. In 1885 as compared with 1875, the increase in married females was 39.64 per cent.

"The females in industry considered were at least 10 years of age. Those from 10 to 13 years of age formed 0.13 per cent. of the total ; from 14 to 19 years of age, 23.19 per cent. ; from 20 to 29 years of age, 41.08 per cent. ; from 30 to 39 years of age, 15.05 per cent. ; 40 years of age and over, 20.55 per cent.

"Of the total female population from 10 to 13 years of age, 0.55 per cent. were engaged in gainful pursuits ; from 14 to 19 years of age, 61.11 per cent. ; from 20 to 29 years of age, 59.77 per cent. ; from 30 to 39 years of age, 30.44 per cent. ; from 40 to 49 years of age, 22.58 per cent. ; from 50 to 59 years of age, 19.79 per cent. ; from 60 to 79 years of age, 21.80 per cent. ; 80 years of age and over, 15.84 per cent. ; those whose ages were unknown, 45 per cent.

"More than one fifth of the women engaged in gainful pursuits in Massachusetts in 1885 were unemployed for a greater or less period during the year.

"The figures given and comparisons made in relation to births, marriages, and deaths show conclusively that the presence of women in industry has not decreased the number of births or marriages, nor increased the number of deaths, for 50 cities and towns, having large percentages of women at work, with 64.39 per cent. of the total population, had 69.99 per cent. of the total number of births, 69.18 per cent. of the whole number of marriages, and but 63.53 per cent. of the total number of deaths.

"Of the whole number of women reporting, 6 were paid less than \$25 per month ; 88, \$25 and under \$50 ; 144, \$50 and under \$75 ; 88, \$75 and under \$100 ; 73, \$100 and under \$200 ; 2, \$200 and under \$300, and 2 a salary in excess of \$300 per month. Forty-eight failed to answer the questions concerning compensation.

"One hundred and fifty reports stated that men received more pay than women for the same grade of work, 95 reported the same pay for women and men, while 5 reported that men received less pay than women, and 202 failed to answer the question."

With these facts before us, there is seen to be a dark side to the boasted advance of woman into industry. If women become wage workers only by the lowering of their fathers', brothers', and husbands' wages, it is doubtful if the total income of families is raised by the woman's wage. And if the family income is not raised, it is doubtful if woman's real social and economic status is raised. Undoubtedly many women are more economically independent of men than they were, and this is doubtless an advantage, but the question is whether this independence cannot be gained without woman's becoming a competitor with man.

The trade-union view is that men's wages should be high enough to maintain a family without their wives or children being compelled to work, and that those women who, unmarried, widowed, or orphaned, need or desire to work should be paid equally with men for equal work. Socialists, however, maintain that this desirable condition is impossible under competition, and that so long as competition lasts, women who can work cheaper than men, because they do not usually have families to support (and the usual condition fixes the rate of wages), will be employed more and more to the exclusion of men. The only way out, therefore, says the socialist, is to raise the condition of both men and women through socialism (*q.v.*), which alone, by replacing competition by cooperation, can save the family, rescue women from low wages and its resultant evils of prostitution (*q.v.*), etc. Extreme individual-

Condition.

Competition with Men.

ists argue that, in the long run, competition will take care of itself ; that women in stores and factories, even at low wages, are better off than in low homes ; that gradually women will come to do what they can do best, and men be forced into those lines which they can follow best. More moderate views assert that women should have a permanent place in industry, but that they should be protected by legislation, and, above all, educated by working women's clubs, trade-unions, etc., toward cooperative and organized effort.

Whichever view be correct, woman's present industrial status is for the large majority bad in the extreme. Says the *Bulletin* above quoted for May, 1897 :

" Out of 782 instances in which men and women work at the same occupation and perform their work with the same degree of efficiency, men receive greater pay in 595, or 76.1 per cent., of the instances, and women receive greater pay in 129, or 16.5 per cent., while in 58 instances, or 7.4 per cent., they receive the same pay

for the same work. The men receive 50.1 per cent. greater pay than the women in the 595 instances in which they are given greater pay, while the women receive but 10.3 per cent. greater pay in the 129 instances in which they are paid higher wages. Out of the 228 instances in which men and children (persons under 18 years of age) work at the same occupation with a like degree of efficiency, men receive greater pay in 182, or 79.8 per cent., of the instances, and children receive greater pay in 24, or 10.5 per cent., while in 22 instances, or 9.7 per cent., they receive the same pay for the same work performed with the same degree of efficiency. The men receive 57.7 per cent. greater pay than the children in the 182 instances in which they are paid more, while the children receive but 8.6 per cent. greater pay in the 24 instances in which they are paid higher wages."

As to the conjugal condition of women in remunerative employment in the United States, the *Bulletin* quoted above (May, 1897) says :

" That the conjugal condition of females 10 years of age or over engaged in each great class of occupations may be ascertained, the following table has been drawn from census results :

NUMBER AND PERCENTAGE OF FEMALES 10 YEARS OF AGE OR OVER IN THE UNITED STATES AT THE CENSUS OF 1890, BY CLASSES OF OCCUPATIONS AND CONJUGAL CONDITION.

CLASSES OF OCCUPATIONS.	SINGLE AND UNKNOWN.		MARRIED.		WIDOWED.		DIVORCED.		Total.
	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.	
Agriculture, fisheries and mining.....	295,148	43.44	152,956	22.51	225,548	33.39	5,871	0.86	679,523
Professional service.....	273,898	87.88	21,649	6.94	14,337	4.60	1,803	0.58	311,687
Domestic and personal service.....	1,164,960	69.85	214,068	12.84	272,109	16.32	16,561	0.99	1,667,698
Trade and transportation.....	187,829	82.23	16,875	7.39	22,219	9.73	1,498	0.65	228,421
Manufacturing and mechanical industries....	811,990	79.05	109,712	10.68	96,055	9.35	9,485	0.92	1,027,242
All occupations.....	2,733,825	69.84	515,260	13.16	630,268	16.10	35,218	0.90	3,914,571

" There is much discussion as to the number and percentage of married women employed in industrial pursuits. The foregoing table gives the facts. It is found that the married women constitute 13.16 per cent. of all the women engaged in the occupations of the country. The largest percentage in any one class of occupations is found in agriculture, fisheries, and mining, where it is 22.51. This is due largely to the fact that in agriculture there are a great many colored women employed. The smallest percentage of married women, 6.94, is to be found in professional service, while in manufacturing and mechanical industries 10.68 per cent. are married."

In Great Britain, the main spheres of woman's economic work may be classified under four heads : (a) domestic service, including work in hotels, etc. ; (b) factory labor, particularly textile work ; to a less extent printing, watch-making, and other chemical works, food-manufacturing, rope-making, rag-picking ; (c) shop service, as shop assistants, dressmakers, milliners, barmaids, and waitresses of all kinds ; (d) home work, in the sweated trades, particularly shirt-making and tailoring.

From the *Final Report of the Labor Commission* it would appear for woman's labor outside of domestic service by statistics carefully collected on pp. 476-504, that the mean of the estimated wages for women and girls in the trades referred to (including 800,000 women out of 1,800,000) was 11s. 5d. per week, a conclusion corroborated by Mr. Giffen's estimate for the commission of 11s. 3½d. Of this conclusion C. G. Robertson, in the *Economic Review* for April, 1895, says.

" The bearing of this statement is only apparent, however, (1) when it is remembered that it includes both women and girls, i.e., young persons under 18 years of age ; (2) when compared with the average rate of men similarly obtained. This is stated to be 24s. 7d. But here it must be borne in mind that the estimate for men does not include the wages of boys ; so that to obtain a fair comparison it is necessary to state the calculation for women alone, which, on Mr. Giffen's estimate, is 12s. 8d. So that, excluding domestic servants, in both cases the average rate of women's wages is 94 per cent. below those of men."

" Another consideration at once suggests itself. It is the average rate which has been stated—what does this mean ? In 13 of the trades selected for making the actual average, the wages of the women rise considerably above the mean as estimated. For example, the wages of shop assistants and barmaids, and the majority of those employed in factories, range from 22s. to 12s. 6d. On the other hand, it must not be forgotten that in several trades, such as the linen trade, the woolen and worsted industries, the wages range from 11s. 6d. to 10s. 2d. Below this come various industries for which the mean is appallingly low. Let me give some examples. Woolen spinners in Leeds make on an average 7s. 6d. a week, and 6s. in Ireland. The average for spike nail-makers in Worcestershire is only 4s. 6d. This is also the mean for straw-plaiters at Luton ; in sack-making it amounts nearly to 7s. 6d. ; and in the trades manufacturing food to 8s. 5d. When we come to the home industries, the same ghastly low rate is equally apparent ; tho it is true that the Lords' Report on the Sweating System fixes the mean for 'sweated' trades at 12s., it must be remembered that this does not cover all home industries. Thus in various cases we find the weekly wage stated to be 2s. 2d., 3s., 3s. 6d., 2s. 4d., and even in one case 1s. 1½d. The full significance of these terrible figures is only grasped when it is pointed out that they are not a mere supplementary wage, but the return for eight, nine, ten hours' work per diem, or even longer."

In some of the trades, however, there is shown to be an upward tendency. In the cotton hosiery and woolen industries this is said

to be 27 per cent.; from 1861-81 in hosiery and carpet, 31 per cent.; in boot and shoe and rope making, 9 per cent. But wages in other industries have either remained stationary or declined, and the still more important fact must be remembered that these statistics refer only to 800,000 women out of 1,800,000, the remaining 1,000,000 being mainly the unorganized and underpaid.

"In the evidence given before Group C of the Labor Commission, in regard to women working, we are informed that in the confectionery trade, the wages range from 5s. a week to 9s. 12s. is the highest paid to a weekly worker."

"In the sack-making trade. 'The ordinary sack of course has to be sewn down both sides and hemmed along the top, and they receive 1s. 7d. per 100 for doing them; and it takes a skilled woman working hard, long hours, two days to do 100. . . . The employers, if they were spoken to about it, would show you the book, and they would say, 'Look how this woman can earn 10s., 12s., or 14s. a week,' and they will show you the book with, against the woman's name, the amount received; but they do not say that that woman has, perhaps, three or four children, and a neighbor's child, working for her and helping her; that is where the falsity of the impression is when you see an employer's book of out-work."

"But the amount paid for shirt-making in London is lower even than this.

"For making shirt fronts ½d. each is paid, and by working very hard a woman can make 12 in a day 10 hours long, thus earning sixpence."

Mr. Sydney Webb says (*Labor in the Longest Reign*):

"Consider, too, the wages which our civilization allots to adult able-bodied women. It is difficult to believe that the 'shilling a day' wages of unskilled women in the East End of London, the 6/- to 7/- a week earned by the Belfast rope maker or tobacco-worker, or even the 10/- or 12/- earned at piecework by the skilled linen-weaver or Glasgow cotton-mill operative, represents any appreciable advance on the scale of the past generation. Women's wages for unskilled labor still gravitate, as a rule, pretty close to the subsistence level, below which they can never have sunk for any length of time. Out of the four millions of women who are working for wages at the present time, a very large percentage must be earning practically no better subsistence than their grandmothers did. It is at least doubtful whether any previous age could show so large a total number at this low level."

Low wages and unhygienic conditions are not the only evil in woman's work. Says a tract on *Woman's Wages*, published by the Humanitarian League of England:

"Illegal fines and exorbitant fines are only too common. Fining for being late, when the work is piecework, is illegal; and tho of course it is undoubtedly necessary to ensure punctuality, it is better to do so in a legal manner, by dismissing the girl. A girl who is lazy does not mind paying a fine half so much as she minds dismissal—it is a more efficient method of reform. But fines are of course more remunerative for the employer, and as the culprit is a woman, he knows she will not have the courage (unless she belongs to a union) to demand her fines back again. Even if, when she arrives late, there is no work for her, the fine is, in some places, deducted from the next day's earnings.

"The fines in the weaving trade for bad work are sometimes enormous. For a fault which it was impossible to prevent, a girl in a mill at Keighley was fined 4s. 6d., and as her wage for weaving the piece was only 3s. 6d., the extra shilling was deducted from the next week's wage. The fines have risen as high in one instance as 12s. out of a wage of 13s. The grievance in cases like this is that frequently no explanation is given as to how the work is bad, and the goods are sold as undamaged.

"A woman for making waistcoats received 2s. 2½d., and was fined 1s. 1d. out of that amount for bad work. She offered to alter the waistcoats if she could only be told how they were defective—the 2s. 2½d. happened to be the whole of her week's wage. But no, this was

not allowed. She received 1s. 1½d., and the waistcoats were sold at full price as undamaged goods.

"Besides all this, however, there is another thing—a matter which surely requires the grave attention of those 'rescue' workers mentioned above. A premium is sometimes put on impropriety of conduct on the women's part by a foreman. That is, a woman who will submit or respond to his coarse jokes and language and evil behavior receives more work than the woman who feels and shows herself insulted by such conduct, and wishes to preserve her self-respect. The pittance earned by some of these women is earned at the expense of more than only hard toil. Even when this coarseness is confined to language only, it causes deep suffering to some of the women. They feel, they know, that because they are women, and therefore regarded as helpless and inferior, they are spoken to as men are not spoken to, and the sting enters their souls. These things it is almost impossible to bring home to any one firm or any foreman; for when the matter is investigated publicly, the women deny it from fear, the overseers of course deny it, and the employer denies it, because he very seldom knows anything about it."

(For this subject, see also PROSTITUTION.) It is often said that great stores where young women are employed in large numbers together with men are hotbeds of every evil. Stories are frequent of young women who can only obtain employment by submitting to indignities from their employers. That this is common is both asserted and denied on good authority. The truth probably is that in aggravated form such cases are not frequent in most stores, and that the ranks of prostitution are not mainly swelled from the great stores and factories. But it is also probably true that if aggravated cases of this kind are not common, what is common indirectly leads to almost the same result. There can be little doubt that girls in stores and factories are subjected to a slow but insidious moral deterioration by the language and manners and treatment of employers, as well as fellow-clerks, and perhaps especially of their immediate department heads.

As to the reasons why women's wages are lower than men's, the following are probably the more effective:

1. The woman is not usually called upon to support a family. She therefore can work cheaper than the married man, and under competition for work is usually compelled to work as cheap as she can.

Woman's work, either as daughter **Reasons for** or as wife, is usually given to add **Low Wages** to the father's or husband's wage. Even those widows who do have to support a family cannot get more wages, because the wage under competition is necessarily fixed by the average.

2. Women often work merely for pin-money, and the effect of the competition of this class brings down the general wage. "Home workers," says an umbrella worker, "are used as a screen for reducing the others." The work done by women in prisons, convents, reform schools, etc., tends to lower the wage of regular workers.

3. Women do not look to industry as a permanent occupation so much as do men. They intend to marry, or at least know that they may marry. Hence they do not organize trade-unions to raise wages.

4. Because they may marry, and for other physical reasons, their work is more intermittent, and therefore sometimes less valuable than man's.

5. They are newer in most industries than men, and therefore usually not so skilled.

6. They are unequal in strength, tho some work they can do better than men.

7. Being inexperienced and often less skilled in industry than men, they have fewer unions and are less capable of trade-union organization than men. Wherever women are organized their wages much more nearly approximate men's. (See WOMAN'S RIGHTS; SOCIALISM; FAMILY.)

In the above-quoted English labor report, where woman's work is most carefully studied, are the following propositions:

"The majority are in favor of strictly enforcing the sanitary clauses of the factories and workshop acts, and of giving the home secretary further statutory powers by which all those workshops not included

Reform Propositions.

under the present law would pass under his control, so that occupiers, owners, contractors, and shopkeepers would be primarily responsible for the condition of their premises and the health of their employees. They would extend the factories acts to include laundries, so far as young persons and sanitary matters are concerned; and they view with satisfaction the recent vigorous step taken by the present home secretary of reinforcing the number of inspectors by women officials, and the regulations framed by the advice of departmental committees for specially unhealthy or dangerous trades. Furthermore, they urge the spread of combination, or trade-unionism, among women, and they advocate the reduction of days in which overtime, under the Factories Act, may be worked by women and young persons—the latter to be forbidden overtime altogether.

"The Minority Report is more explicit. Starting from the statement, with which all must, I think, cordially agree, that 'the economic degradation of the women and girls in many of the industries of the great cities constitutes one of the most serious of industrial problems,' it places the only hope for women in a vigorous system of industry on a collective basis. It would, as immediate steps, regulate by law the hours of all shop assistants, and introduce special legislative changes, like the prohibition of the labor of married women in trades like the white-lead industry, and place laundries under the working of the factory acts."

References: Helen Campbell's *Prisoners of Poverty* (1899). See also the authorities quoted in this article.

WOMEN'S CLUBS, THE GENERAL FEDERATION OF, was incorporated in 1892. It is composed of over 350 women's clubs, having a membership of 50,000 women in the United States and foreign countries. Sorosis, the first woman's club in the United States, was founded in New York City in 1868. The purpose of the Federation is declared in its articles of incorporation to be "to bring into communication with one another the various women's clubs throughout the world, that they may compare methods of work and become mutually helpful. Constitutions of clubs applying for membership should show that no sectarianism or political test is required, and, while the distinctively humanitarian movements may be recognized, their chief purpose is not philanthropic or technical, but social, literary, artistic, or scientific culture." Meetings of the Federation are held biennially. There are 24 State federations (representing some 800 clubs) auxiliary to the General Federation, and 450 single clubs in 41 States. Several foreign clubs are members of the Federation—the Pioneer Club of London, Woman's Club of Bombay, and Educational Club of Ceylon, clubs in South Australia, etc.

WOMEN'S COLLEGE SETTLEMENTS.

—To write with any degree of definiteness or inclusiveness under the title of Women's College Settlements is an impossibility. Altho there are many settlements where a woman is the head worker or the motive power, as in Hull House, Chicago, yet these same settlements number men among their trustees and residents. Many college and university settlements have as valuable residents and committee workers non-collegiate women. Many social settlements number not a few of college graduates. In brief, the settlement movement is at basis one.

The ideals which led women into settlement life are the same which influenced men. Believing that the separation which prevents understanding and sympathy, in many cases between the rich and the poor, between those who have had few opportunities and those who have had many, to be wrong and the source of great evil, they would make that understanding and sympathy possible, that separation impossible. By the establishment of a home in the midst of the working people, not with any spirit of patronage or curiosity, but with a desire for a life of simplicity, with a wish to know as friends those who are bearing a large part in the real work of the world, would the women interested in settlements express their ideals. Their hope has been that their simple home being a real home for the neighborhood, may serve as a wedge toward breaking down class distinctions. "If it shall create any higher ideals or quicken any aspirations, if it shall awaken any soul to a sense of its own nature, the object of a college settlement will surely be attained."

It would seem as if the settlements in England and Scotland submitted to classification under the title of this article better than those in America. The bibliography of college, social, and university settlements compiled by Miss M. Katharine Jones, of the College Settlements Association (edition of 1895), gives the following: A member of one of the leading of these settlements has assured the author at date of writing (April, 1897) that none of great importance have been added to the list since then: St. Margaret's House, 9 Victoria Park Square, Bethnal Green, E. London; Settlement of Women Workers, 461 Barking Road, Canning Town, E. London; Mayfield House, Old Ford Road, Bethnal Green, E. London; Women's University Settlement, 44-46 Nelson Square, Southwark, S.E. London; Women's House of Bermondsey Settlement, 149 Lower Road, Rotherhithe, S.E. London; College of Women Workers, Dartmouth Row, Blackheath Hill, S.E. London; York House, 527 Halloway Road, N. London; University Settlement, Art Museum, Ancoats's Hall, Manchester.

Among the principal of the settlements in America, which may perhaps be classified under the heading of the article, are such as: The Church Settlement House, 1556 Avenue A, New York City; The Nurses' Settlement, 265 Henry Street, New York City; St. Peter's House, 100 Pine Street, Philadelphia; Whittier

Ideals.

House, 174 Grand Street, Jersey City; Kingsley House, 1709 Penn Avenue, Pittsburgh; Social Settlement of Cincinnati, O.; Lucy House, 1835 Carr Street, St. Louis, Mo.; A Log Cabin College Settlement, Grace Post Office, Buncombe County, N. C.; The Manse, 1730 Eighth Street, West Oakland, Cal.

This is by no means an adequate or complete list. There are constant overlappings, and the writer has not been given sufficient time to obtain accurately a list of the new settlements which have sprung up all over the country in the years 1895 and 1896, and which would have a right to be included.

In connection with the subject of women's settlements, it would be a mistake to fail to mention such settlements as Professor Geddes' in Edinburgh; that of the Minster Street Settlement in Philadelphia, and of Chicago Commons, where a family is the nucleus and center of the settlement life. There is, however, a group of settlements in America which come naturally under the heading of women's college settlements. They were established by college women, are controlled by college women, and have a majority of college women as residents.

THE COLLEGE SETTLEMENT ASSOCIATION.

The ideals on which the College Settlements Association are based had been proved practical in England before they were put into definite form in the United States. Its

History.

immediate origin was due to the earnest thought of three college women, all of whom have been more or less closely connected with the work ever since. They were Miss Vida Dutton Scudder, Mrs. Jean Fine Spahr, and Mrs. Helen Rand Thayer. Gradually more and more were drawn into the movement, and a large number of college women give it their direct support. It is the one practical undertaking in which the college women of America are engaged collectively and widely aside from the fellowships of the Association of Collegiate Alumnae.

In February, 1890, the constitution and by-laws of the College Settlements Association were formed. January 5, 1894, the association was incorporated. Its government is vested in an electoral board, the officers of which are a president, a vice-president, a secretary, and a treasurer. The membership is not limited to college women, and any one may become a member by the annual fee of \$5. Each college which contributes through faculty, alumnae, or undergraduates \$100 is entitled to two members on the board—one to represent the alumnae, one the undergraduates. Each member serves for two years. Two electors also are chosen by non-collegiate members. Associate electors to the number of 10 may be elected by the board. Head workers *ex officio* are members of the board, and a delegate is sent to each of the semi-annual meetings in spring and fall from each local committee. The report for 1895-96 shows representation from 11 colleges—Wellesley, Smith, Vassar, Bryn Mawr, Radcliffe, Wells, Packer Institute, Cornell University, Swarthmore, Elmira, Woman's College of Baltimore, and Barnard. The standing committee

of the association consists of the officers *ex officio*, and a fifth member chosen by the board. There are also local executive committees for each settlement, three members on each of which being chosen by the board.

The first settlement of the association was opened at 95 Rivington Street, October, 1889, at about the same time as Hull House, Chicago. Its head workers have been Miss Jean Fine, Miss McLain, and Dr. Jane Elizabeth Robbins. The Philadelphia Settlement was assumed by the association April, 1892. Miss McLain, Miss Dora Freeman, Miss Helena S. Dudley, and Miss Katharine B. Davis have acted as head workers. In December, 1892, Denison House, 93 Tyler Street, Boston, was opened. In October, 1896, it enlarged its quarters by including 91 Tyler Street under its roof. The head worker is Miss Helena S. Dudley. The work of these three settlements differs largely, according to the demands and needs of the neighborhood, and follow social, educational, civic lines, as the case may be. Altho many opportunities have arisen to increase the number of settlements under the control of the College Settlements Association, it has been deemed wise by those in charge to confine the activities of the association to the increased effectiveness of the three until the funds should be greatly augmented and the possibility of obtaining a greater number of effective and permanent workers more certain.

As regards the practical workings of these settlements, each resident pays board varying from \$4.50 to \$6.50 a week. An appropriation is made every year to each settlement from the general fund. There are also local donations. For the year September, 1895, to October, 1896 (thirteen months), the receipts of the general treasurer were \$7784.32. The receipts for each settlement, including the appropriations from this general fund, were as follows: For New York, \$8224.59; for Philadelphia, \$6405.15; for Boston, \$7322.67, which last does not include receipts from board account. The expenses of the association are kept at the minimum. No officer receives a salary, and the chief expenses are for printing and for postage (in part).

Practical Working.

The College Settlements Association have offered fellowships for the study of social and economic problems. These fellowships have been held by Miss Amelia Shapleigh (1892-93); Misses Ada S. Woolfolk, Isabelle Eaton, and Katharine Pearson Woods (1893-94); and Miss Mabel Sanford (1894-95).

The publications of the association have been the Annual Reports, including Lists of Subscribers; the *By-Laws*; *A Study in Dietaries*, Report of Miss Amelia Shapleigh, Fellow (1892-93); *Receipts and Expenditures of Certain Wage-Earners in the Garment Trades*, by Miss Isabelle Eaton, Fellow (1893-94), published by American Statistical Association June, 1895; *A Bibliography of College, Social and University Settlements*, compiled by M. Katharine Jones, first edition October, 1893; second and revised edition October, 1895; *The Work-Shop at Wells Memorial during 1893-94*, by Helena S. Dudley; *Report on Questions Drawn up by*

Present Residents in our College Settlements Association, and Submitted to Past Residents, by Vida D. Scudder, published by the Church Social Union, September, 1896.

CAROLINE WILLIAMSON MONTGOMERY.

WOMEN'S TEMPERANCE ASSOCIATION, THE NATIONAL BRITISH, was organized at Newcastle-on-Tyne in 1876, under the lead of Mrs. Margaret Parker, of Dundee, Scotland, as the result of interest in the Woman's Temperance Crusade in the United States. (See WOMEN'S CHRISTIAN TEMPERANCE UNION.) Mrs. Parker was chosen president, and in 1877 Mrs. C. L. Balfour, succeeded by Mrs. M. Bright Lucas, sister of John Bright. In 1885 the association was affiliated to the World's Women Christian Temperance Union (*q.v.*), of which body Mrs. Lucas was the first president. The pledge of the British Women's Temperance Association is, "I promise by God's help to abstain from all intoxicating drinks, and to try to induce others to do the same."

Mrs. Margaret Bright Lucas was also president of the Bloomsbury branch of the Women's Liberal Association, and in 1892 the British Women's Temperance Association passed the following vote:

Resolved, That all class legislation is unjust, and that therefore responsible women should participate in framing the laws by which they are governed. We hold the spiritual and moral forces of women must be brought to bear directly upon the ballot-box; and in view of the great moral gain that has been realized by granting the municipal and other votes to women, and holding that their vote will always be the enacting clause of all temperance legislation, we ask the parliamentary vote should be extended to them.

In the year 1893-94, 1500 meetings were held by members of the National Executive Committee, and 2000 in all were reported to headquarters; 300 new societies were formed; 8,500,000 pages of literature were issued, including the organ, *The Women's Signal*, which had a circulation of 16,271 per week.

The program of work adopted by the Council for the year 1895 was as follows:

- "1. Evangelistic work, to arouse the conscience of the Christian Church to its responsibilities.
- "2. The preparation and circulation of temperance literature.
- "3. To secure the passing of the Government Liquor Traffic (Local Control) Bill.

- "4. To secure the passing of an imperial measure prohibiting the sale of intoxicating drinks on Sunday.
- "5. To secure the passing of the Grocers' License Abolition Bill.
- "6. To secure the passing of a measure prohibiting the sale of intoxicating drinks to children.
- "7. To secure the closing of public-houses on parliamentary and municipal election days
- "8. To secure effective legislation for the treatment of inebriates.
- "9. To secure the prevention of the hawking of intoxicants in railway stations, and the sale of the same on steam and pleasure boats and ocean steamers.
- "10. To secure the enforcement of the Truck Act.
- "11. The opposing of licenses at Brewster Sessions.
- "12. To secure the election of temperance candidates as poor law guardians, as members of school boards, and all other public bodies.
- "13. To secure scientific instruction in schools.
- "14. To promote the use of unfermented wine at the Sacrament of the Lord's Supper.
- "15. Preventive and reformatory work among women.
- "16. Work among barmaids, and against the employment of women in public-houses, and other demoralizing resorts.
- "17. Work for the prevention of granting liquor licenses to theaters, concert halls, and other places of entertainment.
- "18. Work among municipal women voters, to secure their influence and votes as electors in favor of temperance.
- "19. Prohibiting the sale of intoxicants to native races."

The departments of the association are: Organization; Speakers' Bureau; "Y" (Young Women's) B. W. T. A.; Temperance Legions; Evangelistic; Bible Lessons and Study; Unfermented Wine at the Sacrament; Preventive; Social Purity; Social; Drawing-Room Meetings; Facts; Educational; Health and Hygiene; Adult Schools; High Schools and Private Schools; Legal; Brewster Sessions; Police Matrons; Women as Poor Law Guardians; Members of School Boards, etc.; Work Among Women Municipal Voters; Political; Literature and Press; Inebriate Women; Native Races; Traveling. The Association supports a white-ribbon (publishing) company, an industrial farm home, a retreat for inebriate women, St. Mary's Training Home for Girls Alpha House, a preventive and rescue home. A Scotch Christian Union of the British Women's Temperance Association was organized in 1876. (See WOMEN'S CHRISTIAN TEMPERANCE UNION.)

WOOL.—The statistics of this and the following table are from *The Wool Book*, compiled for the National Association of Wool Manufacturers by S. N. D. North, secretary.

WORKING GIRLS' CLUBS. See WORKING WOMEN'S CLUBS.

WORKING MEN'S CLUBS, apart from labor unions and benefit or friendly societies, are almost unknown in the United States, but have reached a large development in England and on the continent. According to Charles Booth's *Life and Labor of the People* (vol. i.), there are 115 such clubs in East London and Hackney alone. Of these, 32 are usually called "proprietary" clubs, and strictly secret, and have a very shady reputation. Gambling and chiefly betting are their main objects, connected more or less with dancing and dramatic entertainments, being sometimes little better than dancing saloons of the lowest type. They are exposed to police raids, and not long-lived, continually disappearing in one street to appear in another. Thirty-three are philanthropic clubs, more or less supported and superintended by Church and other philanthropic organizations. Prominent among such are the large University Club and the United Brothers. All these except one are teetotal and mainly educational and social.

Thirty-two clubs are political, of which 22 are Liberal and Radical, 6 Conservative, 3 Socialistic, and 1 Irish Home Rule. Of the Conservative Club, only one is called a working man's club, and seven of the Liberal clubs are mainly of the **London** middle class. In all the clubs an unorganized socialism rather than old-fashioned radicalism is the dominant note. All these clubs have a bar, and breweries often help in fitting them up. They also have concerts, lectures, entertainments, dancing, and dramatics. Billiards and whist are greatly played. It is declared by their enemies that they are mere drinking dens, and take the men from their homes; but Mr. Booth declares the former accusation to be without foundation, and that most of the members, if not at the clubs, would be on the street. They give an opportunity for political education such as American workmen are almost without. The American workman is organized for political purposes usually only in the heated campaigns with partizan spirit. The English and European working men's clubs discuss politics all the year round, and to an extent in a broad spirit because they are not merely political. It was to these clubs that the lecturers of the (English) Fabian Society (*q. v.*) went, and largely changed their political spirit from one of cheap negative radicalism to one of constructive evolutionary socialism.

Eighteen of the clubs are social, dancing, dramatic, literary, etc. In all the clubs the fee is usually 6*d.* per month; the average membership is from 300 to 400; the hours are from 6.30 P.M. to 12.30 A.M., and on Sunday from 11 A.M. to 1 P.M. and from 6.30 P.M. to 11.30 P.M. The management is by a committee, and the sale of drinks makes them largely self-supporting. Gambling and excessive drinking in the open clubs are rare.

On the continent also working men's clubs are also very common, but are usually gymnastic, socialistic, or under the patronage of the

WOOLMAN, JOHN, was born at Northampton, N. J., in 1720. His youth was spent on a farm, and he always lived by the labor of his hands, chiefly as a tailor. He began his public ministry at Mount Holly, N. J., about 1742 by teaching poor and neglected children. As a Friend (or Quaker) he spent much of his time traveling and preaching. In a tract, *On the Keeping of Negroes* (two parts, 1753-1862), he pointed out the dangers of slavery. In 1772 he visited England, and died there, at York, in that year, of small-pox. Channing considered his *Journal*, which has been published with an introduction by Whittier, as the purest and sweetest of autobiographies.

WOOLSEY, THEODORE DWIGHT, was born in New York in 1801, and graduated at Yale College in 1820. He read law in Philadelphia; studied theology at Princeton; was tutor at Yale 1823-25; studied languages abroad 1827-30; was elected Professor of Greek at Yale in 1831, and president in 1846; resigned in 1871. His writings on social science are: *An Introduction to the Study of International Law* (1860); *An Essay on Divorce and Divorce Legislation* (1860); *Political Science* (1877); *Communism and Socialism* (1879). He died in 1889.

Church. The Roman Catholic Church has been especially active in this direction. (See SOCIALISM; CHRISTIAN SOCIALISM; COOPERATION.)

In the United States, working men's clubs of the English political type are almost unknown. In the large cities there are numberless ephemeral clubs of boys and young men of the working classes for social purposes purely, and very largely of a low type, like the English proprietary clubs. There are also a growing number of philanthropic clubs connected with churches, settlements, or the Good Government Clubs. (See CHURCH AND SOCIAL REFORM; INSTITUTIONAL CHURCHES; UNIVERSITY SETTLEMENTS; GOOD GOVERNMENT CLUBS.) Many working men also belong to benefit or friendly societies of one kind or another. (See also TRADE-UNIONS.)

WORKING WOMEN'S CLUBS.—A working woman's club or society is an organization formed among busy young women and girls to secure, by cooperation, education, opportunities of social intercourse, and the development of higher and nobler aims in life. They are non-sectarian and self-governing, and they endeavor as far as possible to meet their own expenses by means of fees, entertainments given by the members, sales of articles made in classes, or by good business management in the subletting of club rooms.

In most clubs girls are admitted who have passed the age of fourteen. Some require the indorsement of a club member for admission, others welcome freely all new-comers, believing that the general intelligence and serious purpose of the other members will exclude the unworthy.

The fees in clubs vary from 10 cents to 25 cents a month, while in some clubs yearly fees of \$1 or \$1.50 are preferred.

The advantages of clubs to young working women are pleasant rooms, library and piano, lectures, talks, entertainments and dances, classes in dressmaking, sewing, embroidery, millinery, cooking and domestic science; also, where the city does not provide them, classes in stenography, typewriting, book-keeping and the studies common to the grammar schools. The clubs aim to bring together women from factories, shops and homes, many whom the circumstances of life tend to separate, and by business meetings and discussions to train them all to a better mutual understanding and habits of self reliance.

The clubs are governed by the members for the members. Officers are chosen from the membership of the clubs, and are elected by ballot. Matters of business are presented at monthly business meetings and decided by a majority vote. All questions arising as to the government of the clubs are carefully discussed and settled in the same way.

The following is the usual list of officers: President, vice-president, secretary, assistant secretary, treasurer, assistant treasurer, librarian or steward.

Many clubs are governed by a council consisting of 12 members, including the six officers.

The six members who are not officers are elected by ballot, and hold office two years. This council has general charge and control of the funds and property of the club. The government of individual clubs is always vested in the members of the club.

The movement began in Philadelphia, where a stand has been made for thorough technical training. Florence Nightingale asserts that half the trouble in women's lives results from their lack of **Beginning** training; and Carroll D. Wright gives the same reason the foremost place in summing up the causes why women get lower wages than men.

Clear-headed women in New York City next took up the club idea, and slowly evolved the principles of *cooperation*, *self-government* (by the members for the members), and *the effort for self-support*. This raised the clubs from the demoralizing basis of charity; and it is easy to see how the working of these three principles tends to develop the noblest qualities of self control and self-respect.

The work began in Boston in the present decade, gradually extending through New England. Already there has come the necessity of organizing on a State basis.

The recognized associations of clubs now existing (1897) are the Pennsylvania, New York, Connecticut, Brooklyn, Massachusetts, and Illinois. There are many independent clubs in other States; some, however, are affiliated with these existing associations.

The State association has no control over the methods of individual clubs, claiming only allegiance to the three cardinal principles, independence of other organizations and loyal cooperation for the common good. To put the clubs in close touch and provide for an interchange of experience, there is a board of directors meeting once a month. Each club annually elects one representative to serve on this board. But the chief power is vested in a general council, meeting quarterly, and composed of all the officers of all the clubs belonging.

The junior clubs are inside organizations, consisting of girls under 15 who are too young for the club proper. They use the rooms once a week, pay 10 cents for monthly dues, and generally have separate officers and constitution, the older club members cooperating with them.

Every club does some kind of practical work for the benefit of others, and many societies have regular organizations for this purpose known by different names. The work done is various and interesting. Christmas gifts and pleasures are arranged for poor children who are not reached in other ways, and mothers are also remembered. Boxes and barrels are filled with useful articles made at the clubs and sent to various places where there is need of them. Hospitals are visited, and a variety of articles made at the clubs for the comfort of patients are given. Flowers and fruits are distributed among the sick and suffering poor, also jellies, fresh egg and delicacies. Garments are made and given to day nurseries and other institu-

**Organi-
zation.**

**Forms of
Government.**

tions, where they are greatly needed. Entertainments are held, and the proceeds sent to selected objects, destitute families chosen and provided with special help to tide them over a hard place, and at a few clubs baskets of necessary articles for the sick are provided, and loaned to families where there is sickness. The Three P Circle, working under the words "Purity, Perseverance, Pleasantness," is another inside band of great power.

The Mutual Benefit Fund is an outgrowth of the New York Association, providing for its members in cases of illness or death. In other associations there are small benefit funds connected with individual clubs. The Penny Provident and Stamp Saving Societies have stations in all the associations of clubs.

In summer the members of clubs meet at various vacation houses. Those owned by the Auxiliary Society of Working Girls' Societies of New York, at Miller's Place, Long Island, are the largest. In Connecticut, smaller houses in the country and by the sea, at Sayport, are to be found, while in Massachusetts the club girls gather at Princeton in the largest numbers, and are found also in smaller cottages loaned or presented to individual clubs. The Pennsylvania and Illinois associations have club vacation houses.

Excursions on Saturday afternoons during the summer are another feature of club life.

The clubs vary in membership from 25 to 600, the largest clubs being in Philadelphia. The clubs are beginning to interest themselves more and more in questions relating to the labor of women, such as industrial training schools, trade organizations, shorter hours, consumers' leagues and protective legislation.

These clubs have held three conventions, one in New York in April, 1890, another in Boston in May, 1894, a third in Philadelphia in April, 1897. At the last convention it was decided to form a National League of Working Women's Clubs, but the organization has not yet taken shape.

EDITH M. HOWES.

WRIGHT, CARROLL DAVIDSON, was born in Dunbarton, N. H., in 1840. He began the study of law, but enlisted in the Northern Army in the War of the Rebellion, and became colonel. In 1865 he was admitted to the bar. In 1871 he was State Senator in Massachusetts, and served two years. From 1873-88 he was Chief of the Bureau of Labor Statistics in Massachusetts. In 1875 and 1885 he had charge of the Massachusetts census. In 1888 he was appointed United States Commissioner of Labor. In 1895 he was elected a Professor of Political Science in the Catholic University. Besides his very numerous reports (see Appendix) he has written *Industrial Evolution in the United States* (1892).

X.

XENOPHON was born in Athens in 444 or 434 B.C. Attracted by the teaching of Socrates, his *Memorabilia of Socrates* is his greatest work. He, however, served under Cyrus the younger, in his war against Artaxerxes, and when Cyrus fell (B.C. 401) Xenophon conducted the famous retreat of the 10,000 Greeks to the Black Sea and thence by water to Byzan-

tium. At Coronea, however, Xerxes fought against the Thebans, allies of Athens, and hence was banished from Athens and his property confiscated. He was recalled, however, and died at Athens. His *oikonomikós*, or study of household economics, is the best study of that subject which has come down from ancient Greece. (See POLITICAL SCIENCE; WOMAN'S RIGHTS.)

Y.

YOUNG MEN'S CHRISTIAN ASSOCIATIONS are associations on a specific Christian basis organized for the physical, mental, social and spiritual benefit (a) of their members, and (b) of young men in general. The first organization was made in London in 1844, under the lead of Mr. George Williams. It is now organized in almost all parts of the world, with an International Committee having headquarters in New York City and Geneva, Switzerland. The international conventions have been very large and noteworthy gatherings. The *World Almanac* for 1897 gives the following tables of the number of these associations all over the world, by country and number. It will be noticed that Germany follows the United States in the number of associations, and that Great Britain is rather a poor third:

The total membership of these American associations is 263,298 ; they occupy 315 buildings of their own, valued at \$16,759,800, and have a total net property of \$16,655,014, including 670

libraries, containing 479,563 volumes. They employ 1248 general secretaries and other paid officials, and expended last year for current expenses—local, State and National—\$250,170. In 1872 railroad Y. M. C. A.'s were begun in the United States, and in 1893 numbered 100, with 25,000 members. In 1877 college Y. M. C. A.'s were begun, and in 1893 numbered 500, with 33,000 members. In 1893 the members in England and Wales were 33,563 ; in Scotland, 25,500 ; in Germany, 64,362.

YOUNG WOMEN'S CHRISTIAN ASSOCIATIONS were first organized in London in 1855, an International Association was formed in 1886, and The World's Y. W. C. A. in 1893. In America, 19 States have organized State associations. Each State holds an annual convention. The international convention occurs biennially. Each year four summer schools are held for the training of young women in secretarial and Bible work. *The Evangel*, the official organ of the associations, is published monthly at Chicago, Ill. The second Thursday of October is observed as a day of prayer for young women. A special department is maintained for young women of colleges, and through this department the student volunteer movement is connected with the association work.

General statistics : Number of associations in Great Britain, 1340 ; on the Continent of Europe, 20 ; India, 20 ; Australia, 25 ; America, 345 ; other places, including China and Japan, 175 ; total world, 1570. Membership of American associations, 35,000.

Z.

ZOAR.—The communistic settlement of Zoar was founded in 1817 by a sect from Würtemberg, in Germany, called Separatists. The communistic element, however, was an afterthought, only dating from 1819. Objection to war and to the formalities of the established religion, coupled with a warm welcome from the Quakers of Philadelphia, seem to have drawn them from Germany. Joseph Bäumeler was their main leader till his death in 1853. They allow marriage, maintain family life, and seem broader in their religious views than most of the German communistic sects of America. According to Professor Ely's *The Labor Movement in America* (1886), they then owned several thousand acres of land, had several manufacturing establishments, and property valued at \$1,500,000, with a membership of 390 souls. At present they are said to be prosperous, but smaller in number, and more like a rich corporation than a community.

ZOLLVEREIN (tax union) is the name given to a union of the German States, proposed first by Prussia, and in 1834 entered into by 18 States, according to which all duties were abolished on the frontiers between the States of the union, and the duties on the frontier of the union were divided between the States in proportion to their population. By 1854 all the

principal German States had entered the union. It ended with the formation of the German Empire in 1871.

ZONE-TARIFF SYSTEM.—August, 1889, a new system of railroad fares was introduced in Hungary, called zone-tariff system, in which the rates are fixed, not according to the number of miles traveled by the passenger, but according to the number of zones traversed or entered upon during the journey. Starting from a given center, the railroads are divided into 14 zones or stretches. The first zone includes all stations with 25 kilometers of the center ; the second all more than 25 and less than 40 ; the third, all between 40 and 55 kilometers, etc., each zone after the first up to the twelfth being 15 kilometers long, or, as we should perhaps better say, wide. The twelfth and thirteenth zones are 25 kilometers wide, and the fourteenth includes all stations more than 225 kilometers from the capital. Tickets are sold by zones, being good for all stations within the zone.

Two grades of local tickets were adopted, the first being to the first station and the second to the second. The third station comes within the zone ticket.

A normal fare was adopted per zone (taking 40 cents as the gulden) of 20, 16, and 10 cents per zone, according to the class one uses—first,

second or third. The fare for any zone up to the twelfth is found by simply multiplying the number of zone into this normal rate. The fare for stations in the thirteenth zone is fourteen times the normal rate, except for the second class, in which case it is a trifle less. The fare for stations in the fourteenth zone, which includes all stations more than 225 kilometers, is sixteen times the normal rate, with the exception of second-class fare again, which is a trifle less. The rates between any two adjacent stations, regardless of differences of distance, were 12 cents first class, 6 cents second class, and 4 cents third class, and from any one station to the second station, 16, 9 and 6 cents. For all distances between 140 and 457 miles the stations were grouped with a uniform rate, by ordinary trains, \$3.20, \$2.32 and \$1.60 for the respective classes. By express trains the rates were about 20 per cent. higher. This system, as will be shown in a moment, introduced a great reduction in the average fare and an enormous reduction in the long-distance fare.

Says Professor E. J. James, describing the system in the *Annals of the American Academy of Political and Social Science* (July, 1890):

"The reduction, as compared with the old rates, is enormous. The old rates from Budapest to Kronstadt were 44, 31 and 22 gulden; the new are 8, 5.8 and 4, a reduction of 82 per cent. This represents the extreme reduction, the per cent. of reduction growing smaller as you go nearer to the starting-point. At Klausenburg the old rates were 24, 17 and 12, as compared with the rates just given, the distance being 400 kilometers, a reduction of 66.6 per cent. At Medzo Telegd, a distance of 271 kilometers, the reduction is still more than 50 per cent., and at 100 kilometers the reduction is still nearly 50 per cent., while local reductions have also been very considerable.

"The simplification of the tariff is very great. Under the old system, the number of distinct tickets which had to be kept in every large office was nearly 700. It is now only 92.

"The railroad tickets are now placed on sale like postage stamps at the post-offices, hotels, cigar shops and other convenient places. The public is greatly pleased at the discarding of the complicated machinery of ticket-selling as practised under the old system.

"The most interesting thing, however, in this experiment, is the way in which the passenger traffic has increased under the stimulus of the new rates. The time is too short to enable us to draw definite conclusions, but the facts are striking and significant. The number of passengers during the last five months of

1887 was 2,389,400; during the same period of 1888, was 2,381,200; while for the same period of 1889—the first period under the new system—it was 5,584,600, an increase of over 133 per cent.

The receipts from the traffic under the new system were over 18 per cent. greater than under the old.* In other words, passenger traffic will respond to lower rates, a thing which some railroad managers have denied.

Results.

"Hungary was in some respects the most unfavorable country in Western Europe for such an experiment. It has relatively a small population, scattered over a large territory, poor, ignorant, conservative, the kind of a population not likely to respond quickly to such a thing as a reduction in long-distance railroad fares. The success of the experiment has fixed the attention of railroad managers on the Continent. Austria is about to adopt a somewhat similar system. French, Belgian and German engineers are going to Hungary to study the system on the spot."

Mr. James L. Cowles, writing later in his *A General Freight and Passenger Post* (1896), says:

"The result was that the neighborhood passenger traffic of Hungary increased in the interval, 1889 to 1892, from 2,912,400 to 29,412,100, over 600 per cent., and the long-distance travel increased from 246,200 to 970,600, or 294 per cent.

"One of the results of the reform of the railway system of Hungary has been to throw the burden of railroad expenses on the shoulders of those able to bear it, viz., on the long-distance travelers using express trains, the class corresponding to our Pullman-car travelers. This class, numbering in 1892 about a million, paid over 20 per cent. of the entire passenger taxes. In the United States this class does not pay one half the cost of their own transportation." (See RAILROADS.)

* Since the above paper was read, later figures have been published, showing that up to March 31—i.e., for the first eight months of the experiment—the increase in passenger traffic was 160 per cent. over the traffic in the corresponding eight months under the old system, having risen to 7,770,876 as compared with 2,891,332. The result is still more remarkable with regard to traffic between neighboring stations. Whereas, under the old tariff, only 255,000 persons used the railways for such purpose, their number during the above eight months rose to 4,367,586. It is reported in Budapest that the government is contemplating a still further reduction.

In the *Zeitschrift für Staats u. Volkswirtschaft* (Hertzka's paper) of February 16, 1890, it is stated (p. 10) that this enormous increase in traffic has been handled without any increase in operating expenses. This could be done because the cars under the old system were scarcely ever more than one third full.

APPENDIX

I.

PLATFORMS OF POLITICAL PARTIES IN THE UNITED STATES FOR 1896 NOT PRINTED IN THE TEXT.

PLATFORM OF THE NATIONAL DEMOCRATIC PARTY.
ADOPTED AT INDIANAPOLIS, IND., SEPTEMBER 3, 1896.

This convention has assembled to uphold the principles upon which depend the honor and welfare of the American people, in order that Democrats throughout the Union may unite their patriotic efforts to avert disaster from their country and ruin from their party.

Standard Democratic Principles.—The Democratic party is pledged to equal and exact justice to all men of every creed and condition; to the largest freedom of the individual consistent with good government; to the preservation of the Federal Government in its constitutional vigor, and to the support of the States in all their just rights; to economy in the public expenditures; to the maintenance of the public faith and sound money; and it is opposed to paternalism and all class legislation.

The Chicago Convention Arraigned.—The declarations of the Chicago convention attack individual freedom, the right of private contract, the independence of the judiciary, and the authority of the President to enforce Federal laws. They advocate a reckless attempt to increase the price of silver by legislation to the debasement of our monetary standard, and threaten unlimited issues of paper money by the Government. They abandon for Republican allies the Democratic cause of tariff reform to court the favor of protectionists to their fiscal heresy.

In view of these and other grave departures from Democratic principles, we cannot support the candidates of that convention nor be bound by its acts. The Democratic party has survived many defeats, but could not survive a victory won in behalf of the doctrine and policy it proclaimed in its name at Chicago.

The Republican Party Responsible.—The conditions, however, which make possible such utterances from a national convention are the direct result of class legislation by the Republican party. It still proclaims, as it has for years, the power and duty of government to raise and maintain prices by law, and it proposes no remedy for existing evils except oppressive and unjust taxation.

The Tariff Issue.—The National Democracy here convened, therefore, renews its declaration of faith in Democratic principles, especially as applicable to the conditions of the times. Taxation, tariff, excise or direct, is rightfully imposed only for public purposes and not for private gain. Its amount is justly measured by public expenditures, which should be limited by scrupulous economy. The sum derived by the Treasury from tariff and excise levies is affected by the state of trade and volume of consumption. The amount required by the Treasury is determined by the appropriations made by Congress.

The demand of the Republican party for an increase in tariff taxation has its pretext in the deficiency of revenue, which has its causes in the stagnation of trade and reduced consumption, due entirely to the loss of confidence that has followed the Populist threat of free coinage and depreciation of our money,

and the Republican practice of extravagant appropriations beyond the needs of good government. We arraign and condemn the Populistic conventions of Chicago and St. Louis for their cooperation with the Republican party in creating these conditions which are pleaded in justification of a heavy increase of the burdens of the people by a further resort to protection.

The Tariff Issue.

Protection and Its Ally.—We therefore denounce protection and its ally, free coinage of silver, as schemes for the personal profit of a few at the expense of the masses, and oppose the two parties which stand for these schemes as hostile to the people of the republic, whose food and shelter, comfort and prosperity, are attacked by higher taxes and depreciated money; in fine, we reaffirm the historic Democratic doctrine of tariff for revenue only.

American Shipping.—We demand that henceforth modern and liberal policies toward American shipping shall take the place of our imitation of the restricted statutes of the eighteenth century, which have been abandoned by every maritime power but the United States, and which, to the nation's humiliation, have driven American capital and enterprise to the use of alien flags and alien crews, have made the Stars and Stripes an almost unknown emblem in foreign ports, and have virtually extinguished the race of American seamen.

We oppose the pretense that discriminating duties will promote shipping; that scheme is an invitation to commercial warfare upon the United States, un-American in the light of our great commercial treaties, offering no gain whatever to American shipping, while greatly increasing ocean freights on our agricultural and manufactured products.

The Currency.—The experience of mankind has shown that by reason of their natural qualities, gold is the necessary money of the large affairs of commerce and business, while silver is conveniently adapted to minor transactions, and the most beneficial use of both together can be insured on it by the adoption of the former as a standard of monetary measure, and the maintenance of silver at a parity with gold by its limited coinage under suitable safeguards of law.

Thus the largest possible enjoyment of both metals is gained with a value universally accepted throughout the world, which constitutes the only practical bimetallic currency, assuring the most stable standard, and especially the best and safest money for all who earn their livelihood by labor or the produce of husbandry. They cannot suffer when paid in the best money known to man, but are the peculiar and most defenseless victims of a debased and fluctuating currency, which offers continual profits to the money changer at their cost.

The Currency.

Realizing the truths demonstrated by long and public inconvenience and loss, the Democratic party, in the interest of the masses and of equal justice to all, practically established by the legislation of 1834 and 1853 the gold standard of monetary measurement and likewise entirely divorced the Government from banking and currency issues,

Gold Must be the Standard.—To this long-established Democratic policy we adhere, and insist upon the maintenance of the gold standard and of the parity therewith of every dollar issued by the Government, and are firmly opposed to the free and unlimited coining of silver and to the compulsory purchase of silver bullion.

Government Must Cease the Banking Business.—But we denounce also the further maintenance of the present patchwork system of national paper currency as a constant source of injury and peril. We assert the necessity of such intelligent currency reform as will confine the Government to its legitimate functions, completely separated from the banking business, and afford to all sections of our country a uniform, safe, and elastic bank currency under governmental supervision, measured in volume by the needs of business.

The Cleveland Democratic Administration.—The fidelity, patriotism, and courage with which President Cleveland has fulfilled his great public trust, the high character of his administration, its wisdom and energy in the maintenance of civil order and the enforcement of the laws, its equal regard for the rights of every class and every section, its firm and dignified conduct of foreign affairs, and its sturdy persistence in upholding the credit and honor of the nation, are fully recognized by the Democratic party, and will secure to him a place in history beside the fathers of the republic.

Civil Service Reform.—We also commend the administration for the great progress made in the reform of the public service, and we endorse its effort to extend the merit system still further. We demand that no backward step be taken, but that the reform be supported and advanced until the un-Democratic spoils system of appointments shall be eradicated.

Economy in Public Expenditures.—We demand strict economy in the appropriations and in the administration of the Government.

Arbitration of International Disputes.—We favor arbitration for the settlement of international disputes.

Pensions.—We favor a liberal policy of pensions to deserving soldiers and sailors of the United States.

Integrity of the Supreme Court.—The Supreme Court of the United States was wisely established by the framers of our Constitution as one of the three coordinate branches of the Government. Its independence and authority to interpret the law of the land without fear or favor must be maintained.

We condemn all efforts to degrade that tribunal or impair the confidence and respect which it has deservedly held.

The Maintenance of Public Order.—The Democratic party ever has maintained, and ever will maintain, the supremacy of law, the independence of its judicial administration, the inviolability of contract and the obligations of all good citizens to resist every illegal trust, combination, or attempt against the just rights of property, and the good order of society, in which are bound up the peace and happiness of our people.

Believing these principles to be essential to the well-being of the republic, we submit them to the consideration of the American people.

PLATFORM OF THE DEMOCRATIC PARTY (FREE SILVER). ADOPTED AT CHICAGO, JULY 9, 1896.

We, the Democrats of the United States in national convention assembled, do reaffirm our allegiance to those great essential principles of justice and liberty, upon which our institutions are founded, and which the Democratic party has advocated from Jefferson's time to our own—freedom of speech, freedom of the press, freedom of conscience, the preservation of personal rights, the equality of all citizens before the law, and the faithful observance of constitutional limitations.

During all these years the Democratic party has resisted the tendency of selfish interest to the centralization of governmental power and steadfastly maintained the integrity of the dual scheme of government established by the founders of this republic of republics. Under its guidance and teachings the great principle of local self-government has found its best expression in the maintenance of the rights of the States and in its assertion of the necessity of confining the general government to the exercise of powers granted by the Constitution of the United States.

The Constitution of the United States guarantees to every citizen the rights of civil and religious liberty. The Democratic party has always been the exponent of political liberty and religious freedom, and it re-

news its obligations and reaffirms its devotion to these fundamental principles of the Constitution.

The Money Question.—Recognizing that the money question is paramount to all others at this time, we invite attention to the fact that the Constitution names silver and gold together as the money metals of the United States, and that the first coinage law passed by Congress under the Constitution made the silver dollar the money unit of value and admitted gold to free coinage at a ratio based upon the silver dollar unit.

Demonetization Act of 1873 Condemned.—We declare that the Act of 1873 demonetizing silver without the knowledge or approval of the American people has resulted in the appreciation of gold and a corresponding fall in the prices of commodities produced by the people; a heavy increase in the burden of taxation and of all debts, public and private; the enrichment of the money-lending class at home and abroad; the prostration of industry and impoverishment of the people.

Opposed to Gold Monometallism.—We are unalterably opposed to monometallism, which has locked fast the prosperity of an industrial people in the paralysis of hard times. Gold monometallism is a British policy, and its adoption has brought other nations into financial servitude to London. It is not only un-American, but anti-American, and it can be fastened on the United States only by the stifling of that indomitable spirit and love of liberty which proclaimed our political independence in 1776 and won it in the War of the Revolution.

Free Silver Coinage.—We demand the free and unlimited coining of both silver and gold at the present legal ratio of 16 to 1, without waiting for the aid or consent of any other nation. We demand that the standard silver dollar shall be a full legal tender equally with gold for all debts, public and private, and we favor such legislation as will prevent for the future the demonetization of any kind of legal tender money by private contract.

We are opposed to the policy and practice of surrendering to the holders of the obligations of the United States the option reserved by law to the Government of redeeming such obligations in either silver coin or gold coin.

The Bond Issues.—We are opposed to the issuing of interest-bearing bonds of the United States in time of peace and condemn the trafficking with banking syndicates, which in exchange for bonds and at an enormous profit to themselves supply the Federal Treasury with gold to maintain the policy of gold monometallism.

National Bank Currency Opposed.—Congress alone has the power to coin and issue money, and President Jackson declared that this power could not be delegated to corporations or individuals. We therefore denounce the issuance of notes intended to circulate as money by National banks as in derogation of the Constitution, and we demand that all paper which is made a legal tender for public and private debts, or which is receivable for duties to the United States shall be issued by the Government of the United States, and shall be redeemable in coin.

The Tariff.—We hold that tariff duties should be levied for purposes of revenue, such duties to be so adjusted as to operate equally throughout the country and not discriminate between class or section, and that taxation should be limited by the needs of the Government, honestly and economically administered. We denounce as disturbing to business the Republican threat to restore the McKinley law, which has twice been condemned by the people in National elections, and which, enacted under the false plea of protection to home industry, proved a prolific breeder of trusts and monopolies, enriched the few at the expense of the many, restricted trade, and deprived the producers of the great American staples of access to their natural markets.

The Supreme Court Criticized.—Until the money question is settled we are opposed to any agitation for further changes in our tariff laws, except such as are necessary to meet the deficit in revenue caused by the adverse decision of the Supreme Court on the income tax. But for this decision by the Supreme Court, there would be no deficit in the revenue under the law passed by a Democratic Congress in strict pursuance of the uniform decisions of that court for nearly 100 years, that court having in that decision sustained Constitutional objections to its enactment which had previously been overruled by the ablest judges who have ever sat on that bench. We declare

The Money Question.

The Supreme Court Criticized.

that it is the duty of Congress to use all the Constitutional power which remains after that decision, or which may come from its reversal by the court as it may hereafter be constituted, so that the burdens of taxation may be equally and impartially laid, to the end that wealth may bear its due proportion of the expenses of the Government.

Regulation of Immigration.—We hold that the most efficient way of protecting American labor is to prevent the importation of foreign pauper labor to compete with it in the home market, and that the value of the home market to our American farmers and artisans is greatly reduced by a vicious monetary system which depresses the prices of their products below the cost of production, and thus deprives them of the means of purchasing the products of our home manufactures; and as labor creates the wealth of the country, we demand the passage of such laws as may be necessary to protect it in all its rights.

Arbitration in Railway Labor Disputes.—We are in favor of the arbitration of differences between employers engaged in interstate commerce and their employees, and recommend such legislation as is necessary to carry out this principle.

Trusts and Pools.—The absorption of wealth by the few, the consolidation of our leading railroad systems, and the formation of trusts and pools require a stricter control by the Federal Government of those arteries of commerce. We demand the enlargement of the powers of the Interstate Commerce Commission and such restrictions and guarantees in the control of railroads as will protect the people from robbery and oppression.

Economy in Public Expenditures.—We denounce the profligate waste of the money wrung from the people by oppressive taxation and the lavish appropriations of recent Republican Congresses, which have kept taxes high, while the labor that pays them is unemployed and the products of the people's toil are depressed in price till they no longer repay the cost of production. We demand a return to that simplicity and economy which befit a democratic Government and a reduction in the number of useless offices, the salaries of which drain the substance of the people.

Federal Intervention in Local Affairs.—We denounce arbitrary interference by Federal authorities in local affairs as a violation of the Constitution of the United States, and a crime against free institutions, and we especially object to government by injunction as a new and highly dangerous form of oppression by which Federal judges, in contempt of the laws of the States and rights of citizens, become at once legislators, judges, and executioners, and we approve the bill passed at the last session of the United States Senate, and now pending in the House of Representatives, relative to contempts in Federal Courts and providing for trials by jury in certain cases of contempt.

The Pacific Railroad.—No discrimination should be indulged by the Government of the United States in favor of any of its debtors. We approve of the refusal of the Fifty-third Congress to pass the Pacific Railroad Funding Bill, and denounce the efforts of the present Republican Congress to enact a similar measure.

Soldiers' Pensions.—Recognizing the just claims of deserving Union soldiers, we heartily indorse the rule of the present Commissioner of Pensions that no names shall be arbitrarily dropped from the pension roll; and the fact of enlistment and service should be deemed conclusive evidence against disease and disability before enlistment.

Admission of Territories.—We favor the admission of the Territories of New Mexico, Oklahoma, and Arizona into the Union as States, and we favor the early admission of all the Territories having the necessary population and resources to entitle them to Statehood, and while they remain Territories, we hold that the officials appointed to administer the government of any Territory, together with the District of Columbia and Alaska, should be *bona fide* residents of the Territory or District in which the duties are to be performed. The Democratic party believes in home rule and that all public lands of the United States should be appropriated to the establishment of free homes for American citizens.

We recommend that the Territory of Alaska be granted a delegate in Congress, and that the general land and timber laws of the United States be extended to said Territory.

The Monroe Doctrine.—The Monroe Doctrine, as originally declared and as interpreted by succeeding Presidents, is a permanent part of the foreign policy of the United States, and must at all times be maintained.

Sympathy for Cuba.—We extend our sympathy to the people of Cuba in their heroic struggle for liberty and independence.

Rotation in Office.—We are opposed to life tenure in the public service. We favor appointments based upon merit, fixed terms of office, and such an administration of the civil service laws as will afford equal opportunities to all citizens of ascertained fitness.

Presidential Third Term.—We declare it to be the unwritten law of this republic, established by custom and usage of 100 years and sanctioned by the examples of the greatest and wisest of those who founded and have maintained our Government, that no man should be eligible for a third term of the Presidential office.

Improvement of Waterways.—The Federal Government should care for and improve the Mississippi River and other great waterways of the republic, so as to secure for the interior States easy and cheap transportation to tide-water. When any waterway of the republic is of sufficient importance to demand aid of the Government, such aid should be extended upon a definite plan of continuous work until permanent improvement is secured.

Confiding in the justice of our cause and the necessity of its success at the polls, we submit the foregoing declarations of principles and purposes to the considerate judgment of the American people. We invite the support of all citizens who approve them and who desire to have them made effective through legislation for the relief of the people and the restoration of the country's prosperity.

PLATFORM OF THE REPUBLICAN PARTY, ADOPTED AT ST. LOUIS, MO., JUNE 18, 1896.

The Republicans of the United States, assembled by their representatives in national convention, appealing for the popular and historical justification of their claims to the matchless achievements of thirty years of Republican rule, earnestly and confidentially address themselves to the awakened intelligence, experience, and conscience of their countrymen in the following declaration of facts and principles:

The Democratic Administration.—For the first time since the Civil War the American people have witnessed the calamitous consequences of full and unrestricted Democratic control of the Government. It has been a record of unparalleled incapacity, dishonor, and disaster. In administrative management it has ruthlessly sacrificed indispensable revenue, entailed an unceasing deficit, eked out ordinary current expenses with borrowed money, piled up the public debt by \$262,000,000 in time of peace, forced an adverse balance of trade, kept a perpetual menace hanging over the redemption fund, pawned American credit to alien syndicates, and reversed all the measures and results of successful Republican rule. In the broad effect of its policy it has precipitated panic, blighted industry and trade with prolonged depression, closed factories, reduced work and wages, halted enterprise, and crippled American production while stimulating foreign production for the American market. Every consideration of public safety and individual interest demands that the Government shall be rescued from the hands of those who have shown themselves incapable to conduct it without disaster at home and dishonor abroad, and shall be restored to the party which for thirty years administered it with unequalled success and prosperity. And in this connection we heartily indorse the wisdom, patriotism, and the success of the administration of President Harrison.

The Tariff.—We renew and emphasize our allegiance to the policy of protection as the bulwark of American industrial independence and the foundation of American development and prosperity. This true American policy taxes foreign products and encourages home industry; it puts the burden of revenue on foreign goods; it secures the American market for the American producer; it upholds the American standard of wages for the American working man; it puts the factory by the side of the farm and makes the American farmer less dependent on foreign demand and price; it diffuses general thrift and founds the strength of all on the strength of each. In its reasonable application it is just, fair, and impartial, equally opposed to foreign control and domestic monopoly, to sectional discrimination, and individual favoritism.

We denounce the present Democratic tariff as sectional, injurious to the public credit, and destructive to business enterprise. We demand such an equitable tariff on foreign imports which come into competition

with American products as will not only furnish adequate revenue for the necessary expenses of the Government, but will protect American labor from degradation to the wage level of other lands. We are not pledged to any particular schedules. The question of rates is a practical question, to be governed by the conditions of the time and of production; the ruling and uncompromising principle is the protection and development of American labor and industry. The country demands a right settlement, and then it wants rest.

Reciprocity and Protection.—We believe the repeal of the reciprocity arrangements negotiated by the last Republican administration was a national calamity, and we demand their renewal and extension on such terms as will equalize our trade with other nations, remove the restrictions which now obstruct the sale of American products in the ports of other countries, and secure enlarged markets for the products of our farms, forests, and factories.

Protection and reciprocity are twin measures of Republican policy, and go hand in hand. Democratic rule has recklessly struck down both, and both must be reestablished. Protection for what we produce; free admission for the necessities of life which we do not produce; reciprocal agreements of mutual interests which gain open markets for us in return for our open market to others. Protection builds up domestic industry and trade and secures our own market for ourselves; reciprocity builds up foreign trade and finds an outlet for our surplus.

Protection for Sugar Growers.—We condemn the present administration for not keeping faith with the sugar producers of this country. The Republican party favor such protection as will lead to the production on American soil of all the sugar which the American people use, and for which they pay other countries more than \$300,000,000 annually.

Wool and Woolens.—To all our products—to those of the mine and the field as well as those of the shop and the factory—to hemp, to wool, the product of the great industry of sheep husbandry, as well as to the finished woolsens of the mills, we promise the most ample protection.

The Merchant Marine.—We favor restoring the early American policy of discriminating duties for the rebuilding of our merchant marine and the protection of our shipping in the foreign carrying trade, so that American ships—the product of American labor employed in American shipyards, sailing under the Stars and Stripes, and manned, officered, and owned by Americans—may regain the carrying of our foreign commerce.

The Currency Question.—The Republican party is unreservedly for sound money. It caused the enactment of the law providing for the resumption of specie payments in 1879; since then every dollar has been as good as gold. We are unalterably opposed to every measure calculated to

The Currency Question.

debase our currency or impair the credit of our country. We are therefore opposed to the free coinage of silver except by international agreement with the leading commercial nations of the world, which we pledge ourselves to promote, and until such agreement can be obtained the existing gold standard must be preserved. All our silver and paper currency must be maintained at parity with gold, and we favor all measures designed to maintain inviolably the obligations of the United States, and all our money, whether coin or paper, at the present standard, the standard of the most enlightened nations of the earth.

Liberal Pensions for Soldiers.—The veterans of the Union armies deserve and should receive fair treatment and generous recognition. Whenever practicable they should be given the preference in the matter of employment, and they are entitled to the enactment of such laws as are best calculated to secure the fulfillment of the pledges made to them in the dark days of the country's peril. We denounce the practice in the Pension Bureau, so recklessly and unjustly carried on by the present administration, of reducing pensions and arbitrarily dropping names from the rolls, as deserving the severest condemnation of the American people.

Foreign Relations.—Our foreign policy should be at all times firm, vigorous, and dignified, and all our interests in the Western Hemisphere carefully watched and guarded. The Hawaiian Islands should be controlled by the United States, and no foreign power should be permitted to interfere with them; the Nicaraguan Canal should be built, owned, and operated by the United States, and by the purchase of the Danish

Islands we would secure a proper and much-needed naval station in the West Indies.

The Armenian Massacres.—The massacres in Armenia have aroused the deep sympathy and just indignation of the American people, and we believe that the United States should exercise all the influence it can properly exert to bring these atrocities to an end. In Turkey, American residents have been exposed to the gravest dangers and American property destroyed. There and everywhere American citizens and American property must be absolutely protected at all hazards and at any cost.

The Monroe Doctrine.—We reassert the Monroe Doctrine in its full extent, and we reaffirm the right of the United States to give the doctrine effect by responding to the appeal of any American States for friendly intervention in case of European encroachment. We have not interfered, and shall not interfere, with the existing possessions of any European power in this hemisphere, but these possessions must not, on any pretext, be extended. We hopefully look forward to the eventual withdrawal of the European powers from this hemisphere, and to the ultimate union of all of the English-speaking part of the continent by the free consent of its inhabitants.

Sympathy for Cuba.—From the hour of achieving their own independence the people of the United States have regarded with sympathy the struggles of other American peoples to free themselves from European domination. We watch with deep and abiding interest the heroic battle of the Cuban patriots against cruelty and oppression, and our best hopes go out for the full success of their determined contest for liberty.

Sympathy for Cuba.

The Government of Spain, having lost control of Cuba, and being unable to protect the property or lives of resident American citizens, or to comply with its treaty obligations, we believe that the Government of the United States should actively use its influence and good offices to restore peace and give independence to the island.

Enlargement of the Navy.—The peace and security of the republic and the maintenance of its rightful influence among the nations of the earth demand a naval power commensurate with its position and responsibility. We therefore favor the continued enlargement of the navy and a complete system of harbor and sea-coast defenses.

Foreign Immigration.—For the protection of the quality of our American citizenship, and of the wages of our working men against the fatal competition of low-priced labor, we demand that the immigration laws be thoroughly enforced, and so extended as to exclude from entrance to the United States those who can neither read nor write.

Civil Service Reform.—The civil service law was placed on the statute book by the Republican party, which has always sustained it, and we renew our repeated declarations that it shall be thoroughly and honestly enforced and extended wherever practicable.

Free and Unrestricted Ballot.—We demand that every citizen of the United States shall be allowed to cast one free and unrestricted ballot, and that such ballot shall be counted and returned as cast.

Lynchings.—We proclaim our unqualified condemnation of the uncivilized and barbarous practice, well known as lynching or killing of human beings suspected or charged with crime, without process of law.

Labor Arbitration.—We favor the creation of a National Board of Arbitration to settle and adjust differences which may arise between employers and employed engaged in interstate commerce.

Free Homesteads.—We believe in an immediate return to the free-homestead policy of the Republican party, and urge the passage by Congress of a satisfactory free-homestead measure such as has already passed the House and is now pending in the Senate.

Admission of Territories.—We favor the admission of the remaining Territories at the earliest practicable date, having due regard to the interests of the people of the Territories and of the United States. All the Federal officers appointed for the Territories should be selected from *bona fide* residents thereof, and the right of self-government should be accorded as far as practicable.

Alaska in Congress.—We believe the citizens of Alaska should have representation in the Congress of the United States, to the end that needful legislation may be intelligently enacted.

The Liquor Traffic.—We sympathize with all wise and legitimate efforts to lessen and prevent the evils of intemperance and promote morality.

Woman's Rights.—The Republican party is mindful of the rights and interests of women. Protection of American industries includes equal opportunities, equal pay for equal work, and protection to the home. We favor the admission of women to wider spheres of usefulness, and welcome their cooperation in rescuing the country from Democratic and Populistic mismanagement and misrule.

Such are the principles and policies of the Republican party. By these principles we will abide, and these policies we will put into execution. We ask for them the considerate judgment of the American people. Confident alike in the history of our great party and in the justness of our cause, we present our platform and our candidates in the full assurance that the election will bring victory to the Republican Party and prosperity to the people of the United States.

PLATFORM OF THE PEOPLE'S PARTY, ADOPTED AT ST. LOUIS, MO., JULY 24, 1896.

The People's Party, assembled in national convention, reaffirms its allegiance to the principles declared by the founders of the republic, and also to the fundamental principles of just government as enunciated in the platform of the party in 1892.

We recognize that through the connivance of the present and preceding administrations, the country has reached a crisis in its national life, as predicted in our declaration four years ago, and that prompt and patriotic action is the supreme duty of the hour.

We realize that, while we have political independence, our financial and industrial independence is yet to be attained by restoring to our country the Constitutional control and exercise of the functions necessary to a people's government, which functions have been basely surrendered by our public servants to corporate monopolies. The influence of European money-changers has been more potent in shaping legislation than the voice of the American people. Executive power and patronage have been used to corrupt our legislatures and defeat the will of the people, and plutocracy has thereby been enthroned upon the ruins of democracy. To restore the Government intended by the fathers, and for the welfare and prosperity of this and future generations, we demand the establishment of an economic and financial system which shall make us masters of our own affairs and independent of European control, by the adoption of the following declaration of principles:

The Finances.—1. We demand a national money, safe and sound, issued by the General Government only, without the intervention of banks of issue, to be a full legal tender for all debts, public and private; a just, equitable, and efficient means of distribution, direct to the people, and through the lawful disbursements of the Government.

2. We demand the free and unrestricted coinage of silver and gold at the present legal ratio of 16 to 1, without waiting for the consent of foreign nations.

3. We demand that the volume of circulating medium be speedily increased to an amount sufficient to meet the demands of the business and population, and to restore the just level of prices of labor and production.

4. We denounce the sale of bonds and the increase of the public interest-bearing debt made by the present administration as unnecessary and without authority of law, and demand that no more bonds be issued, except by specific act of Congress.

5. We demand such legislation as will prevent the demonetization of the lawful money of the United States by private contract.

6. We demand that the Government, in payment of its obligations, shall use its option as to the kind of lawful money in which they are to be paid, and we denounce the present and preceding administrations for surrendering this option to the holders of Government obligations.

7. We demand a graduated income tax, to the end that aggregated wealth shall bear its just proportion of taxation, and we regard the recent decision of the Supreme Court relative to the income tax law as a misinterpretation of the Constitution and an invasion of the rightful powers of Congress over the subject of taxation.

8. We demand that postal savings banks be established by the Government for the safe deposit of the savings of the people and to facilitate exchange.

Railroads and Telegraphs.—1. Transportation being a means of exchange and a public necessity, the Government should own and operate the railroads in

the interest of the people and on a non-partizan basis, to the end that all may be accorded the same treatment in transportation, and that the tyranny and political power now exercised by the great railroad corporations, which result in the impairment, if not the destruction of the political rights and personal liberties of the citizen, may be destroyed. Such ownership is to be accomplished gradually, in a manner consistent with sound public policy.

2. The interest of the United States in the public highways built with public moneys, and the proceeds of grants of land to the Pacific railroads, should never be alienated, mortgaged or sold, but guarded and protected for the general welfare, as provided by the laws organizing such railroads. The foreclosure of existing **Railroads and Telegraphs.** liens of the United States on these roads should at once follow default in the

payment thereof by the debtor companies; and at the foreclosure sales of said roads the Government shall purchase the same, if it becomes necessary to protect its interests therein, or if they can be purchased at a reasonable price; and the Government shall operate said railroads as public highways for the benefit of the whole people, and not in the interest of the few, under suitable provisions for protection of life and property, giving to all transportation interests equal privileges and equal rates for fares and freights.

3. We denounce the present infamous schemes for refunding these debts, and demand that the laws now applicable thereto be executed and administered according to their intent and spirit.

4. The telegraph, like the Post Office system, being a necessity for the transmission of news, should be owned and operated by the Government in the interest of the people.

The Public Lands.—1. True policy demands that the National and State legislation shall be such as will ultimately enable every prudent and industrious citizen to secure a home, and therefore the land should not be monopolized for speculative purposes. All lands now held by railroads and other corporations in excess of their actual needs should by lawful means be reclaimed by the Government and held for actual settlers only, and private land monopoly, as well as alien ownership, should be prohibited.

2. We condemn the land grant frauds by which the Pacific Railroad companies have, through the connivance of the Interior Department, robbed multitudes of *bona fide* settlers of their homes and miners of their claims, and we demand legislation by Congress which will enforce the exception of mineral land from such grants after as well as before the patent.

3. We demand that *bona fide* settlers on all public lands be granted free homes, as provided in the National Homestead Law, and that no exception be made in the case of Indian reservations when opened for settlement, and that all lands not now patented come under this demand.

The Referendum.—We favor a system of direct legislation through the initiative and referendum, under proper Constitutional safeguards.

Direct Election of President and Senators by the People.—We demand the election of President, Vice-President, and United States Senators by a direct vote of the people.

Sympathy for Cuba.—We tender to the patriotic people of Cuba our deepest sympathy in their heroic struggle for political freedom and independence, and we believe the time has come when the United States, the great republic of the world, should recognize that Cuba is, and of right ought to be, a free and independent State.

The Territories.—We favor home rule in the Territories and the District of Columbia, and the early admission of the Territories as States.

Public Salaries.—All public salaries should be made to correspond to the price of labor and its products.

Employment to be Furnished by Government.—In times of great industrial depression idle labor should be employed on public works as far as practicable.

Arbitrary Judicial Action.—The arbitrary course of the courts in assuming to imprison citizens for indirect contempt and ruling by injunction should be prevented by proper legislation.

Pensions.—We favor just pensions for our disabled Union soldiers.

A Fair Ballot.—Believing that the elective franchise and untrammelled ballot are essential to a government of, for, and by the people, the People's party condemn the wholesale system of disfranchisement adopted in some States as unrepugnant and undemocratic, and we declare it to be the duty of the several

State Legislatures to take such action as will secure a full, free, and fair ballot and an honest count.

The Financial Question "the Pressing Issue."—While the foregoing propositions constitute the platform upon which our party stands, and for the vindication of which its organization will be maintained, we recognize that the great and pressing issue of the pending campaign, upon which the present election will turn, is the financial question, and upon this great and specific issue between the parties we cordially invite the aid and cooperation of all organizations and citizens agreeing with us upon this vital question.

PLATFORM OF THE PROHIBITION PARTY, ADOPTED AT PITTSBURGH, PA., MAY 23, 1896.

We the members of the Prohibition party, in national convention assembled, renewing our acknowledgment of allegiance to Almighty God as the rightful Ruler of the Universe, lay down the following as our declaration of political purpose:

PLATFORM.

The Prohibition party, in national convention assembled, declares its conviction that the manufacture, exportation, importation and sale of alcoholic beverages has produced such social, commercial, industrial, and political wrongs, and is now so threatening the perpetuity of all our social and political institutions that the suppression of the same by a national party, organized therefor, is the greatest object to be accomplished by the voters of our country, and is of such importance as that it, of right, ought to control the political action of all our patriotic citizens until such suppression is accomplished.

The urgency of this cause demands the union without further delay of all citizens who desire the prohibition of the liquor traffic; therefore,

Resolved, That we favor the legal prohibition by State and national legislation of the manufacture, importation, exportation, and interstate transportation and sale of alcoholic beverages; that we declare our purpose to organize and unite all the friends of prohibition into one party, and in order to accomplish this end we deem it but right to leave every prohibitionist the freedom of his own convictions upon all other political questions, and trust our representatives to take such action upon other political questions as the change occasioned by prohibition and the welfare of the whole people shall demand.

PLATFORM OF THE SILVER PARTY, ADOPTED AT ST. LOUIS, MO., JULY 23, 1896.

First, the paramount issue at this time in the United States is indisputably the money question. It is between the British gold standard, gold bonds, and bank currency, on the one side, and the bimetallic standard, no bonds, government currency (and an American policy), on the other.

Reinstatement of Silver.—On this issue we declare ourselves to be in favor of a distinctively American financial system. We are unalterably opposed to the single gold standard, and demand the immediate return to the constitutional standard of gold and silver, by the restoration by this Government, independently of any foreign power, of the unrestricted coinage of both gold and silver into standard money at the ratio of 16 to 1 and upon terms of exact equality, as they existed prior to 1873; the silver coin to be of full legal tender, equally with gold, for all debts and dues, public and private, and we demand such legislation as will prevent for the future the destruction of the legal tender quality of any kind of money by private contract.

We hold that the power to control and regulate a paper currency is inseparable from the power to coin money, and hence that all currency intended to circulate as money should be issued and its volume controlled by the General Government only, and should be a legal tender.

Opposed to Bond Issues.—We are unalterably opposed to the issue by the United States of interest-bearing bonds in time of peace, and we denounce as a blunder, worse than a crime, the present Treasury policy, concurred in by a Republican House, of plunging the country into debt by hundreds of millions in the vain attempt to maintain the gold standard by borrowing gold; and we demand the payment of all coin obligations of the United States, as provided by existing laws, in either gold or silver coin, at the option of the Government and not at the option of the creditor.

No Over-Production.—The advocates of the gold standard persistently claim that the real cause of our

distress is over-production—that we have produced so much that it made us poor—which implies that the true remedy is to close the factory, abandon the farm, and throw a multitude of people out of employment; a doctrine that leaves us unnerved and disheartened and absolutely without hope for the future. We affirm to be unquestioned that there can be no such economic paradox as over-production and at the same time tens of thousands of our fellow-citizens remaining half clothed and half fed and who are piteously clamoring for the common necessities of life.

Bimetallism.—Over and above all other questions of policy we are in favor of restoring to the people of the United States the time-honored money of the Constitution—gold and silver, not one, but both—the money of Washington and Hamilton, and Jefferson and Monroe, and Jackson and Lincoln, to the end that the American people may receive honest pay for an honest product; that the American debtor may pay his just obligations in an honest standard, and not in a dishonest and unsound standard, appreciated 100 per cent. in purchasing power and no appreciation in debt-paying power, and to the end, further, that silver standard countries may be deprived of the unjust advantage they now enjoy in the difference in exchange between gold and silver—an advantage which tariff legislation cannot overcome.

Bryan and Sewall.—Inasmuch as the patriotic majority of the Chicago Convention embodied in the financial plank of its platform the principles enunciated in the platform of the American bimetallic party, promulgated at Washington, D. C., January 22, 1896, and herein reiterated, which is not only the paramount but the only real issue in the pending campaign, therefore, recognizing that their nominees embody these patriotic principles, we recommend that this convention nominate William J. Bryan, of Nebraska, for President, and Arthur Sewall, of Maine, for Vice-President.

PLATFORM OF THE NATIONAL PARTY, ADOPTED AT PITTSBURGH, PA., MAY 29, 1896.*

The National party, recognizing God as the author of all just power in government, presents the following declaration of principles, which it pledges itself to enact into effective legislation when given the power to do so.

1. *Prohibition.*—The suppression of the manufacture and sale, importation, exportation, and transportation of intoxicating liquors for beverage purposes. We utterly reject all plans for regulating or compromising with this traffic, whether such plans be called local option, taxation, license, or public control. The sale of liquors for medicinal and other legitimate uses should be conducted by the State, without profit, and with such regulations as will prevent fraud or evasion.

2. *Woman Suffrage.*—No citizen should be denied the right to vote on account of sex.

3. *Free Silver Coinage.*—All money should be issued by the General Government only, and without the intervention of any private citizen, corporation, or banking institution. It should be based upon the wealth, stability, and integrity of the nation. It should be a full legal tender for all debts, public and private, and should be of full volume to meet the demands of the legitimate business interests of the country. For the purpose of honestly liquidating our outstanding coin obligations, we favor the free and unlimited coinage of both silver and gold, at a ratio of 16 to 1, without consulting any other nation.

4. *The Public Lands.*—Land is the common heritage of the people, and should be preserved from monopoly and speculation. All unearned grants of land, subject to forfeiture, should be reclaimed by the Government, and no portion of the public domain should hereafter be granted except to actual settlers, continuous use being essential to tenure.

5. *Government Control of Railroads.*—Railroads, telegraphs, and other natural monopolies should be owned and operated by the Government, giving to the people the benefit of the service at actual cost.

6. *Income Tax.*—The national constitution should be so amended as to allow the national revenues to be raised by equitable adjustment of taxation on the properties and incomes of the people, and import duties

* By delegates to the National Prohibition Convention at Pittsburgh, who withdrew because the majority voted to confine the party issues to prohibition. The seceders organized the National party.

Woman Suffrage; Free Silver Coinage.

should be levied as a means of securing equitable commercial relations with other nations.

7. *Convict Labor.*—The contract convict labor system, through which speculators are enriched at the expense of the State, should be abolished.

8. *Sunday.*—All citizens should be protected by law in their right to one day of rest in seven, without oppressing any who conscientiously observe any other than the first day of the week.

9. *The Public Schools.*—The American public schools, taught in the English language, should be maintained, and no public funds should be appropriated for sectarian institutions.

10. *Election of President and Senators by the People.*—The President, Vice-President, and United States Senators should be elected by direct vote of the people.

11. *Liberal Pensions.*—Ex-soldiers and sailors of the

United States army and navy, their widows and minor children, should receive liberal pensions, graded on disability and term of service, not merely as a debt of gratitude, but for service rendered in the preservation of the Union.

12. *Restriction of Immigration and Alien Suffrage.*—Our immigration laws should be so revised as to exclude paupers and criminals. None but citizens of the United States should be allowed to vote in any State, and naturalized citizens should not vote until one year after naturalization papers have been issued.

13. *The Referendum.*—The initiative and referendum, and proportional representation, should be adopted.

14. Having herein presented our principles and purposes, we invite the cooperation and support of all citizens who are with us substantially agreed.

II.

A BIBLIOGRAPHY OF BIBLIOGRAPHIES IN SOCIAL REFORM.

(a) GENERAL BIBLIOGRAPHIES.

THE READER'S GUIDE IN ECONOMIC, SOCIAL, AND POLITICAL SCIENCE. Prepared by R. R. Bowker and George Iles. New York: Putnam's Sons, 1891.

This is still, perhaps, the best general bibliography of the social sciences; but the literature of these sciences has been increasing so fast that this book is already in many ways out of date.

WHAT TO READ. A List of Books for Social Reformers. Published by the (English) Fabian Society. Third edition, revised, London, 1896.

This bibliography, tho small, and tho better for England than the United States, is, on general works and blue books pertaining to economic theory, history, and conditions on socialism and the labor movement generally, undoubtedly the best short bibliography.

THE BEST BOOKS: A Reader's Guide to the Choice of the Best Available Books in all Departments of Literature down to 1890, with the Dates of the First and Last Editions (1891), and First Supplement being the Work down to Midsummer, 1894. London: Sonnenschein, 1894.

This bibliography is good for the best general standard works, but not for detailed reform literature.

DICTIONARY OF POLITICAL ECONOMY. Edited by R. H. I. Palgrave. London: Macmillan, 1893, in progress.

This work is best on strict economic science.

CYCLOPEDIA OF POLITICAL SCIENCE, POLITICAL ECONOMY, AND UNITED STATES HISTORY. Edited by John J. Lalor. Chicago: Rand, McNally & Co., 1882.

This work is good upon United States history.

DICTIONNAIRE D'ÉCONOMIE POLITIQUE. Edited by L. Say and J. Chailley. Paris, 1891-92.

HANDWÖRTERBUCH DER STAATS-WISSENSCHAFTEN. Edited by J. Conrad and others. Jena: Fischer, 1890, in progress.

(b) PARTICULAR SUBJECTS.

ANARCHISM. For bibliographies of the literature of anarchism, see Appendix XI., section "Anarchism," of Ely's *Socialism and Social*

Reform (Boston: Crowell, 1894). See also B. R. Tucker's paper *Liberty*, New York.

CHRISTIAN SOCIALISM. Appendix XI., section "Christian Socialism" of Ely's *Socialism and Social Reform* (Boston: Crowell, 1894). See also Appendix B., section "Christian Socialism," of Bliss's *A Handbook of Socialism*. (London: Sonnenschein, 1895)

COOPERATION. See *What to Read* (Part III.). (Fabian Society, 276 Strand, London, W. C., revised edition, 1896.)

CRIMINOLOGY. Dr. Arthur MacDonald's *Criminology*. (New York: Funk & Wagnalls Co., 1893).

MONEY AND BANKING. See a bibliography in Horace White's *Money and Banking* (Boston: Ginn & Co., 1896). See articles PAPER MONEY; SILVER, for books favorable to more radical views, and see *The Coming Nation*, published at Ruskin, Tenn., for Populist literature.

MUNICIPALISM AND MUNICIPAL REFORM. The report of the proceedings of the National Conference for Good City Government, held in Philadelphia, 1894, contains a valuable bibliography of municipal government and reform.

NATIONALISM. See a list published by B. F. Hunter, 39 Preston Street, Philadelphia, Pa.

SOCIALISM. *Bibliographie des Socialismus und Communismus*. By James Stamhammer (Jena: Fischer, 1893). A most complete European bibliography, giving some 10,000 titles.

Handbuch des Socialismus. By C. Stegmann and C. Hugo (Zurich: Schabelitz, 1894); Appendix to R. T. Ely's *Socialism and Social Reform* (Boston: Crowell, 1894); Appendix to Bliss's *A Handbook of Socialism* (London: Sonnenschein, 1895); *What to Read*, published by the (London) Fabian Society (3d ed., revised, London, 1896).

SOCIAL SETTLEMENTS. See a bibliography compiled by M. Katharine Jones, and published by the College Settlements Association. Address, M. K. Jones, Englewood, N. J.

TECHNICAL EDUCATION. See bibliography in Eighth Annual Report of the Commissioner of Labor of the United States, 1893.

TEMPERANCE. See bibliography in Appendix of *The Foundation of Death: A Study of the Drink Question*, by Axel Gustafson (New York: Funk & Wagnalls Co., 1887); also a brief but up-to-date bibliography in *The Prohibition Handbook*, by G. B. Waldron (New York: Funk & Wagnalls Co., 1896).

TRADE-UNIONS AND THE LABOR MOVEMENT. For America, see Appendix to Bliss's *A Handbook of Socialism* (London: Sonnenschein,

1895); for Great Britain, Sidney and Beatrice Webb's *History of Trade-Unionism* (London: Longmans, 1894).

WOMAN'S RIGHTS, ETC. For America, see Appendix to *Woman's Work in America*, edited by Annie Nathan Meyer (1891); for Great Britain, see a bibliography published by the Women's Progressive Society, 30 Theobald's Road, London, W. C., 1892.

III.

GOVERNMENT STATISTICAL PUBLICATIONS.

(a) United States.

Federal Census Reports.—These decennial reports are of the utmost value. They are also condensed into compendiums, giving the more important statistics.

Statistics of Commerce.—A Bureau of Statistics connected with the Federal Treasury Department issues a series of *Statistics of Commerce and Navigation*, also of *Internal Commerce*. A similar bureau of statistics connected with the State Department issues a series of monthly *Consular Reports*.

Statistics of Education.—The Federal Bureau of Education, under the Interior Department, issues valuable annual reports.

Statistics of Finance.—The Secretary of the Treasury publishes an annual report, giving statistics on a wide range of financial subjects.

Statistics of Labor.—The Department of Labor, with Carroll D. Wright, Commissioner of Labor, at its head, publishes annual and special reports on industrial subjects. The annual reports thus far published have related Industrial Depressions (1886); Convict Labor (1887); Strikes and Lockouts 1881-86 (1888); Working Women in Large Cities (1890); Railroad Labor (1890); Cost of Production, Iron, Steel, Coal, etc. (1891); Cost of Production, Textiles and Glass, two vols. (1892); Industrial Education (1893); Building and Loan Associations (1894); Strikes and Lockouts, 1887-94, two vols. (1895); Work and Wages of Men, Women and Children (1896). Special reports have related to Marriage and Divorce (1889); Labor Laws of the United States (1892, revised edition, 1896); Analysis and Index of all Reports Issued by Bureaus of Labor Statistics in the United States Prior to November 1, 1892 (1893); Compulsory Insurance in Germany, etc. (1893); The Gothenburg System of Liquor Traffic (1893); The Phosphate Industry of the United States (1893); The Slums of Baltimore, Chicago, New York and Philadelphia (1894); The Housing of the Working People (1895).

The department also, since 1896, has issued a monthly bulletin of the Department of Labor, giving résumés of all labor statistical reports by Government bureaus.

Statistics of Production.—The Department of Agriculture publishes monthly and annual reports on agricultural products. The United States Geological Survey issues annual reports on *The Mineral Resources of the United States*. The United States Fish Commission publishes less complete statistics.

Statistics of Railroads.—The Interstate Commerce Commission publishes annual statistics of railroads in the United States.

Statistical Abstracts.—The Chief of the Bureau of Statistics of the Treasury Department publishes a most valuable yearly *Statistical Abstract*, condensing all the statistical information of Government publications.

State Reports.—All the States publish reports of various departments and commissions, some of them of little and some of very great value. This applies to the reports of the various State labor bureaus. An analysis of these down to 1892 forms the Third Special Report of the United States Department of Labor. See above Statistics of Labor.

All Federal and State publications in the United States can be had gratuitously till the editions are exhausted by applying to the departments which issue them.

(b) Great Britain.

Among the more important of the Parliamentary papers of Great Britain are the following, which can be obtained, at prices running usually from 1d. to 1s.,

of the official agents Eyre & Spottiswoode, Fleet Street, London, E. C., who publish a good catalogue. *Annual Reports:* Statistical abstract for the United Kingdom Commercial Labor and Statistical Department of Board of Trade since 1853. *Agriculture:* Returns for Great Britain, with abstract returns for foreign countries. *Birth, Death, and Marriages:* Report of the Registrar-General for England. *Education:* Report of Committee of Council. *Factories and Workshops:* Report of the Chief Inspector. *Finance:* Accounts of the United Kingdom, account of the public income, and expenditure. *Labor:* Report of the Labor Department, also a labor gazette (monthly), *Post-Office and Telegraph.*

Report of Postmaster-General. *Prisons:* Report of Commissioners of. *Railways:* Report of the capital, traffic, expenditure of the railways of the United Kingdom; returns for United Kingdom, with summary tables for the last 15 years. *Savings Banks:* Returns. *Strikes:* Report on strikes and lockouts of the year by the labor correspondent to the Board of Trade. *Trade-Unions:* Report of the labor correspondent to the Board of Trade. *Tramways* (street cars): Return of tramways authorized by Parliament.

Occasional Papers.—*Town Improvements* (betterment) Committee: Report 1894. *Employees' Liability:* Committee 1886. *Hours of Labor, 1850-90. Hours of Labor and Wages in Colonies, 1892. Labor Commission.* Many volumes, including valuable reports on foreign countries; fifth final report; minority report of trade-unionists (Manchester Labor Press). *Report on Employment of Women. Sweating System:* Lords Committee, 1888-89. *Unemployed:* Report on agencies and methods for dealing with unemployed. *Housing of the Working Classes:* Commission 1885.

(c) Other Countries.

The following are the chief general statistical government publications of different countries:

Austria: *Oesterreichisches statistisches Handbuch für die im Reichsrathe vertretenen Königreiche und Länder* [k. k. statistische Central Commission]. Published since 1882.

Belgium: *Annuaire Statistique de la Belgique* [Ministère de l'Intérieur et de l'Instruction Publique].

Denmark: *Danmarks Statistik; Statistisk Aarbog* [Udgivet af Statens Statistiske Bureau]; *Statistique du Danemark; Annuaire Statistique* [Publié par le Bureau de Statistique de l'Etat.] Publication commenced in 1866.

France: *Annuaire Statistique de la France* [Office du Travail, Ministère du Commerce de l'Industrie, des Postes et des Télégraphes]. Published since 1878.

Germany: *Statistisches Jahrbuch für das Deutsche Reich* [Kaiserliches statistisches Amt]. Published since 1880.

Italy: *Annuario Statistico Italiano* [Ministero di Agricoltura, Industria e Commercio, Direzione Generale Della Statistica]. Published since 1878.

New Zealand: *The Journal of the Department of Labor* [Wellington N. Z.]. Published since 1893.

Russia: *Annuaire Statistique de la Russie* [Publication du Comité Central de Statistique, Ministère de l'Intérieur]. Published since 1882.

Sweden: *Sveriges Officiella Statistik i Sammandrag* [Statistisk Tidskrift utgifven af Kungl. Statistiska Centralbyrån]. Published since 1860.

Switzerland: *Statistisches Jahrbuch der Schweiz* [Statistisches Bureau des eidg. Departements des Innern]; *Annuaire Statistique de la Suisse* [Bureau de Statistique du Département Fédéral de l'Intérieur]. Published since 1891.

RISE AND FALL OF WAGES IN THE UNITED STATES.

CHART I.—DAY'S WAGES OF UNSKILLED LABOR.

For the period from 1700-1873 this table is based on figures given in Carroll D. Wright's book, *The Industrial Evolution of the United States*. For the period from 1873-93 the figures given are from Charles B. Spahr's *Present Distribution of Wealth in the United States*. For a discussion of the facts and for contrary views see article WAGES.

CHART II.—CARPENTER'S DAY'S WAGES IN THE NORTH.

The figures given in this chart are based on the same authorities as those used in constructing Chart I.

The chart gives too favorable a view of the carpenter's present economic position, because it does not make any allowance for unemployment. (See articles WAGES and UNEMPLOYMENT in body of the work.)

WAGES AND HOURS OF LABOR IN GREAT BRITAIN.

LENGTH OF THE WORKING DAY IN GREAT BRITAIN.

This chart is based upon facts and figures given in J. E. Thorold Rogers's *Six Centuries of Work and Wages*.

For contrary views, see article **SHORT HOUR MOVEMENT**.

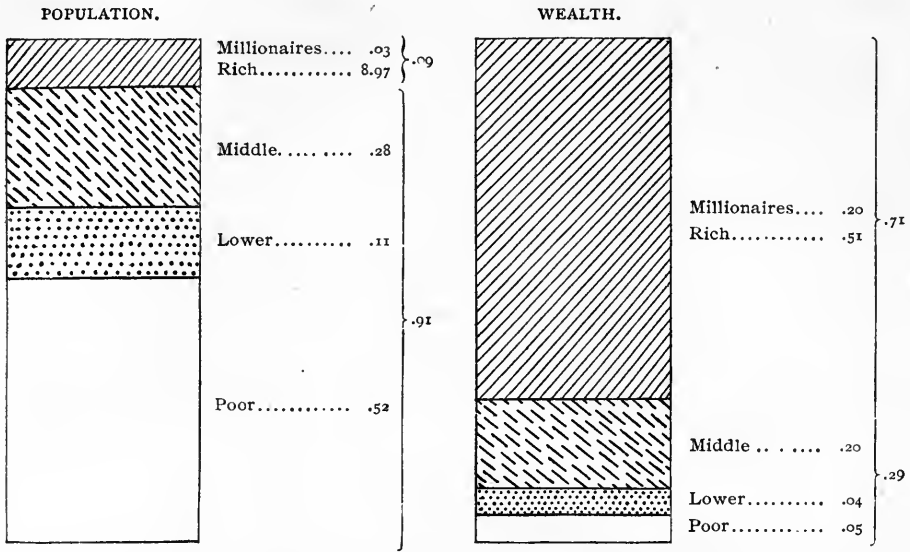

RISE AND FALL OF REAL WAGES (MEASURED BY WHAT THEY WILL BUY) IN ENGLAND.

This chart is based upon Rogers's work, *Six Centuries of Work and Wages*.

For contrary views, see article **WEALTH**.

DISTRIBUTION OF WEALTH IN THE UNITED STATES.

Diagrams showing by percentages the population and wealth distribution in the United States, according to tables compiled by George K. Holmes, United States Census Expert on Mortgage Statistics.

For a full discussion of this subject, see article WEALTH.

PLATFORM OF THE INDEPENDENT LABOUR PARTY OF GREAT BRITAIN.

OBJECT.

An industrial commonwealth founded upon the socialization of land and capital.

METHODS.

The education of the community in the principles of socialism.

The industrial and political organization of the workers.

The independent representation of socialist principles on all elective bodies.

PROGRAM.

The true object of industry being the production of the requirements of life, the responsibility should rest with the community collectively; therefore.

The land, being the storehouse of all the necessities of life, should be declared and treated as public property.

The capital necessary for industrial operations should be owned and used collectively.

Work and wealth resulting therefrom should be equitably distributed over the population.

As a means to this end, we demand the enactment of the following measures:

1. A maximum eight-hour working-day, a six days' working-week, with the retention of all existing holidays, and labor day, May 1, secured by law.

2. The provision of work to all capable adult applicants at recognized trade-union rates, with a statutory minimum of sixpence per hour.

In order to remuneratively employ the applicants, parish, district, borough, and county councils to be invested with powers to:

(a) Organize and undertake such industries as they may consider desirable.

(b) Compulsorily acquire land; purchase, erect, or manufacture buildings, machinery, stock, or other articles for carrying on such industries.

(c) Levy rates on the rental values of the district, and borrow money on the security of such rates for any of the above purposes.

3. State pensions for every person over 50 years of age, and adequate provision for all widows, orphans, sick and disabled workers.

4. Free, secular, primary, secondary and university education, with free maintenance while at school or university.

5. The raising of the age of child-labor, with a view to its ultimate extinction.

6. Municipalization and public control of the drink traffic.

7. Abolition of indirect taxation, and the gradual transference of all public burdens on to unearned incomes with a view to their ultimate extinction.

The I. L. P. is in favor of every proposal for extending electoral rights to both men and women and democratizing the system of government.

A CHRONOLOGY OF SOCIAL REFORMS BY SUBJECTS AND COUNTRIES.

ABOLITION OF SLAVERY AND EXTENSION OF SUFFRAGE.

1790. _____
1792. Mary Wollstonecraft's *Vindication of the Rights of Woman*.
Clarkson, Wilberforce, and others agitate against the slave trade.
